TABLE OF CONTENTS (continued)

1. INTRODUCTION

California Environmental Quality Act (CEQA) Guidelines Section 15155 establishes the standards for assessing the sufficiency of water supplies for new development projects. This section requires the city or county lead agency to identify any water system that either: (A) is a public water system that may supply water to the water-demand project, or (B) that may become such a public water system as a result of supplying water to the water-demand project.[1] As part of the environmental review conducted for a qualifying project pursuant to the CEQA, the public water supplier or land use agency—in this case the Ontario Municipal Utilities Company—must prepare a "water supply assessment" of the reliability of water supplies for the project, considering normal, single dry, and multiple dry years over a 20-year horizon. CEQA Guidelines Section 15155 regulates Water Supply Analysis for defined "water demand projects."

Additionally, California Senate Bill 610 (SB 610) amended existing legal requirements for confirmation of water supply sufficiency as a condition of approval for development projects. The confirmation of water supply sufficiency is achieved through an assessment of the water supplier's existing and future water sources, and existing and projected water demand in relation to a "project" as defined by California Water Code (CWC) section 10912, resulting in the production of a project-specific Water Supply Assessment ("WSA" or "Assessment"). Additional analysis is required in the WSA if any portion of the water supply includes groundwater.

Law

CWC section 10910:

> *(a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.*

CWC section 10912:

For the purpose of this part, the following terms have the following meanings:

(a) "Project" means any of the following:

- *(1) A proposed residential development of more than 500 dwelling units.*
- *(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.*
- *(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.*
- *(4) A proposed hotel or motel, or both, having more than 500 rooms.*

1 CEQA Guidelines, Article 10, Section 15155 Water Supply Analysis.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

1.1 PURPOSE

The Ontario Municipal Utilities Company (OMUC) is a department of the City of Ontario (City) and the water supplier to the City. This WSA document prepared for the City is intended to meet the requirements of CEQA Guidelines Section 15155 and SB 610. This WSA is designed to answer whether the projected supply for the next 20 years, based on normal, single dry and multiple dry years, will meet the demand projected for the Project plus existing and planned future uses, including agricultural and manufacturing uses. The water demand for the Ontario Airport South Airport Cargo Center Project (Project) is calculated and the adequacy of water supplies to meet the Project is evaluated in the following sections.

The Project qualifies as a water demand project under the following definition:[2]

> *"An industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area."*

1.2 BACKGROUND

The Project site is located within Ontario International Airport (ONT or Airport) within the City. The Project site covers 97 acres and is located in the northern portion of the City, immediately north of the City of Chino in San Bernadino County as shown in **Figure 1, Regional Location**. The Project site is located in the southern half of the Airport, immediately west of the Cucamonga Canyon Channel and north of Mission Boulevard, as shown in **Figure 2, Project Site Location**. Most of the Project site is located north of East Avion Street with the remainder located between East Avion Street and Mission Boulevard west of South Hellman Avenue as shown by **Figure 3, Existing Ontario Policy Plan Land Use Designation within Project Site**. **Figure 3** shows the land use designations found within and around the Project site.

The City recently prepared updates to its Water Master Plan and Recycled Water Master Plan in June 2020, which includes the current unit water demand factors for potable and recycled water as well as ultimate buildout water demand projections (AKM and Stantec, respectively). On June 15, 2021, the City adopted its 2020 Urban Water Management Plan (UWMP) (Resolution No. 2021-059), a copy of which is located in **Appendix A.** The projected water demands of the 2020 UWMP are consistent with the City's said master plan updates (copies of the master plans are located in **Appendix B** and **Appendix C**).

2 CEQA Guidelines, Article 10, Section 15155 (a) (1) (E).

1.3 Proposed Project

This WSA has been prepared for the Project as supplemental information to the Project's Environmental Impact Assessment (EIR; State Clearinghouse No. 2021100226). As such, this Project is considered to be "subject to CEQA" pursuant to CWC section 10910.

The Project site is developed with concrete and asphalt pavement areas, buildings, aircraft hangars, and landscaped areas. It slopes slightly from the northwest to the southeast. The surface elevation ranges from approximately 890 to 920 feet above mean sea level.

The Project would replace existing, underutilized airport-related buildings and provide site improvements with an air cargo center. The Project would include demolition of the existing buildings, site improvements, and the development of a new air cargo center in two phases as described further below.

The proposed air cargo center, illustrated in **Figure 4**, **Site Plan**, includes a Cargo Sorting Building, truckyard, parking facilities, aircraft parking apron improvements, ground service equipment (GSE) parking, and aviation support facilities. The Cargo Sorting Building, proposed north of East Avion Street, would contain a sorting facility and office spaces. The aircraft parking apron would surround the building to the west, north, and east. A ground-level visitor parking lot and truckyard are proposed on the south side of the cargo building, with access from East Avion Street. A parking garage for employees is proposed south of East Avion Street with a pedestrian bridge connecting the parking garage to the office building. The Project would be implemented in two phases. Phase 1 would take place on the easternmost 60 acres of the Project site, and Phase 2 would occur on the remaining western 30 acres.

Construction of Phase 1 of the Project is projected to start in the first quarter of 2023 and be completed by the first quarter of 2025. Construction of Phase 2 would start approximately 2 years after the completion of Phase 1, based on market conditions. It is anticipated construction of Phase 2 is assumed to start in the third quarter of 2027 and be completed by 2029.

Project Site Plan

332-001-21

Existing Water Facilities

The Project site is located north of Mission Boulevard within the existing Ontario International Airport and consists of airport uses. The Project site is located within the City's 1212 Pressure Zone for potable water and the existing water system would be used to serve the Project. **Figure 5**, **Existing Potable Water System for the City** below illustrates the existing potable water system within the City, which the Project would utilize.

The Project site is located within the City's 1158 Pressure Zone for recycled water, as shown in **Figure 6**, **Existing Recycled Water System for the City**. City Ordinance No. 2689 requires all new development to connect to and use recycled water for all approved uses, including but not limited to landscape irrigation.[3] To provide a conservative estimate in this water supply assessment, it is assumed no recycled water would be used for this Project, only potable water.

1.4 PROJECT RELATION TO THE URBAN WATER MANAGEMENT PLAN

The City/OMUC is the water supplier for the Project and has adopted the 2020 UWMP, a copy of which is provided in **Appendix A.**[4] This WSA will rely on the 2020 UWMP. The assumptions on ultimate (buildout) water demand in the 2020 UWMP for the Project site were derived from land use-based water demand factors according to the City's 2020 Water Master Plan.

As stated in the 2020 Water Master Plan, "For future developments, water unit demand factors were used to estimate future water use. Potable water unit demand factors are generally based on the factors that were developed as a part of a study completed in May 2016 entitled 'Ultimate Citywide Water Demand Estimate.'[5]

The 2020 UWMP water demand projections are based on the General Plan Land Use Plan (**Figure 3**), which designates the 97-acres Project site as Airport. Water demand for the Project site and the Airport, as a whole, are included in the UWMP 2020 projections under the "Industrial" land use designation.

According to the Water Code, if the water demand for a project has been accounted for in the water supplier's most recent UWMP, then the WSA may use the UWMP as the source of the information required in the WSA. The determination as to whether the Project's water demand has been accounted for in the most recent UWMP is located in **Section 2**, **Water Demand Analysis**.

Relation of Water Supplier to Other Urban Water Management Plans

The City is a member agency of several water suppliers: Inland Empire Utilities Agency (IEUA), Water Facilities Authority (WFA), Chino Basin Desalter Authority (CDA), and San Antonio Water Company (SAWCo). IEUA obtains water from The Metropolitan Water District of Southern California (MWD). In addition, WFA obtains MWD water through IEUA. Each of these water suppliers has adopted individual 2020 UWMPs (copies of said plans are provided in Appendix D through Appendix H). Further, each of these agencies documented coordination with the City for preparation of said UWMP's and included the City's projected water demands into their individual UWMPs.[6] [7] [8] [9] [10]

Law

CWC Section 10910:

> *(c) (1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code [CEQA], shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).*
>
> *(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).*
>
> *(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.*
>
> *(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.*

1.5 STATEWIDE AND LOCAL WATER CONSERVATION EFFORTS

City of Ontario Water Shortage Contingency Planning

To prepare for water shortages, the City adopted Ordinance No. 3027 on September 1, 2015, in response to the Emergency Conservation Regulations mandated by the State Water Resources Control Board. Under this ordinance, the Water Conservation Plan was updated with more stringent prohibitions and penalties. Ordinance 3027 updated the City's Water Conservation Plan that is codified in Chapter 8A, Title 6 of the City's Municipal Code ("Water Conservation Plan").[11]

The City Council adopted its 2020 Water Shortage Contingency Plan in June 2021, which describes the methods to achieve and the implications of reducing water supplies to at least 50 percent.[12] The City and OMUC implement various programs to reduce customer water consumption, including stringent use

11 City of Ontario Municipal Code, Vol. I, Title 6, Ch. 8A – Water Conservation Plan.

12 2020 OMUC UWMP, Ch. 8, June 2021.

restrictions, actions and penalties, as well as public outreach, education, and communication programs. Currently, the City is in the voluntary stage of the Water Conservation Plan, and therefore voluntary water use restrictions are in-effect.

1.6 METHOD OF ANALYSIS

This Assessment follows the requirements set forth in CEQA Section 15155 for Water Supply Analysis. This Assessment also follows the Department of Water Resources (DWR) Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001.[13] Section 1 of this Assessment describes the land use designation of the Project site, the Project's relation to the water supplier's most recent UWMP. Section 2 provides the water demand analysis of the Project; Section 3 reviews the projected water supplies for the Project; Section 4 contains the required discussion of the water supplier's groundwater supplies; and Section 5 concludes the Assessment by providing overall findings for the Project's water demand.

13 California Department of Water Resources, Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001 to assist water suppliers, cities, and counties in integrating water and land use planning. October 8, 2003. (Available at https://water.ca.gov/LegacyFiles/pubs/use/sb_610_sb_221_guidebook/guideboo k.pdf.)

2. WATER DEMAND ANALYSIS

The purpose of this section is to evaluate whether the Project was considered in the water supplier's planning for water demand. This section will: 1) identify the various water use sectors, 2) identify water demand by those sectors for the next twenty years, and 3) compare the calculated water demand of the Project to the water demand assumed in the most recent UWMP for the same Project site.

LAW

CWC Section 10910:

(c)(2)(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

2.1 CITY OF ONTARIO'S CURRENT AND FUTURE WATER DEMAND

OMUC serves at least 36,514 customer connections as part of its potable and non-potable water distribution systems.[14] As of 2020, there were 35,906 water meters throughout the City.[15] Total potable and recycled water demands within the OMUC service area averaged 40,831 acre feet per year (AFY) over the last ten years.[16] Despite growth within the City between 2010 and 2020, potable demands have steadily decreased in the last 10 years primarily due to increasing recycled water use and conservation efforts.

Current and projected potable and recycled water demands by customer class are presented in **Table 2-1**. The City's total demand in 2020 was 39,921 AFY, consisting of 32,109 AFY of potable water and 7,812 AFY of recycled water.[17] The projected 2045 potable water demand is 57,609 AFY and recycle water demand (including agricultural demand) is 16,059 AFY, for a total of 73,668 AFY.

Source: 2020 OMUC UWMP, Appendix E - 2020 WMP, Table 2-2 : Future Study Area Land Uses.

Note: The future land uses are generally based upon the City's latest general plan document entitled The Ontario Plan (2010); Revisions have been incorporated by the City's planning department, for specific developments that have been developed or planned that may differ from the 2010 document.

2.2 Project Site Land Use Assumed in the UWMP

The primary source of water for the Project would be existing water supplies used by the City to provide service to its customers. The 2020 UWMP projected water demands are based on future land uses as specified in the City's latest 2020 Water Master Plan. The Ontario Plan (City's General Plan) designates the Project site as Airport use.[18] Projected water demand for the Airport, including the Project site, is included in the UWMP 2020 projections under the "Industrial" land use designation. Using the City's current unit water demand factors, the estimated total water demand for the 97-acre Project site that was accounted for in the 2020 UWMP is 249 acre-feet per year (AFY), as shown in **Table 2-4**.

TABLE 2-4
WATER DEMAND OF THE PROJECT SITE LAND USE ASSUMED IN THE UWMP

	Land Use	Units	Domestic Water Unit Demand[a]	Total Domestic Water Usage (GPD)	Total Domestic Water Usage (AFY)
UWMP Assumption Based on Project Acreage	Industrial	97 acres	2,290 (GPD/acre)	222,130	249

Sources: City of Ontario, 2020 UWMP, June 2021, Appendix E - 2020 WMP.
Notes:
[a] Water unit factor is for "Industrial" land use designation in the 2020 WMP Demand; Table 4.8 in Appendix E of UWMP (2020 UWMP); Industrial (w/o Recycled Water) = 110 gpd/job or 2,290 gpd/acre

2.3 Proposed Project Water Demand

The Project would connect to the City's water main for domestic water use. The Project consists of an approximately 97 acres located in the southern portion of the Airport. The Project would replace existing, underutilized airport related buildings with an air cargo center. The Project would include demolition of the existing buildings, site improvements, and the development of a new air cargo center in two phases. Buildout of the Project would include a 857,000 SF Cargo Sorting Building (approximately 9 acres), which would include a sorting facility (warehouse) and office spaces; a 210,000 square-foot truckyard; a 15,300 square foot surface lot; a 271,000-square-foot parking garage; and 2,900,000 square feet (approximately 60 acres) of aircraft apron area, including a Ground Support Equipment (GSE) Maintenance Building and Aviation Line Maintenance Garage at approximately 27,000 square feet each. Gallons per day (GPD) per job from the 2020 WMP for an Industrial land use was used to calculate the Project's specific water demand based on the concentration of employees in the proposed Cargo Sorting Building, which accounts for approximately 9 acres of the 97-acre Project site. Based on the total square footage of the proposed buildings compared to the total Project site acreage, the water demand of the Project was based on the number of full time employees estimated on site. (See **Appendix O** for detailed calculation of full time employee (FTE) count for the water demand calculation). Based on the Project site land use designation of Airport included in the 2020 UWMP as Industrial, the water demand for the Project was estimated below in **Table 2-5**.

18 City of Ontario, The Ontario Plan, "Land Use Element", accessed May 2022, https://www.ontarioplan.org/policy-plan/lu-land-use-element/.

TABLE 2-5 WATER DEMAND ESTIMATE FOR THE PROJECT SITE BASED ON LAND USE IN 2020 UWMP					
	Land Use	Units	Domestic Water Unit Demand[a]	Total Domestic Water Usage (GPD)	Total Domestic Water Usage (AFY)
Project	Industrial	1,128 FTE Employees[b]	110 (GPD/Job)GPD	124,080	119
UWMP Assumption Based on Project Acreage[c]	Industrial	97 acres	2,290 (GPD/acre)	222,130	249

Sources: City of Ontario, 2020 UWMP, June 2021, Appendix E – 2020 WMP.

Notes:

[a] Water unit factor is for "Industrial" land use designation in the 2020 WMP Demand; Table 4.8 in Appendix E of UWMP (2020 UWMP); Industrial (w/o Recycled Water) = 110 gpd/job or 2,290 gpd/acre

[b] Based on 8 hour shift per employee (see Appendix O, SACC Employment by Shift)

[c] From Table 2-4, above.

Conclusion

This section evaluates whether the Project was included in the projection of future water demands for the City, as described in the 2020 OMUC UWMP. As per Section 10910 (c) (2) of the California Water Code:

> *"if the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g)."*

Based on the projections within the 2020 UWMP, the estimated water demand for the Project site, an Industrial use at 97 acres, would be 249 AFY.[19] As shown in **Table 2-5**, the estimated total domestic water demand for the Project is 124,080 gal/day (119 AFY), 130 AFY less than projected in the UWMP for the 97-acre site.

The estimated total water demand for the Project is approximately 0.48 percent of the water demand for the Industrial land use designation. Therefore, the projected water demand for the Project site in the 2020 UWMP is sufficient to account for the water needed for the Project.

19 2020 OMUC UWMP, Appendix E, Table 4.8, "Industrial" Land Use. (Based on 2,290 gpd/acre * 97 acres).

3. WATER SUPPLY ANALYSIS

This section identifies the sources of potable water utilized and available to the water supplier of the Project. The basic requirement is that a WSA must "include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the water system's existing and planned future uses, including agricultural and manufacturing uses."[20]

The purpose of this section is to evaluate the water supplies that could be utilized by the Project during normal, single-dry, and multiple-dry water years during a 20-year projection. OMUC is the water supplier to the City and the Project. OMUC has the following sources of water supply: City wells in the Chino Groundwater Basin; treated groundwater from the CDA; recycled water from IEUA; purchased water from SAWCo; and imported wholesale water from the WFA.

LAW

CWC Section 10910(d)(1):

> *The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.*
>
> *(2) An identification of existing water supply entitlements, water rights, or water service contracts held by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall be demonstrated by providing information related to all of the following:*
>
> *(A) Written contracts or other proof of entitlement to an identified water supply.*
>
> *(B) Copies of a capital outlay program for financing the delivery of a water supply that has been adopted by the public water system(C) Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.*
>
> *(D) Any necessary regulatory approvals that are required in order to be able to convey or deliver the water supply.*

3.1 DOCUMENTING WHOLESALE WATER SUPPLIES

Many retail water suppliers in California, including OMUC, receive supplies from one or more water wholesalers. SB 610 requires the WSA to document wholesale supplies received by: 1) describing the

20 California Water Code, Division 6, Part 2.10, Section 10910 (c) (3).

quantities of water received from each wholesaler in prior years; 2) identifying existing entitlements, water rights, and/or water service contracts held by the City for the wholesale supply; 3) provide proof of entitlements, water rights, service contracts, relevant capital outlay programs, and construction permits for necessary infrastructure to deliver wholesale supplies, if any; and 4) regulatory approvals required to convey or deliver the wholesale supply.

Wholesale Supplies Received

OMUC obtains treated imported water from the WFA, which is also a wholesale water supplier to the cities of Chino, Chino Hills, Ontario, Upland, and the Monte Vista Water District. WFA purchases untreated imported water from MWD through IEUA. WFA and IEUA are both wholesale water suppliers and IEUA is a member agency of MWD. MWD is a wholesaler and contractor for State Water Project water imported from northern California. State Water Project water is available as stipulated by DWR in response to the hydrology and environmental regulations that can change available supply.[21] Therefore, imported water supplies to southern California can be highly variable; in January 2014 for example, the allocation of State Water Project water to all contractors was reduced to 0 percent due to persistent drought conditions. Nonetheless, MWD has projected in its 2020 UWMP 100 percent water supply reliability over the next 20 years (2025-2045) during average, single-dry, and multiple-dry years.[22]

The amount of imported water purchased by IEUA from MWD is limited by a purchase order agreement that allows IEUA to purchase up to 93,283 acre-feet per year (AFY) at its lowest rate (Tier I) through Dec. 31, 2024.[23] The purchase order agreement includes an annual minimum purchase commitment of 39,835 AFY, which is slightly less than the minimum operational need of IEUA's four water treatment plants (40,000 AFY).[24] Resolution 2014-12-1 also establishes how much water WFA, Cucamonga Valley Water District, and Fontana Water Company may purchase from IEUA, up to 69,572 AFY.[25]

The WFA was formed in 1980 as a Joint Powers Authority by the cities of Chino, Chino Hills, Ontario, Upland, and the Monte Vista Water District in order to construct and operate water treatment facilities for providing supplemental potable water to the member agencies. In 1985, the City established an agreement to purchase capacity in the WFA water treatment plant; a copy of which is located in Appendix J. Then, in 1988, the WFA finished construction of the Agua de Lejos Water Treatment Plant (WTP) in Upland to treat the imported water from IEUA and MWD to meet drinking water standards.

Currently, the Agua de Lejos WTP has the capacity to treat and disinfect 81 million gallons per day (mgd). Recorded flows through the Agua de Lejos WTP have ranged from 40 to 50 mgd during the peak summer months and can be as low as 9-12 mgd during winter months (http://www.wfajpa.org/#Facilities). As documented in WFA Ordinance No. 99-07-02 (located in Appendix K), the City owns 31.4 percent of the plant capacity of the Agua de Lejos WTP. As of 2020, that proportion is equivalent to approximately 25 mgd (28,004 AFY).[26] OMUC can purchase up to 9,915 AFY (8.9 mgd) of imported supply through WFA at Tier 1 rates. Beyond that amount, OMUC could continue to purchase at Tier 2 rates. As of FY 19/20, OMUC purchased 6,513 AF (5.8 mgd) of wholesale water from the WFA.[27] The actual and projected wholesale water supplies that are projected to be available to WFA through 2045 are shown in **Table 3-1**.

Note: WFA = Water Facilities Authority; AFY = acre feet per year

Dry Year Yield Storage Program

The City also participates in MWD's Dry-Year Yield Program (DYYP). The DYYP is a cooperative Conjunctive Use Program Agreement between MWD, IEUA, Chino Basin Watermaster, Three Valleys Municipal Water District, and the Chino Basin groundwater producers.[28] Under the DYY Program, MWD can store up to 100,000 AFY of water in the Chino Groundwater Basin during wet years when surplus water is available, and to reduce imported water deliveries up to 33,000 AFY in dry, drought, or emergency periods, but not to exceed the amount of water in the MWD storage account.[29]

The City executed an agreement with IEUA to participate in the DYY program in 2003. The DYY Agreement was amended in September 2014 to clarify storage measurement and extraction from the MWD storage account, define baseline conditions in calculations of performance targets, define procedures for variances in performance targets, revise administrative milestones, and make miscellaneous updates. The 2014 DYY amendments also provided for a minimum imported water delivery of 40,000 AFY during

26 City of Ontario, 2020 WMP, pf 3-2, June 2020.

27 OMUC 2020 UWMP, pg. 6-37, June 2021.

28 Amendment No. 8 to Groundwater Storage Program Funding Agreement No. 49960 By and Among The Metropolitan Water District of Southern California and Inland Empire Utilities Agency and Chino Basin Watermaster. September 17, 2014. (Appendix J).

29 2020 OMUC UWMP, pg. 6-18, June 2021.

"call" years, establishing minimum needs for direct deliveries from MWD. As of June 30, 2020, the storage balance in the DYY account is 45,961 AF.[30]

Participation in the DYY program obligates OMUC to reduce its use of imported water from WFA by a fixed amount, known as the "shift obligation" when MWD makes a "call" for their water stored in the Chino Basin. OMUC's shift obligation is 8,076 AFY, which is the amount OMUC purchases from WFA during a baseline year.[31] OMUC purchases an additional 2,000 AFY from WFA that is then sold to neighboring water supplier Jurupa Community Services District (JCSD) who does not have an imported water connection. In 2014, JCSD entered into an agreement with the City to participate in the DYY program (a copy of which is located in Appendix L). During years when MWD makes a "call" for the water in their storage account, OMUC will decrease its purchase of WFA imported water by a combined total of 10,076 AF (8,076 AF plus 2,000 AF) compared to the previous year. To meet its obligation in the DYY program during a "call" year, JCSD will deliver 2,000 AF to OMUC from the Chino Basin Desalter Authority (CDA).[32]

DYY funds from DWR local assistance grants were used for the construction of three OMUC groundwater wells (Wells 45, 46, and 47) and an ion-exchange facility located at John Galvin Park to treat water extracted from Wells 44 and 52. When MWD makes a "call" for its stored water, OMUC can operate these facilities to meet its shift obligation. MWD will then pay for the cost of operations and OMUC would pay MWD (through IEUA) the full-service water rate. OMUC can use the DYY facilities to meet its normal water demands during other periods, but OMUC is responsible for the well operation and maintenance costs.[33]

The additional groundwater capacity provided by this program allows OMUC to increase the percentage supply used to meet peak demands and allow OMUC to be less reliant upon imported water supplies.[34]

3.2 Documenting Water Supplies

The OMUC provides water service to residents, businesses, and other users in the City, including the Project site. According to the 2020 UWMP, OMUC provided water to a population of 178,409 residents.[35] The City's main source of water supply is groundwater pumped from the Chino Groundwater Basin. As of the 2020 UWMP, approximately 46 percent of OMUC's water supply came from groundwater, 34 percent from imported water, and 20 percent of supply was recycled water.[36]

30 City of Ontario, 2020 UWMP, pg. 6-18, prepared by OMUC, June 2021.

36 City of Ontario, 2020 UWMP, pg. 6-37, prepared by OMUC, June 2021.

Other sources include treated groundwater produced by the Chino Basin Desalter Authority (CDA), imported groundwater from the Metropolitan Water District (MWD) of Southern California, groundwater and/or surface water purchased from San Antonio Water Company (SAWCo), and recycled water purchased from Inland Empire Utilities Agency (IEUA).

Actual water supplies provided to the City for the year 2020 are summarized in **Table 3-2** and **Table 3-3** illustrates projected water supplies available to OMUC.

TABLE 3-2
WATER SUPPLY SOURCES FOR THE CITY OF ONTARIO IN 2020

Water Supplier	Water Source	Amount (AFY)
City of Ontario (Chino Basin)	Groundwater	18,395
Chino Basin Desalter Authority	Purchased or Imported	6,636
Water Facilities Authority	Purchased or Imported	6,513
San Antonio Water Company	Purchased or Imported	565
Inland Empire Utilities Agency	Recycled Water	7,812
Total		**39,921**

Source: City of Ontario, 2020 UWMP, Table 6-8 and 6-9, June 2021.

OMUC anticipates increasing its total water supply by pursuing: 1) full utilization of OMUC's groundwater rights in the Chino Basin allowed under the Chino Basin Groundwater Adjudication Judgment (including increased groundwater recharge with stormwater and recycled water described in Section 4; 2) expanding use of recycled water; and 3) expanding use of desalter water.[37]

Water Supply Capacity

The capacity of each source of supply available to the OMUC is provided in the 2020 Ontario Water Master Plan (see **Appendix B**). The capacity of the supply system refers to the maximum production rate based on the pumps and infrastructure. For example, the capacity of groundwater wells refers to a pumping rate based on running the pumps at full utilization, 24 hours a day, 7 days a week. Although this maximum rate of pumping is assumed in terms of comparing capacities, pumps are rarely used at more than two-thirds capacity. Knowing the system capacity is important to ensure OMUC can meet all demands imposed upon the system, specifically meeting "average day demand" and "maximum day demand." Demand can be met with multiple supply sources, storage, or a combination of both. OMUC's reservoirs are not discussed in this Assessment, however, they are used to regulate hourly fluctuations in demand, provide fire flow, and supplement supply during an extended outage of a source.[38]

According to the 2020 Water Master Plan, OMUC is required to meet the following water supply criterion from the California Code of Regulations Related to Drinking Water: "a minimum source of supply equal of one maximum day demand of the service area."[39] Further, OMUC has set a design criterion in its 2020 Water Master Plan that "requires a source of supply equal to one average day demand (19,280 gpm) from local sources."[40] As the land uses and population changes in OMUC service area, so does the average and maximum day demands. The maximum capacities of existing sources of supply available to OMUC are provided in **Table 3-4**.

TABLE 3-4
EXISTING SOURCE OF SUPPLY

	Capacity		
Source	**GPM**	**MGD**	**AFY**
Existing Wells	38,604	55.6	62,269
WFA	10,700	15.4	17,259
CDA I & II	5,290	7.6	8,533
Total	**54,594**	**78.6**	**88,061**

Source: City of Ontario, 2020 Water Master Plan, Table 10-2.

As described in the Water Master Plan, the total existing supply sources is equivalent to 88,061 gpm which exceeds the criteria of one average day demand (ADD) of 19,280 gpm. The City's local water source includes direct access to groundwater from the Chino Basin, which is managed by the Chino Basin

37 City of Ontario, 2020 UWMP, prepared by OMUC, June 2021.

38 City of Ontario, 2020 WMP, pg. 7-3, June 2021.

39 City of Ontario, 2020 WMP, pg. 10-1, June 2021.

40 City of Ontario, 2020 WMP, pg. 10-1, June 2021.

Watermaster. The City's existing seventeen (17) active wells have a capacity of 38,604 gpm, which is about double the existing ADD.

The maximum capacities of the 'ultimate' sources of supply available to OMUC according to the City's 2020 Water Master Plan, are provided in **Table 3-5**.

TABLE 3-5
ULTIMATE SUPPLY CAPACITIES

	Capacity		
Source	**AFY**	**MGD**	**GPM**
Existing Wells	57,310	51.2	35,530
Future Wells[a]	48,068	42.9	29,800
WFA	17,259	15.4	10,700
CDA from Chino Desalter I & II	8,533	7.6	5,290
Total	**131,170**	**117.1**	**81,320**

Source: City of Ontario, 2020 Water Master Plan, Table 12-2.
[a] *Well 37 will be retrofitted to pump to Zone 1010.*

Altogether, the total future source of supply is equivalent to 81,320 gpm. This is about 149% of the City's future MDD (54,778 gpm). With 65,330 gpm from existing and future groundwater sources alone, the City is capable of providing the full projected maximum daily demand (MDD).[41]

The available future imported water from the Chino Desalter Authority (CDA) and Water Facility Authority (WFA) total 15,990 gpm (29% of the future MDD).[42] If some wells are out of service, the City would need 38,788 gpm (54,778 gpm – 15,990 gpm) from groundwater sources to supply the remaining MDD. This is about 59% of the future system well capacity.

3.3 Description of All Water Supply Projects

3.3.1 City Well Production

OMUC currently owns 17 active groundwater wells in the Chino Basin.[43] Groundwater from the Chino Basin is used by the City either directly by pumping into its distribution system or by treating the groundwater and then pumping the treated groundwater into the City of Ontario's distribution system. The Chino Basin is one of the largest groundwater basins in southern California, with an estimated 5 million AF in storage and another one million in additional storage capacity.[44] OMUC's existing well

44 Wildermuth Environmental, Inc. 2020 Safe Yield Recalculation Final Report prepared for the Chino Basin Watermaster. May 15, 2020.

capacity is approximately 62,269 AFY as shown in **Table 3-4**. The amount of groundwater pumped by the City from the Chino Basin since 2016 is shown in **Table 3-6**.

TABLE 3-6
HISTORIC GROUNDWATER PRODUCTION

Year	Groundwater Produced (AFY)
2015-2016	22,751
2016-2017	24,672
2017-2018	26,109
2018-2019	19,604
2019-2020	18,395
Average	***22,306***

Source: 2020 OMUC UWMP, Table 6-1, June 2021.

As of 2020, approximately 46 percent of OMUC water supply came from groundwater pumped by its own wells in the Chino Basin.[45] OMUC strives to maximize local water supplies and minimize the need for imported water from other regions. Thorough description of the City's groundwater rights pursuant to SB 610 guidance is provided in **Section 4, Groundwater Analysis**.

3.3.2 Chino Basin Desalter Authority (CDA)

OMUC is a member of the CDA, a joint exercise of powers agency created on September 25, 2001, along with JCSD, Santa Ana River Water Company, IEUA and the cities of Chino, Chino Hills, and Norco. Western Municipal Water District joined CDA on April 2, 2009. The goals of the CDA are:

- Achieve hydraulic control of the Chino Basin to prevent contaminated Chino Basin groundwater from entering Santa Ana River;
- Remove contamination (primarily nitrates, as well as TCE, PCE, and TCP) from groundwater in the southern portion of the Chino Basin; and
- Deliver the treated water to member agencies to offset the need for imported water.

CDA provides high-quality drinking water to CDA members through "take or pay" contracts. CDA operates 30 wells and two desalters (salt removers) that treated approximately 35,003 AF of Chino Basin groundwater in 2020.[46] In the future, "CDA will pump up to 40,000 AFY of contaminated groundwater from the Chino Basin for water quality management purposes, groundwater cleanup, and hydraulic control required by the Regional Water Quality Control Board. CDA will provide up to 35,200 AFY of treated water to its member agencies."[47]

45 City of Ontario, 2020 UWMP, prepared by OMUC, June 2021.

46 2020 CDA UWMP, pg. 6-27, June 2021.

47 2020 CDA UWMP, pg. 6-27, June 2021.

The Chino I Desalter, located at 6905 Kimball Avenue in Chino, was completed in 2000 and expanded in August 2005 to its current rated capacity of 14.2 mgd.[48] However, the Chino I Desalter cannot provide this rated capacity due to the high total dissolved solids (TDS) in the raw groundwater supply. The Chino II Desalter was completed in 2006 and is located at 11202 Harrel Street in the City of Jurupa Valley. The current rated capacity of Chino II Desalter is 33 mgd.[49]

Although Chino Desalter I capacity will not be increased, additional raw water capacity is provided by five new CDA wells in the Chino Creek Well Field. All five wells have been drilled and equipped.

According to the 2020 UWMP, in FY 19/20 OMUC purchased approximately 6,636 AF from CDA as shown in **Table 3-2**. As shown in **Table 3-3**, the water supply from CDA to OMUC is projected to stabilize at 8,533 AFY by 2025, which would be roughly 16 percent of the total water supply portfolio for OMUC in 2025.

3.3.3 Inland Empire Utilities Agency (IEUA)

OMUC purchases recycled water supplies from IEUA, which treats the City's wastewater at its four regional wastewater reclamation plants. IEUA provides wastewater treatment services to seven Contracting Agencies, including the City. OMUC has been using recycled water produced by IEUA since 1972. Currently, recycled water is used in the City for agricultural irrigation, landscape irrigation, golf course irrigation, and industrial purposes.

"Pursuant to the Chino Basin Regional Sewage Service Contract, each Contracting Agency has the right of first purchase of their Base Entitlement. Base Entitlement is defined as the total quantity of sewage delivered into the Regional Sewerage System by the Contracting Agency less normal processing losses resulting from the treatment of sewage."[50] In FY 19/20, this amount was 12,645 AF.[51] In FY 19/20, 7,812 AF of recycled water was purchased by OMUC for direct use (**Table 3-2**). This represents roughly 62 percent utilization of recycled water supply available to OMUC in FY 19/20. Recorded and projected supplies of recycled water available to OMUC are listed in **Table 3-7**.

Over the next 20 years, landscape irrigation is projected to have the greatest increase in demand for recycled water, followed by industrial use within the OMUC service area. Agricultural properties are expected to convert to more urban land uses, while supplies to golf courses are expected to remain relatively stable.[52]

IEUA has prepared recycled water studies, plans, and strategy documents to bring a regional recycled water delivery system to fruition. OMUC updated their Recycled Water Master Plan in 2020 (located in **Appendix C**) to fully coordinate with IEUA's recycled water planning efforts.

3.3.4 San Antonio Water Company (SAWCo)

SAWCo leases groundwater rights to San Antonio Heights (an unincorporated area of San Bernardino County), the Cities of Upland and Ontario, Monte Vista Water District, the United States Forest Service, the San Bernardino County Flood Control District, local golf courses, rock quarries, and grove irrigators. SAWCo supplies water based on entitlement only, which is based on the number of shares held. The number of shares is finite and considered a commodity that can be divided or sold. The "entire water of the company" and the current entitlement for 2020 is equivalent to 12,570 AFY, which distributed among the 6,178 shares. The volume per share is subject to change.[53]

In the past, the City received its water from SAWCo by a stored groundwater transfer. However, in 2015, SAWCo made a connection to the WFA and is now able to deliver water to the City through that connection. SAWCo water supplies are a mix of surface water from San Antonio Creek, groundwater from the San Antonio Tunnel, and three groundwater basins: Chino Basin, Cucamonga Basin, and Six Basins.[54] The City owns 295 shares of SAWCo, which equates to a current entitlement of 600 AFY of potable water

52 2020 OMUC UWMP, pg. 6-28, June 2021.

53 2020 OMUC UWMP, pg. 6-8, June 2021.

54 2020 OMUC UWMP, pg. 6-8, June 2021.

to OMUC. In FY 19/20, OMUC received an actual volume of 600 AF as shown above in **Table 3-2**. OMUC has forecasted that future available supplies will be 600 AFY from 2025 to 2045, as shown in **Table 3-3** above.

SAWCo water supplies are a mixture of potable and non-potable water from San Antonio Creek, the San Antonio Tunnel, and three groundwater basins: Chino Basin, Cucamonga Basin and Six Basins.[55] No new sources of supply are anticipated to be developed by SAWCo over the planning horizon. Actual supply available to SAWCo in 2020 totaled 2,584 AF of potable supply and 13,762 AF of non-potable supply. In their 2020 UWMP, SAWCo estimates for 2025 and 2030 that total reasonably available supplies will be 15,260 AFY.[56]

In terms of future reliability, SAWCo has stated the following in its 2020 UWMP (p. 6-4): "SAWCo expects to meet demands under all water year scenarios with existing supply sources." In addition, SAWCo has future transfer and exchange projects planned to mutually benefit certain shareholders during an emergency, including OMUC. SAWCo is currently constructing several projects to increase storage and capture all raw water released through the Frankish Tunnel. Both projects are anticipated to be completed in early 2021.[57]

3.4 Documenting Normal Year Water Supply and Demand

It is required that every urban water supplier assess the reliability to provide water service to its customers under normal, dry, and multiple dry water years. The City depends on a combination of imported and local supplies to meet its water demands and has taken numerous steps to ensure that it has adequate supplies. Water supplies available to the City are projected to meet full-service demands. OMUC has assumed in its 2020 UWMP that customer water demand and available water supply are equal during "normal" precipitation years. The normal year water supplies available to OMUC, as well as the normal year water demand projections are compared in **Table 3-8**, which are based on the City's 2020 Water Use Target of 196 gallons per capita per day (GPCD) for potable water demands.[58] The UWMP states that the City will be able to meet demand with projected supplies between 2020 and 2045 during normal years, single dry years, and multiple dry years as shown by **Table 3-8**.[59]

55 2020 OMUC UWMP, pg. 6-9, June 2021.

3.5 **DOCUMENTING** DRY YEAR WATER SUPPLY AND DEMAND

The following assumptions are made in OMUC's 2020 UWMP to estimate future water supplies and demands during a single dry year:

- The ratio of total water supplies (including potable and recycled water supplies) available to the City during a historical normal year in FY 19/20 (39,921 AF) and during a historical single dry year in FY 17/18 (43,346 AF) were used to estimate the City's projected water demands during single dry years (p. 7-9).
- Water losses have been included in the potable water demands as 7 percent of the annual demand.

OMUC has determined that the water demands during single dry years over the next 25 years will be met, as shown in **Table 3-9**.

TABLE 3-9 DRY YEAR SUPPLY AND DEMAND (AFY)					
	2025	2030	2035	2040	2045
Supply Totals	57,058	63,534	68,847	79,989	79,989
Demand Totals	57,058	63,534	68,847	79,989	79,989
Difference	0	0	0	0	0

3.6 DOCUMENTING MULTIPLE YEAR WATER SUPPLY AND DEMAND

OMUC's projections over a five-year drought period are illustrated below in **Table 3-10**, which show the City can meet water demands during future five consecutive year drought periods.

TABLE 3-10 MULTIPLE DRY YEAR SUPPLY AND DEMAND (AFY)						
		2025	2030	2035	2040	2045
First Year	Supply Totals	56,080	62,445	67,667	78,618	78,618
	Demand Totals	56,080	62,445	67,667	78,618	78,618

3.7 COMPARISON OF AVAILABLE WATER SUPPLY AND DEMAND

CWC section 10910 (c)(3) states:

> *If the projected water demand associated with the proposed project was not accounted for in the most recently adopted UWMP…the water assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.*

As described in **Section 2**, the annual total water demand for the Project is estimated at 119 AFY and the total water demand estimated by the previously planned land use of the same area, 97 acres, would be 249 AFY. This would result in a net decrease of 130 AFY.

Future water supplies available to the OMUC are projected to meet the water demands for the service area (see **Table 3-3**). Further, the Project would represent 0.21 percent of the citywide ultimate 2045 water demand/water supply as estimated by the UWMP (estimated at 57,609 AFY). In 2020, OMUC purchased about 6,513 AF from the WFA plant (Agua de Lejos WTP), which is well within their conveyance capacity of 15.4 mgd and within their rights of approximately 25 mgd.[60] As such, there would be ample

60 City of Ontario, 2020 Urban Water Management Plan, prepared by OMUC, June 2021.

water availability for the Project and meet the needs of the Project (119 AFY) based on the estimated total water demand for the 97-acre Project site that was accounted for in the 2020 UWMP (249 AFY).

Tables 3-7 through **3-9** show that OMUC projects water supplies during single-dry and multiple-dry years in volumes sufficient enough to meet the demand of the service area over the next 20 years. OMUC can also bank water and pump in excess of their rights in the Chino Basin with payment of a replenishment fee. **Section 4** will describe the supply available to OMUC through rights held to Chino Basin groundwater that are greater than the amount currently extracted.

In conclusion, based on the information provided in the 2020 UWMP and updated information provided by OMUC for this Assessment, the City has sufficient water supplies to meet the demand of the Project by purchasing additional water from WFA, and by using existing groundwater supplies and pumping capacities that are more than adequate to meet the water demands of the Project during normal, single-dry, and multiple-dry water years including future agricultural and industrial / manufacturing uses. With the implementation of water conservation efforts, OMUC will further ensure its ability to provide sufficient supply for the Project. **Section 4** will discuss the City's water rights in light of this water supply and capacity analysis.

4. GROUNDWATER ANALYSIS

SB 610 requires specific groundwater information to be included in the WSA if groundwater will be a source of water for the Project. A description of any groundwater basin or basins from which the Project will be supplied, in addition to a detailed description and analysis of the amount and location of groundwater pumped by the public water system for the past five years, should be provided.

LAW

CWC Section 10910 (f):

If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as over drafted or has projected that the basin will become over drafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project. A water supply assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet

the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

4.1 Review of Urban Water Management Plan (CWC Section 101910(f)(1))

The City's 2020 UWMP, prepared by AKM on behalf of the City (OMUC), was adopted by City Council Resolution 2021-036 and 2021-037 on June 1, 2021 (located in Appendix A). The UWMP includes information relevant to the identified water supply for the Project and is incorporated herein. Relevant information includes: 1) current and projected water demands (Water Use Characterization) through year 2045; 2) a description of the Chino Groundwater Basin (Water Supply Characterization); 3) the reliability of the water supply, projected supply and demand comparisons, and water shortage plans (Water Service Reliability and Drought Risk Assessment and Water Shortage Contingency Plan); and 4) water demand management efforts (Demand Management Measures). The ultimate water demand projections of the 2020 UWMP are based on the findings of the City's 2020 Water Master Plan and 2020 Recycled Water Master Plan.

4.2 Groundwater Basin Descriptions (CWC Section 101910(f)(2))

The Chino Groundwater Basin is the direct source of groundwater for OMUC. Although water supplied to OMUC from SAWCo may include a combination of groundwater from other basins (i.e., San Antonio Tunnel, Cucamonga Basin, and Six Basins), the amount is minimal, and the basins are described in the 2020 SAWCo UWMP (located in Appendix H).

Chino Groundwater Basin Description

The City obtains its groundwater from the Chino Groundwater Basin. The Chino Basin is located within the Upper Santa Ana Valley, which is located in San Bernardino County. The surface area of the Chino Basin is approximately 154,000 acres (or 240 square miles).[61] The San Antonio Creek and Cucamonga Creek drain the Chino Basin area southward and flow into the Santa Ana River. The State Department of Water Resources (DWR) identifies the Chino Basin as Basin No. 8-002.01, which is a sub-basin of the Upper Santa Ana Valley (Bulletin 118).[62] It is estimated the Chino Basin has approximately 5 million AF of water in storage and an estimated 1 million AF of additional unused storage capacity.[63] The Chino Basin is divided into five management zones, based on similar hydrologic conditions. The City is located approximately in the center of the Chino Basin.

61 City of Ontario, 2020 Urban Water Management Plan, prepared by OMUC, June 2021.

62 DWR collects, summarizes, and evaluates groundwater data in the "Bulletin 118" series, which present the results of basin evaluations and defines the boundaries of California's 515 alluvial groundwater basins. An update was provided in 2016. In Bulletin 118, DWR identifies each basin and sub-basin with a number code.

63 The 2020 Safe Yield Recalculation Final Report (May 15, 2020) indicates the estimated total volume of water in storage was 12.6 million AF in July 2018 (WEI 2020, p. 6-15).

DWR collects, summarizes, and evaluates groundwater data in the "Bulletin 118" series, which present the results of basin evaluations and defines the boundaries of California's 515 alluvial groundwater basins. An update was provided in 2020. The state Department of Water Resources (DWR) identifies the Chino Basin as Basin No. 8-002.01, which is a sub-basin of the Upper Santa Ana Valley (Bulletin 118).[64] DWR Bulletin 118 (updated 03/05/18) describes the Chino Basin as follows:

> *The Chino Basin is bound on the northwest by the San Jose fault, on the north by the Cucamonga fault and impermeable rocks of the San Gabriel Mountains, and on the east by the Rialto-Colton fault. The basin is bound on the southeast by the Jurupa Mountains, Pedley Hills, La Sierra Hills, and the approximate location of the Santa Ana River. The Chino fault and impermeable rocks of the Chino Hills and Puente Hills bound the southwest side of the basin. In some areas, the basin boundary coincides with the Chino Basin (1978) groundwater adjudication boundary.*

The Chino Basin is an adjudicated basin and has been extensively studied by the court-appointed Chino Basin Watermaster (CBWM), with reports available at www.cbwm.org. The following is an excerpt that describes the Chino Basin geology from the Chino Basin Watermaster's management plan called the "Optimum Basin Management Program" or "OBMP."[65]

> *The Chino Basin is located within the Upper Santa Ana Valley, which is located in San Bernardino County and is bounded on the east by the Rialto-Colton fault; on the southeast by the contact with impermeable rocks forming the Jurupa Mountains; on the south by impermeable rocks of the Puente Hills and by the Chino fault; on the northwest by the San Jose fault; on the north by the impermeable rocks of the San Gabriel Mountains and by the Cucamonga fault. The location of the Chino Basin is provided in Figure 3. The surface of the Chino Basin is approximately 154,000 acres (or 240 square miles). The San Antonio Creek and Cucamonga Creek drain the Chino Basin area southward and flow into the Santa Ana River. Pursuant to the DWR Bulletin 118 (for Basin Number 8-2.01), the total storage capacity of the Chino Basin is approximately 18,300,000 AF.*
>
> *The water-bearing units in the Chino Basin includes Holocene and Upper Pleistocene alluvium. This Holocene alluvium consists mainly of alluvial-fan deposits, with maximum thickness of 150 feet that are coarsest in and near the mouths of the canyons and are finer away from canyon mouths in the southern part of the Chino Basin. The Pleistocene alluvium is exposed mainly in the north part of the subbasin and supplies most of the water to well located within the Chino Basin. The Pleistocene alluvium contains interfingering finer, alluvial-fan deposits and coarser, fluvial deposits.*
>
> *The Chino Basin was formed when eroded sediments from the San Gabriel Mountains, the Chino Hills, Puente Hills, and the San Bernardino Mountains filled a structural depression. The bottom of the Basin - the effective base of the freshwater aquifer - consists of impermeable sedimentary and igneous rocks. The base of the aquifer is overlain by older alluvium of the Pleistocene period followed by younger alluvium of the Holocene period. The younger alluvium*

64 Department of Water Resources, California's Groundwater Update 2020 (Bulletin 118), accessed May 2022, https://data.cnra.ca.gov/dataset/calgw_update2020.

65 Wildermuth Environmental, Optimum Basin Management Program Phase I report prepared for Chino Basin Watermaster. August 19, 1999. (Available at http://www.cbwm.org/docs/engdocs/OBMP%20-%20Phase%20I%20(Revised%20DigDoc).pdf).

varies in thickness from over 100 feet near the mountains to a just few feet, south of Interstate 10 and generally covers most of the north half of the Basin in undisturbed areas. The younger alluvium is not saturated and thus does not yield water directly to wells. Water percolates readily in the younger alluvium and most of the large spreading basins are located in the younger alluvium. The older alluvium varies in thickness from about 200 feet thick near the southwestern end of the Basin to over 1,100 feet thick southwest of Fontana, and averages about 500 feet throughout the Basin.

Legal Right to Pump from the Chino Basin

Water rights to the Chino Basin were adjudicated by the Superior Court of the State of California for the County of San Bernardino in 1978 (a copy of the Judgment and amendments thereto are provided in Appendix M). The court's Judgment declared the safe yield of the Chino Basin at 140,000 acre-feet per year (AFY).[66] Withdrawal in excess of safe yield is termed overdraft. The Chino Basin Watermaster may determine that the operating safe yield (OSY) can be higher from year-to-year depending on factors including favorable precipitation and management efforts that maximize the beneficial use of the groundwater Basin.[67] The Chino Basin Watermaster has undertaken a safe yield redetermination. In July 2020, the court ordered that the safe yield be reduced by 3% and reset to 131,000 AFY for the period of July 1, 2020, to June 30, 2030. The court previously reset the safe yield from its initial 140,000 AFY to 135,000 AFY in 2017 for the period of 2010 to 2020.

The Chino Basin Watermaster is comprised of three stakeholder groups (or "pools"): Overlying Agricultural Pool Committee (representing dairymen, farmers, and the State of California); the Overlying Non-Agricultural Pool Committee (representing businesses and industries); and the Appropriative Pool Committee (representing local cities, public water districts and private water companies). The Chino Basin Watermaster carries out the provisions of the Judgment including monitoring of the Chino Basin and files an annual report on pumping and replenishment.

The City is a member of both the Overlying Non-Agricultural Pool and the Appropriative Pool. The Judgment allocates a portion of the safe yield to the Overlying NonAgricultural Pool and a portion of the OSY to the Appropriative Pool. Pursuant to the Judgment, the City has appropriative rights to 20.742 percent of the OSY allocated to the Appropriative Pool. The City has gained 53.338 percent of the safe yield assigned to the Overlying Non-Agricultural Pool.[68] The assigned share of the safe yield and OSY change depending on the safe yield set by the court.

66 Judgment (1978) defines Safe Yield as, "The long-term average annual quantity of groundwater (excluding replenishment or stored water but including return flow to the Basin from use of replenishment or stored water), which can be produced from the basin under cultural conditions of a particular year without causing an undesirable result."

67 Judgment (1978) defines Operating Safe Yield (OSY) as, "The annual amount of groundwater which Watermaster shall determine, pursuant to criteria specified in Exhibit "I", can be produced from Chino Basin by the Appropriative Pool parties free of replenishment obligation under the physical solution herein."

68 Chino Basin Watermaster, Fiscal Year 2020-2021, 44th Annual Report, 2021, accessed May 20221, http://www.cbwm.org/docs/annualrep/44th%20Annual%20Report.pdf.

The Judgment allocates safe yield of the Chino Basin according to the three pools as described above (Appendix M, Paragraph 13). The members of each pool are then enjoined from producing water from the Chino Basin in excess of such allocated amount "except pursuant to the provisions of the Physical Solution" (Appendix M, Paragraph 13(a)-(c)).

The Physical Solution of the Judgment is described in broad terms by Paragraphs 39 through 57 of the Judgment. Paragraph 45 provides the Chino Basin Watermaster with the authority to levy and collect assessments for the purchase of water necessary to balance the production by any party in excess of that party's allocated share of safe yield of the Chino Basin. Paragraphs 49 and 50 then describe the sources of water which are authorized to function as sources of replenishment water and methods by which water can be replenished to the Chino Basin. Exhibit H, Paragraph 7, of the Judgment describes the way in which costs for replenishment water will spread among the members of the Appropriative Pool.

The afore-cited paragraphs of the Judgment evince a clear expectation that parties, including the City/OMUC, would produce water in excess of their adjudicated production rights. The injunction in Paragraph 13 of the Judgment should thus be interpreted to mean that parties are enjoined from producing water in excess of their adjudicated rights except to the extent that they will pay a replenishment assessment.

The ability to produce water from the Chino Basin is accordingly not a matter of availability, as contemplated and sanctioned by the Judgment for the reasons discussed above, but rather a matter of cost. Water produced in excess of production rights will cost more than water produced within a party's production rights. Thus, the quantity and reliability of groundwater supplies under the Judgment for purposes of this Assessment is a matter of the cost of the water produced from the Chino Basin rather than limitations on production which may otherwise operate to reduce the sufficiency of the groundwater supply.

In addition to the water supplies described in Section 3, OMUC has rights to groundwater held in the Chino Basin as described below (from Chino Basin Watermaster's Approved 2021/2022 Assessment Package for Production year 2020/2021, dated May 2021) and in **Table 4-1**.

The City's legal right to pump water in an amount necessary to meet all of its demands has been adjudicated and will ensure the long-term reliability of the groundwater source as the safe yield of the aquifer has been determined. Water rights to the Chino Basin were adjudicated in 1978 by the Superior Court of the State of California for San Bernardino County (a copy of the Judgment and amendments thereto are provided in Appendix M). Since that time, the Chino Basin has been sustainably managed, as required by the Judgment, under the direction of the court-appointed Watermaster. The original Watermaster was the Chino Basin Municipal Water District (now IEUA). Since 1998, the Watermaster has been the Chino Basin Watermaster.

Appropriative Right

The City has appropriative rights to 20.742 percent of the OSY allocated to the Appropriative Pool. As of FY 20/21, the OSY is 40,834 AF; therefore, the City's assigned share is 8,469.8 AF.[69] To supplement the 2017 decrease in safe yield, the City currently receives an additional 1,866.8 AFY transferred from unproduced Agricultural Pool rights ("Safe Yield Reduction").

Overlying Non-Agricultural Right

The City has purchased and has rights to 53.338 percent of the safe yield assigned to the Overlying Non-Agricultural Pool, which is currently 7,350.3 AFY. As of FY 20/21, the City's assigned share is 3,921 AF.[70]

Land Use Conversions

The City gains rights to additional Chino Basin groundwater as a result of land use conversions from agricultural to non-agricultural uses. This is expected to increase from development of Ontario Ranch; the total of which is adjusted annually by the Watermaster. As of FY 20/21, the City receives 4,668.3 AFY from land use conversions.[71]

Annual Early Transfers

The Chino Basin Watermaster can approve an "Early Transfer" of water to the Appropriative Pool equal to the quantity of water not produced by the Overlying Agricultural Pool that is remaining after all land use conversions are satisfied, pursuant to the Peace Agreement.[72] The Early Transfer Water is annually allocated among the Appropriative Pool members in accordance with their pro-rate share of the initial Safe Yield. For the City, this is 20.742 percent of the "early transfer" water that the Watermaster may transfer from the Overlying Agricultural Pool.[73] The amount available for transfer changes from year to year but is projected to increase. In FY 20/21, the City received 4,272.6 AFY as its share of Early Transfer.[74]

---

69 Chino Basin Watermaster, Fiscal Year 2020-2021, 44th Annual Report, 2021, accessed May 20221, http://www.cbwm.org/docs/annualrep/44th%20Annual%20Report.pdf.

70 Chino Basin Watermaster, Approved 2021/2022 Assessment Package (Production Year 2020/2021), Nov. 18, 2021. http://www.cbwm.org/docs/financdocs/All%20Assessment%20Packages/2021-22%20Assessment%20Package.pdf.

71 City of Ontario, 2020 UWMP, Section 6.2.2, June 2021.

72 In 2007, the parties to the Chino Basin Judgement approved the "Peace Agreement" which is a set of measures proposed by Chino Basin Watermaster to supplement the OBMP Implementation Plan. Focus for the measures were placed on achieving hydraulic control (reduction of groundwater discharge from the Chino North Management Zone to the Santa Ana River). To achieve hydraulic control, re-operation (controlled overdraft) of the groundwater basin is proposed. Strategically placed wells would be constructed in the basin and the groundwater would be pumped to the Desalter to improve the long-term reliability of the basin.

73 2020 OMUC UWMP, pg. 6-10, June 2021.

74 Chino Basin Watermaster, Approved 2021/2022 Assessment Package (Production Year 2020/2021), Nov. 18, 2021. http://www.cbwm.org/docs/financdocs/All%20Assessment%20Packages/2021-22%20Assessment%20Package.pdf.

Groundwater Recharge Credits

The City is entitled to water rights due to groundwater recharge with stormwater and recycled water in the Chino Basin. The credited amount is based on the volume recharged and therefore varies annually but is projected to increase over time. In FY 19/20, no recharge credits were purchased by the City due to limitations on groundwater storage capacity.[75]

Fontana Recycled Water Rights

The City has a long-term contract to purchase up to 3,000 AFY of recharged recycled water rights from the City of Fontana (a copy of which is in Appendix N). The City of Fontana does not operate a water system. The amount purchased by OMUC each year will vary. In FY 19/20, no recharged water rights were purchased due to limitations on groundwater storage capacity.[76]

Groundwater Storage Accounts

The City has rights to store water in the Chino Basin (Appropriative and Overlying Non-Agricultural) and has been increasing its various storage accounts in recent years. The City holds water in both local storage accounts and supplemental accounts. Local storage accounts hold unpumped OSY groundwater rights and stormwater that has been recharged into the Chino Basin. Supplemental accounts hold both imported water and recycled water that has been recharged into the Chino Basin. In 2021, the City had 133,618.4 AFY in storage pursuant to Appropriative rights and 1,918 AFY in storage pursuant to Overlying Non-Agricultural rights.[77]

[a] OMUC 2020 UWMP, pg. 6-8.

4.3 Recorded Use of Groundwater (CWC Section 101910(f)(3))

The City owns 17 active groundwater wells located throughout the OMUC service area within the Chino Basin. As of FY 19/20, OMUC produced 18,395.3 AF from the basin.[78] Over the past five years, the City has produced 18,395 AFY to 26,109 AFY, with an average of 22,306 AFY from the Chino Basin, as seen in **Table 3-6**. Recorded groundwater use has generally decreased over the years. The recorded groundwater production has generally decreased from 36,842 AFY in 2000.[79]

The Project will receive water from a combination of the City's groundwater extracted from the Chino Basin, treated groundwater from the CDA, recycled water from the IEUA, and imported water from the WFA.

Projected groundwater use by OMUC will continue as noted in **Table 3-3**. The use of groundwater will continue to be dependent upon the cost of extracting, treating, and transporting the water to customers.

78 OMUC 2020 UWMP, pg. 6-3, June 2021.

79 2000-2009 from the 2012 Ontario Water Master Plan; 2010 from OMUC 2010 UWMP; and 2011-2020 from OMUC 2020 UWMP, p. 6-3.

Groundwater from the Chino Basin will be utilized by OMUC either directly by pumping into its distribution system or by treating the groundwater (Wells 44 and 52) at the John Galvin Ion Exchange Plant and then pumping the treated groundwater into the City distribution system.[80] The current and ultimate production capacity of OMUC wells is sufficient to meet current and ultimate demand as shown in **Table 3-4**.

As shown in **Table 4-1**, the amount of water that OMUC expects to withdraw from the Chino Basin is well within appropriate right pursuant to the Chino Basin Adjudication of 1978 (Appendix M). In addition to its well production, OMUC will also purchase treated Chino Basin groundwater from CDA. OMUC has 1,500 AFY capacity rights in the Chino I Desalter and 7,033 AFY capacity rights in the Chino II Desalter.[81] The City also purchases treated groundwater from the CDA. The City currently has an entitlement of 8,533 AFY from the CDA.

4.4 Sufficiency of Groundwater Basin (CWC Section 101910(f)(5))

The City's legal right to pump water in an amount necessary to meet all demands as sanctioned and protected by the Judgment as discussed above, is buttressed by several programs and projects directed at ensuring the sufficiency of groundwater supplies from the Chino Basin, particularly during dry years. An adjudicated water right has perhaps the most substantial indication of reliability of any water right that currently exists in California. An adjudicated right is based upon long-term studies whose purpose it is to protect the long-term functionality of the water source. These rights are coordinated in an established and binding manner with all the other users of the Chino Basin and are overseen by Chino Basin Watermaster, which has the authority to mandate and proscribe activities whose purpose is to protect the water source and maximize its long-term beneficial use.

All Chino Basin Watermaster processes are governed by Rules and Regulations and receive active oversight from the Court which, as noted above, retains continuing jurisdiction over the administration of the Judgment. Consequently, the sufficiency of the groundwater is not only directed by rigorous Chino Basin Watermaster management processes but validated and ensured by continuing Court oversight.

The OBMP for the Chino Basin has guided the Chino Basin Watermaster's activities since its adoption in 1998. Chino Basin Watermaster-led basin management activities to ensure the maximization of safe yield and OSY of the Chino Basin include objectives, projects, and programs identified in the Peace Agreement and the OBMP. Progress is reported in annual reports, biannual, and triennial reports. The key programs include:

1. a comprehensive monitoring program.
2. a comprehensive recharge program.

---

80 OMUC 2020 UWMP, pg. 6-33, June 2021.

81 Chino Basin Desalter Authority, 2020 UWMP, June 2021.

3. development and implementation of a water supply plan for impaired areas of the Chino Basin.
4. development and implementation of a comprehensive groundwater management plan for Management Zone 1.
5. development and implementation of a regional supplemental water program.
6. development and implementation of cooperative programs with the California Regional Water Quality Control Board – Santa Ana Region and other agencies to improve Basin management.
7. development and implementation of a salt management program.
8. development and implementation of a groundwater storage program.
9. development and implementation of storage and recovery programs.

As stated, the referenced elements of the OBMP collectively comprise of a comprehensive regimen directed to ensuring and maximizing the long-term beneficial use of water in the Chino Basin. OBMP Program Element No. 3, "Develop and Implement Water Supply Plan for the Impaired Areas of the Chino Basin," and Program Element No. 5, "Develop and Implement Regional Supplemental Water Program," address the sufficiency of groundwater from the Chino Basin. Fundamentally, the goal of Program Elements 3 and 5 is to:[82]

> *To maintain and enhance Safe Yield with a groundwater desalting program that is designed to replace declining agricultural groundwater pumping in the southern part of the basin with new pumping to meet increasing municipal water demands in the same area, to minimize groundwater outflow to the Santa River, and to increase Santa Ana River recharge into the basin.*
>
> *To improve the regional conveyance and availability of imported water and recycled waters throughout the basin.*

The achievements from the implementation of the 2000 OBMP for Element 3 and 5 are summarized below.[83]

> *Program Element 3 Develop and Implement Water Supply Plan for Impaired Areas (Groundwater Desalting): The objectives of this Program Element are to maintain and enhance the Safe Yield of the basin. The groundwater desalting program was designed to replace declining agricultural groundwater pumping in the southern part of the basin with new groundwater pumping to meet increasing municipal water demands in the same area. The new wells used in the groundwater desalting program were constructed in strategic locations to minimize groundwater outflow to the Santa Ana River and to increase the Santa Ana River recharge into the basin. In 2000, the groundwater desalting program included a 6,000 AFY treatment plant and a series of wells constructed in the southern part of the Chino Basin near the Chino Airport. Under the OBMP, as*

82 2020 Optimum Basin Management Program Update Report, prepared by Wildermuth Environmental, January 2020, accessed May 2022, https://cbwm.syncedtool.com/shares/folder/PaauzoQapiZ/?folder_id=5151637.

83 Wildermuth Environmental, 2020 Optimum Basin Management Program Update Report, January 2020. Appendix A, pg. 5 – 6.

of 2018, the desalting program has grown to two treatment plants and additional wells that in aggregate pump and treat about 30,000 AFY degraded groundwater, and the program will reach the OBMP objective of 40,000 AFY in 2019. The groundwater desalting program facilities are owned by the Chino Basin Desalter Authority (CDA).

Program Element 5: Develop and Implement Regional Supplemental Water Program (Recycled Water Reuse): The objective of this Program Element is to improve the regional conveyance and availability of imported and recycled waters throughout the basin. Since 2000, the IEUA has constructed and operated a recycled water conveyance system throughout the basin enabling it to provide recycled water to its member agencies. Recycled water deliveries grew from about 3,400 AFY in 2000 to about 34,000 AFY in 2017. The recycled water provided by the IEUA has replaced a like amount of groundwater and imported water that would have been otherwise been used for non-potable purposes. Much of the post-2000 increase in supplemental water storage in the Chino Basin is attributable to the increased availability of recycled water. Recycled water is more reliable than imported water, and thus using it in lieu of imported water has improved the sustainability of the Chino Basin and water supply reliability. Improvements in the regional conveyance and availability of imported water were not achieved.

As indicated above, the City overlies groundwater supplies in the southern part of the Chino Basin which must be pumped for purposes of meeting new demands, maintaining safe yield, and to protect water quality in the Santa Ana River. As agricultural production in the southern part of the Chino Basin has declined, it is necessary for these reasons to increase production for municipal uses. This is being achieved through the Chino I and Chino II Desalters, of which the City has a contractual right to purchase 8,533 AFY pursuant to the 2001 “Joint Exercise of Powers Agreement Creating the Chino Basin Desalter Authority” and subsequent agreements. Thus, not only was Chino Basin water production increased by the City foreseen in the OBMP, but it also sanctioned and encouraged water production for purposes of achieving OBMP objectives.

The sufficiency of the groundwater supply that is available to OMUC is assured due to the abundance of groundwater in the central and southern portion of the Chino Basin. OBMP objectives that prioritize and assure production from the southern Chino Basin, coupled with desalting and ion-exchange treatment facilities, enable the use of this abundant supply for municipal (potable) purposes. As indicated in the quoted text of the OBMP, southern basin production, where the City is partially located, is the linchpin of several critical OBMP objectives. Thus, the sufficiency of groundwater is heightened and prioritized by the necessity of continued pumping from the southern Chino Basin under the OBMP, which is administered by the Chino Basin Watermaster and ultimately enforced by continuing court jurisdiction over the Judgment.

The other referenced OBMP Program Elements are collectively directed to ensuring the sufficiency of Chino Basin groundwater supplies, particularly during dry years, and comprehensively address water quality and quantity, thus maximizing beneficial use over the long-term. Sufficiency of groundwater from the Chino Basin is further assured for the following reasons:

- IEUA is a member agency of MWD, which provides imported water from the State Water Project for direct use by parties to the Judgment in the Chino Basin and for Chino Basin recharge purposes (when supplies are available). IEUA has also reviewed the sufficiency of supplies for its service territory that includes the Chino Basin in connection with its 2020 UWMP.

- IEUA's UWMP is consistent with, and reiterative of, OBMP projects and programs (see Section 4 of IEUA 2020 UWMP in Appendix E). IEUA anticipates increased limitations for imported water for direct and recharge use while noting reductions during dry years (due to increased reliance on groundwater from the Chino Basin) and in the higher amount otherwise required in the absence of OBMP projects and programs. The UWMP also analyzes the sufficiency of water supplies for single and multiple year drought scenarios and concludes the region is expected to meet 100 percent of its dry year demand under every scenario. Key assumptions included:
  - Reliance on assurances provided by MWD in its 2020 UWMP that it could meet 100 percent of projected supplemental full-service water supply demands through 2040;
  - Implementation of MWD's Chino Basin DYY Storage Program consistent with the contractual shift obligations of the participating agencies of up to 33,000 AF in a twelve-month period; and
  - Sustain per capita water use reductions of 20 percent.

IEUA concluded in its 2020 UWMP that the projected available water supply will meet projected water demand due to diversified water supply and water conservation measures. Based on IEUA water supply projections, there are sufficient water supplies to meet normal year water demands, single dry year, and multiple dry year demands.[84]

CWC section 10631(j) provides that urban water suppliers that rely upon a wholesale agency for a source of water, such as IEUA, may rely upon water supply information provided by the wholesale agency in fulfilling UWMP informational requirements.

IEUA's independent analysis of contemporary regional water conditions in conjunction with MWD's most recent report, provide additional and reliable assurances concerning the sufficiency of imported water supplies that comprise a portion of overall Chino Basin supply sufficiency.

The City's participation in the DYY Storage Program described in **Section 3**, along with future water storage and recovery projects, will drought-proof the Chino Basin and all other appropriative pool members from imported water shortages. This program is consistent with OBMP Program Element No. 9, "Develop and Implement Storage and Recovery Program." Benefits to the Chino Basin associated with this program include the construction of facilities to enhance imported water deliveries and the production of water from the Chino Basin. Further demonstrating the sufficiency of Chino Basin groundwater is MWD's DYY program to use the Chino Basin for dry year supply purposes, thus underscoring that sufficient Chino Basin groundwater is available during dry years not only for local use by agencies, such as the City, but also in connection with MWD's regional reliability programs.

84 IEUA 2020 UWMP, pg. 7-7, June 2021.

The sufficiency of groundwater supplies available to OMUC is assured because of the OBMP programs overseen by the Chino Basin Watermaster and are conducted under the auspices of continuing Court jurisdiction that specifically direct and assure the long-term production of water pursuant to the City's legal rights to produce such water necessary to meet ultimate water demands.

Conclusion

The City's total annual groundwater production has been held relatively stable over the past 10 years at roughly 20,000 AFY.[85] Production capacity meets current demands and is projected to increase to meet ultimate demand. The current water supply utilized by the City totals approximately 39,921 AFY (FY 19/20, Table 3-2). Currently, the City's water rights in the Chino Basin as recorded by the Chino Basin Watermaster totaling approximately 36,514.9 AFY (Annual Production Rights for Non-Ag Pool plus Appropriative Pool), with an additional 96,544 AF in storage.[86] Although annual fluctuations will occur, the City's rights are projected to increase over the next 20 years due to more land use conversions and credits from recharge.

In conclusion, the water supplies available to OMUC currently meet and exceed citywide water demands. Groundwater production by OMUC is currently less than their existing rights and within their production capacity. Regardless, OMUC has the means and right to exceed their groundwater allocation in the Chino Basin when required to meet demand pursuant to the Judgment. Further, OMUC has rights to water held in storage that would supply all City demands for more than two years. In addition to groundwater, OMUC can supply water to the Project purchased from the WFA that is within their existing entitlements and capacities. Therefore, OMUC can meet the additional unplanned water demand of the Project by producing additional groundwater or purchasing imported water supplies to which it has existing rights to and available capacity to use.

86 OMUC 2020 UWMP, p. 6-12, June 2021.

5. PRIMARY ISSUE FOR ASSESSMENT

The lead agency for a proposed project shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy demands of the project, in addition to existing and planned future uses (CWC section 10911). The lead agency is expected to approve or disapprove the project based on several factors, including but not limited to the WSA.

Law

CWC Section 10910(g)(1): Subject to paragraph (2), the governing body of each public water system shall submit the assessment to the city or county not later than 90 days from the date on which the request was received. The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting.

CWC Section 10911(b): The city or county shall include the water assessment provided pursuant to Section 10910, and any information provided pursuant to subdivision 9a), in any environmental document prepared for the project pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.

(c) The city or county may include in any environmental document an evaluation of any information included in that environmental document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.

The lead agency is expected to review the WSA and decide whether additional water supply information is needed for its consideration of the Project.

5.1 FINDINGS

Whereas:

10. The City of Ontario Municipal Utilities Company (OMUC) has been identified as the water supplier for the proposed Ontario Airport South Airport Cargo Center Project (Project).
11. The estimated potable water demand for the Project would be 119 AFY.
12. The City's 2020 Water Master Plan Update and 2020 UWMP calculated the Project site's water demand as it was shown in the General Plan Land Use Plan, which is estimated as a potable water demand of 249 AFY.
13. OMUC produced 18,395 AF of groundwater in FY 19/20 (**Table 3-2**). OMUC has annual production rights in the Chino Groundwater Basin that currently total 36,515 AFY, as well as groundwater storage accounts that total 133,618 AF (**Table 4-1**). The water supply production capacity from City wells is

currently 54,594 AFY, which is projected to increase to 131,170 AFY to meet demand (**Table 3-4** and **3-5**).

14. OMUC holds shareholder entitlements to potable water from SAWCo in the amount of 600 AFY, and capacity rights to imported water from the WFA in the amount of approximately 28,000 AFY. OMUC also has capacity rights to potable water from the CDA in the amount of 8,533 AFY (Table 3-2 and 3-4). In FY 19/20, OMUC purchased 565 AF from SAWCo, 6,513 AF from WFA, and 6,636 AF from CDA (**Table 3-2**).
15. OMUC is entitled to the recycled water generated by IEUA from the City's annual share of sewer flows. In FY 19/20, the City delivered 12,650 AF to IEUA treatment plants, of which 7,812 AF was put to non-potable direct recycled water use (**Table 3-7**).
16. As of FY 19/20, citywide potable and recycled water demands were 32,109 AF and 7,812 AF, respectively (Table 2-1); ultimate potable and recycled water demands are projected to be 57,609 AFY and 16,059 AFY, respectively by 2045 (**Table 2-1**). The current production capacities are greater than needed to meet the average day demands under citywide buildout conditions. Additional wells are planned to supply the anticipated ultimate maximum day demand.
17. OMUC has forecasted excess water supplies will be available to meet citywide demand during single-dry and multiple dry water years over the next 20 years (**Table 3-8** and **Table 3-10**).
18. Based on the evidence provided herein, the total projected potable and recycled water supplies available to the OMUC during normal, single dry, and multiple dry water years over a 20-year projection will be sufficient to meet the projected water demand associated with the Project in addition to the water supplier's existing and planned future uses, including agricultural and manufacturing uses. State mandated conservation efforts will reduce demand in the future.

A Water Supply Assessment (WSA) was prepared to assess the water demand and supply conditions with implementation of the Project. As shown in **Table 2-5**, the total domestic water demand for the Project is estimated at 124,080 GPD (119 AFY).

According to the City's 2020 UWMP, the City has adequate supplies to serve 100 percent of its customers during normal, dry year, and multiple dry year demand through 2040, accounting for projected population increases and corresponding increases in water demand. Projected water demand for the Project was included in the 2020 UWMP projections based on the General Plan land use designation for "Industrial" uses. The Project would consist of 857,000 SF of warehouse and office space in the Cargo Sorting Building. The remainder of the site acreage would consist of aircraft uses and truckyard and visitor parking. The projected water demand for the Project is 0.48 percent of the water demand for the land use that was accounted for in the 2020 UWMP. Therefore, implementation of the Project would not obstruct the City's ability to meet water demands of its customers in normal, single dry, and multiple dry years.

This WSA concludes that the City will have sufficient water supplies available during normal, single dry, and multiple dry years through the year 2045 to meet all projected water demands associated with its existing and future customers, including the Project. In the unlikely event of a water shortage, implementation of the City's Water Conservation Plan and water efficiency strategies would ensure that sufficient water supplies were available to serve its customers, including the project, and existing and future users. The demands set in the 2020 UWMP for the Project area are sufficient for the Project demands and would hypothetically meet future warehouse expansion demands if the expansion does not exceed the set Project area.

Chapter 1

URBAN WATER MANAGEMENT PLAN INTRODUCTION AND OVERVIEW

INTRODUCTION

An urban water supplier is defined (pursuant to Section 10617 of the California Water Code or CWC[1]) as "*a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. An urban water supplier includes a supplier or contractor for water, regardless of the basis of right, which distributes or sells for ultimate resale to customers.*"

The City of Ontario (City) is classified as an urban water supplier because it serves more than 3,000 customers (i.e. individual metered accounts) and it supplies more than 3,000 acre-feet of water annually to its customers for municipal purposes.

In accordance with the "Urban Water Management Planning Act", which was enacted by the California Legislature in 1983, every urban water supplier (including the City) is required to prepare and adopt an Urban Water Management Plan (UWMP), periodically review its UWMP, and incorporate updated and new information into an updated UWMP at least once every five years.

The City's most recent update was its 2015 UWMP (or 2015 Plan) which was submitted to, and approved by, the California Department of Water Resources (DWR) in 2016. Urban water suppliers (including the City) are required to complete and submit their 2020 UWMPs to DWR by July 1st, 2021.

The current requirements for preparing the UWMP are included in CWC Sections 10608 through 10657. The City's 2020 UWMP (or 2020 Plan) was prepared consistent with the CWC and the recommended organization provided in DWR's Final "Urban Water Management Plan Guidebook 2020" (Final 2020 UWMP Guidebook), dated March 2021.

The UWMP provides urban water suppliers (including the City) with a planning document for long-term resource planning to ensure adequate water supplies are available to meet existing and future water supply needs. In addition, the 2020 UMWP incorporates water supply reliability determinations resulting from potential prolonged drought, regulatory revisions, and/or changing climatic conditions.

[1] References to CWC Sections in this 2020 UWMP were obtained from https://leginfo.legislature.ca.gov/

The City's 2020 Plan consists of the following Chapters:

Chapter 1 Urban Water Management Plan Introduction and Overview
Chapter 2 Plan Preparation
Chapter 3 System Description
Chapter 4 Water Use Characterization
Chapter 5 SB X7-7 Baseline, Targets, and 2020 Compliance
Chapter 6 Water Supply Characterization
Chapter 7 Water Service Reliability and Drought Risk Assessment
Chapter 8 Water Shortage Contingency Plan
Chapter 9 Demand Management Measures
Chapter 10 Plan Adoption, Submittal, and Implementation

Lay descriptions are presented at the beginning of each of these Chapters that offer a succinct, executive summary type overview.

LAY DESCRIPTION – CHAPTER 1

URBAN WATER MANAGEMENT PLAN INTRODUCTION AND OVERVIEW

Chapter 1 (Urban Water Management Plan Introduction and Overview) of the City's 2020 Plan discusses and provides the following:

- An analysis of the City's ability to provide sufficient water supplies to meet the projected water demands of its customers, including during a five consecutive year drought period.
- An overall lay description of the 2020 Plan, including California Water Code and Urban Water Management Plan Act requirements, is provided. The City is required to prepare an Urban Water Management Plan.
- The City's 2020 Plan was prepared consistent with the recommended organization provided in DWR's Final "Urban Water Management Plan Guidebook 2020", dated March 2021. A description regarding the organization of the 2020 Plan, including a summary of each Chapter, is provided. The City's Water Shortage Contingency Plan (discussed in Chapter 8) is also included in the 2020 Plan.
- The 2020 Plan incorporates DWR's water use and supply tables (standardized tables) for the reporting and submittal of UWMP data. These tables are included within the respective sections of the 2020 Plan and in Appendix A.
- The City's coordination efforts with other planning agencies are discussed, including coordination efforts with the City of Ontario's Planning Division, Inland Empire Utilities Agency, Water Facilities Authority, and the Southern California Association of Governments
- The City's eligibility to receive grants and loans administered by the State of California and/or DWR, as a result of preparing the 2020 Plan, is discussed.

- Information is provided which demonstrates the City's prior, continued, and projected reduction on imported water supplies obtained (either directly or indirectly) from the Sacramento-San Joaquin Delta (Delta). The City has reduced its reliance on imported water supplies through a reduction of GPCD water demand and increased recycled water use for Fiscal Year 2014-15 through Fiscal Year 2019-2020. In addition, the City is projected to continue reducing its reliance on imported water supplies through Fiscal Year 2044-45. Further discussion which demonstrates the City's measurable reduction in imported water supplies and improvement in regional self-reliance is provided in Appendix B.
- The checklist developed by DWR and used by the City to incorporate the specific UWMP requirements is discussed. The completed checklist is provided in Appendix C.

1.1 RECOMMENDED UWMP ORGANIZATION

The City's 2020 Urban Water Management Plan (2020 Plan) was prepared consistent with the recommended organization provided in DWR's Final "Urban Water Management Plan Guidebook 2020" (Final 2020 UWMP Guidebook), dated March 2021. The City's 2020 Plan consists of the following Chapters:

Chapter 1	Urban Water Management Plan Introduction and Overview
Chapter 2	Plan Preparation
Chapter 3	System Description
Chapter 4	Water Use Characterization
Chapter 5	SB X7-7 Baselines, Targets, and 2020 Compliance
Chapter 6	Water Supply Characterization
Chapter 7	Water Service Reliability and Drought Risk Assessment
Chapter 8	Water Shortage Contingency Plan
Chapter 9	Demand Management Measures
Chapter 10	Plan Adoption, Submittal, and Implementation

Pursuant to CWC requirements, the City's 2020 Plan incorporates DWR's water use and supply tables (standardized tables) for the reporting and submittal of UWMP data. DWR's standardized tables are provided within the body of the 2020 Plan text as well as in Appendix A. The City also submitted the UWMP data (standardized tables) electronically through DWR's Online Submittal Tool.

The City's 2020 Plan also provides supporting documents (appendices) including notification letters of the Plan update, public notice of the Plan hearing, and adoption resolution from the City's governing body. Further discussions regarding these supporting documents are provided within the individual Chapters of the City's 2020 Plan.

1.2 UWMPS IN RELATION TO OTHER EFFORTS

The City's 2020 Plan was prepared in coordination with planning agencies including the City of Ontario's Planning Division and the Southern California Association of Governments (SCAG). In addition, the City's 2020 Plan was prepared using management documents including the City's "*2020 Water System Master Plan*", the City's *"2018 Hazard Mitigation Plan"*, and the San Bernardino County's "*2017 San Bernardino County Multi-Jurisdictional Hazard Mitigation Plan*".

The City is a member agency of various wholesale agencies including the Chino Basin Desalter Authority (CDA), Inland Empire Utilities Agency (IEUA), and the Water Facilities Authority (WFA). CDA, IEUA, and WFA have each individually prepared a 2020 Plan which are incorporated in the City's 2020 Plan by reference. In addition, the City provided its 2020 Plan to CDA, IEUA, and WFA, which includes water use projections in five-year increments for a normal year, a single dry year, and a five consecutive year drought over the next 25 years.

The City is a shareholder in, and purchases water from, San Antonio Water Company (SAWCo). The City receives water from SAWCo based upon the City's proportional number of shares and the water supply available to SAWCo.

1.3 UWMPS AND GRANT OR LOAN ELIGIBILITY

Pursuant to DWR's Final 2020 UWMP Guidebook:

"*In order for a Supplier to be eligible for any water grant or loan administered by DWR, the Supplier must have a current UWMP on file that has been determined by DWR to address the requirements of the Water Code. A current UWMP must also be maintained by the Supplier throughout the term of any grant or loan administered by DWR. A UWMP may also be required in order to be eligible for other state funding, depending on the conditions that are specified in the funding guidelines. Suppliers are encouraged to seek guidance on the specifics of any state funding source from the respective funding agencies. The following sections of the Water Code are pertinent to Suppliers considering pursuit of grants or loans*."

The City's 2020 Plan has been prepared to meet eligibility requirements for grants and loans administered by the State and/or DWR.

1.4 DEMONSTRATION OF CONSISTENCY WITH THE DELTA PLAN FOR PARTICIPANTS IN COVERED ACTIONS

Pursuant to DWR, an urban water supplier that anticipates participating in or receiving water from a proposed project (or "covered action") such as a multi-year water transfer, conveyance facility, or new diversion that involves transferring water through, exporting water from, or using water in the Sacramento-San Joaquin Delta (Delta) should provide information in their 2015 and 2020 UWMPs for use in demonstrating consistency with Delta Plan Policy WR P1, "*Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance*". In addition, pursuant to California Code of Regulations, Title 23, § 5003:

> *(c)(1) Water suppliers that have done all of the following are contributing to reduced reliance on the Delta and improved regional self-reliance and are therefore consistent with this policy:*
>
> > *(A) Completed a current Urban or Agricultural Water Management Plan (Plan) which has been reviewed by the California Department of Water Resources for compliance with the applicable requirements of Water Code Division 6, Parts 2.55, 2.6, and 2.8;*
> >
> > *(B) Identified, evaluated, and commenced implementation, consistent with the implementation schedule set forth in the Plan, of all programs and projects included in the Plan that are locally cost effective and technically feasible which reduce reliance on the Delta; and*
> >
> > *(C) Included in the Plan, commencing in 2015, the expected outcome for measurable reduction in Delta reliance and improvement in regional self-reliance. The expected outcome for measurable reduction in Delta reliance and improvement in regional self-reliance shall be reported in the Plan as the reduction in the amount of water used, or in the percentage of water used, from the Delta watershed. For the purposes of reporting, water efficiency is considered a new source of water supply, consistent with Water Code section 1011(a).*

The City has reduced its reliance on imported water supplies for FY 2014-15 and FY 2019-20. In addition, the City is projected to continue reducing its reliance on imported water supplies through FY 2044-45. A further discussion which demonstrates the City's measurable reduction imported water reliance and improvement in regional self-reliance is provided in Appendix B.

1.5 TIPS FOR UWMP PREPARERS

The City's 2020 Plan (which includes the City's 2020 Water Shortage Contingency Plan (WSCP) is considered an update to the City's 2015 Plan. However, the 2020 Plan and the WSCP are considered stand-alone documents. As discussed in Section 1.1, the City's 2020 Plan was prepared consistent with the recommended organization provided in DWR's Final 2020 UWMP Guidebook.

A checklist of specific UWMP requirements is included in Appendix C. The checklist includes the page number where the required elements are addressed to assist in DWR's review of the submitted Plan.

Chapter 2

PLAN PREPARATION

LAY DESCRIPTION – CHAPTER 2

PLAN PREPARATION

Chapter 2 (Plan Preparation) of the City's 2020 Plan discusses and provides the following:

- The basis for preparing an Urban Water Management Plan is provided. The City is required to prepare the 2020 Plan because it is an "urban water supplier" (the City serves more than 3,000 customers and it supplies more than 3,000 acre-feet of water annually to its customers for municipal purposes).
- The City is a "Public Water System" and is regulated by the State Water Resources Control Board - Division of Drinking Water. The City's Public Water System number is provided in Table 2-1.
- The City's Plan has been prepared as an "individual" plan rather than a "regional" plan in an effort to provide information specific to the City to best inform its employees, management, and customers.
- Information presented in the City's 2020 Plan is provided on "fiscal year" basis which is from July 1 through June 30 of the following year.
- Water quantities presented in the City's 2020 Plan are provided on an "acre-foot" basis.
- The City's coordination and outreach efforts with wholesale water agencies, other retail water agencies, and the community are described. The City coordinated the preparation of its 2020 Plan with the Chino Basin Watermaster, Chino Basin Desalter Authority, Cucamonga Valley Water District, Fontana Water Company, Inland Empire Utilities Agencies, Monte Vista Water District, Metropolitan Water District (MWD) of Southern California, Santa Ana Watershed Project Authority, San Antonio Water Company, and Water Facilities Authority.
- The City's notification process to the cities and county which the City provides water to is discussed.

2.1 PLAN PREPARATION

As discussed in Section 1.1, the City's 2020 UWMP was prepared consistently with the recommended organization provided in DWR's Final 2020 UWMP Guidebook. Pursuant to DWR's Final 2020 UWMP Guidebook:

"*The [CWC] specifies several requirements for preparing a UWMP, including who is required to prepare a UWMP; how to prepare a UWMP, depending on whether the Supplier choses to* *participate in a regional or individual planning effort; selection of reporting year-type; and coordination, notification, and outreach.*"

Pursuant to CWC requirements, the City's 2020 Plan incorporates DWR's water use and supply tables (standardized tables) for the reporting and submittal of UWMP data.

2.2 BASIS FOR PREPARING A PLAN

CWC 10617.

"Urban water supplier" means a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. An urban water supplier includes a supplier or contractor for water, regardless of the basis of right, which distributes or sells for ultimate resale to customers. This part applies only to water supplied from public water systems subject to Chapter 4 (commencing with Section 116275) of Part 12 of Division 104 of the Health and Safety Code.

CWC 10620.

(b) Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.

CWC 10621.

(a) Each urban water supplier shall update its plan at least once every five years on or before July 1, in years ending in six and one, incorporating updated and new information from the five years preceding each update.

The City's 2020 Plan was prepared in accordance with the UWMP Act which was established in 1983. The UWMP Act requires every "urban water supplier" to prepare and adopt a Plan, to review its Plan at least once every five years and make any amendments or changes which are indicated by the review. An "urban water supplier" is defined as "a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet (AF) of water annually." (CWC 10617.)

Section 10621(a) of the CWC states, "*[e]ach urban water supplier shall update its plan at least once every five years on or before July 1, in years ending in six and one, incorporating updated and new information from the five years preceding each update".* As a result, DWR requires the 2020 Plans be submitted by July 1, 2021.

The City is an "urban water supplier" pursuant to Section 10617 of the CWC and directly serves potable water to more than 3,000 customers and supplies more than 3,000 acre-feet per year (AFY) at retail for municipal purposes. The City's 2020 Plan is an update to the City's 2015 Plan.

2.2.1 PUBLIC WATER SYSTEMS

CWC 10644.

(a)(2) The plan, or amendments to the plan, submitted to the department ... shall include any standardized forms, tables, or displays specified by the department.

California Health and Safety Code 116275.

(h) "Public Water System" means a system for the provision of water for human consumption through pipes or other constructed conveyances that has 15 or more service connections or regularly serves at least 25 individuals daily at least 60 days out of the year.

Pursuant to CWC requirements, the City's 2020 Plan incorporates DWR's standardized tables for the reporting and submittal of UWMP data. The standardized tables are provided within the body of the 2020 Plan text as well as in Appendix A. The City also submitted the UWMP data (from the standardized tables) electronically through DWR's Online Submittal Tool.

In addition, the City is a Public Water System and is regulated by the State Water Resources Control Board - Division of Drinking Water (SWRCB-DDW). The SWRCB-DDW requires water agencies to provide the number of connections, water usage, and other information annually. The information provided to SWRCB-DDW indicates the City serves potable water to more than 3,000 customers and supplies more than 3,000 AFY. Table 2-1 provides the City's Public Water System name and number.

2.2.2 SUPPLIERS SERVING MULTIPLE SERVICE AREAS / PUBLIC WATER SYSTEMS

The City serves only a single Public Water System. Table 2-1 provides the City's Public Water System name and number.

Table 2-1 Public Water Systems

Submittal Table 2-1 Retail Only: Public Water Systems			
Public Water System Number	Public Water System Name	Number of Municipal Connections 2020	Volume of Water Supplied 2020 *
Add additional rows as needed			
3610034	Ontario Municipal Utilities Company	36,514	39,921
	TOTAL	36,514	39,921
**** Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*			
NOTES: The "Volume of Water Supplied 2020" includes recycled water supplies of 7,812 AF. Source for "Number of Municipal Connections 2020": https://sdwis.waterboards.ca.gov/PDWW/			

2.3 REGIONAL PLANNING

The City has developed its 2020 Plan reporting solely on its service area to address all requirements of the California Water Code. The City's 2020 Plan was not developed as a Regional Plan.

2.4 INDIVIDUAL OR REGIONAL PLANNING AND COMPLIANCE

As shown in Table 2-2, the City's 2020 Plan is an "Individual UWMP". The City has developed its 2020 Plan reporting solely on its service area to address all requirements of the California Water Code, including water use targets and baselines pursuant to SB X7-7 Water Conservation Act of 2009 reporting (discussed further in Chapter 5). The City notified and coordinated with appropriate regional agencies and constituents (See Section 2.6).

Table 2-2 Plan Identification Type

Submittal Table 2-2: Plan Identification			
Select Only One	**Type of Plan**		**Name of RUWMP or Regional Alliance** *if applicable* (select from drop down list)
☑	**Individual UWMP**		
	☐	Water Supplier is also a member of a RUWMP	
	☐	Water Supplier is also a member of a Regional Alliance	
☐	**Regional Urban Water Management Plan (RUWMP)**		
NOTES:			

2.4.1 REGIONAL UWMP

CWC 10620.

(d)(1) An urban water supplier may satisfy the requirements of this part by participation in area wide, regional, watershed, or basin wide urban water management planning where those plans will reduce preparation costs and contribute to the achievement of conservation and efficient water use.

As indicated in Table 2-2, the City's 2020 Plan was developed as an "Individual UWMP" and not as part of a Regional Plan.

2.4.2 REGIONAL ALLIANCE

CWC 10608.20.

(a)(1) …Urban retail water suppliers may elect to determine and report progress toward achieving these targets on an individual or regional basis, as provided in subdivision (a) of Section 10608.28…

CWC 10608.28.

(a) An urban retail water supplier may meet its urban water use target within its retail service area, or through mutual agreement, by any of the following:

(1) Through an urban wholesale water supplier.

(2) Through a regional agency authorized to plan and implement water conservation, including, but not limited to, an agency established under the Bay Area Water Supply and Conservation Agency Act (Division 31 (commencing with Section 81300)).

(3) Through a regional water management group as defined in Section 10537.

(4) By an integrated regional water management funding area.

(5) By hydrologic region.

(6) Through other appropriate geographic scales for which computation methods have been developed by the department.

(b) A regional water management group, with the written consent of its member agencies, may undertake any or all planning, reporting, and implementation functions under this chapter for the member agencies that consent to those activities. Any data or reports shall provide information both for the regional water management group and separately for each consenting urban retail water supplier and urban wholesale water supplier.

As indicated in Table 2-2, the City's 2020 Plan was developed as an "Individual UWMP" and not part of a Regional Alliance.

2.5 FISCAL OR CALENDAR YEAR AND UNITS OF MEASURE

CWC 10608.20.

(a)(1) Urban retail water suppliers…may determine the targets on a fiscal or calendar year basis.

2.5.1 FISCAL OR CALENDAR YEAR

The data provided in the City's 2020 Plan is reported on a fiscal year (FY) basis, unless noted otherwise, as shown in Table 2-3. A fiscal year begins on July 1st of every year.

Table 2-3 Supplier Identification

Submittal Table 2-3: Supplier Identification	
Type of Supplier (select one or both)	
☐	Supplier is a wholesaler
☑	Supplier is a retailer
Fiscal or Calendar Year (select one)	
☐	UWMP Tables are in calendar years
☑	UWMP Tables are in fiscal years
If using fiscal years provide month and date that the fiscal year begins (mm/dd)	
07/01	
Units of measure used in UWMP * (select from drop down)	
Unit	AF
**** Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*	
NOTES:	

2.5.2 REPORTING COMPLETE 2020 DATA

The data provided in the City's 2020 Plan is provided on a fiscal year basis through June 30, 2020.

2.5.3 UNITS OF MEASURE

As shown in Table 2-3, the data provided in the City's 2020 Plan is reported in units of acre-feet (AF), unless noted otherwise.

2.6 COORDINATION AND OUTREACH

CWC 10631.

(h) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (f). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (f).

2.6.1 WHOLESALE AND RETAIL COORDINATION

The City is a member agency of CDA, IEUA, and WFA. As indicated in Table 2-4, the City has provided its 2020 Plan to CDA, IEUA, and WFA, which includes water use projections in five-year increments for a normal year, a single dry year, and a five consecutive year drought over the next 25 years.

The City is a shareholder in SAWCo, a private water company. The City obtains water supply based on its proportional number of shares and the amount of water available to SAWCo.

Table 2-4 Water Supplier Information Exchange

Submittal Table 2-4 Retail: Water Supplier Information Exchange
The retail Supplier has informed the following wholesale supplier(s) of projected water use in accordance with Water Code Section 10631.
Wholesale Water Supplier Name
Add additional rows as needed
Chino Basin Desalter Authority
Inland Empire Utilities Agency
San Antonio Water Company
Water Facilities Authority
NOTES:

2.6.2 COORDINATION WITH OTHER AGENCIES AND THE COMMUNITY

CWC 10620.

(d)(3) Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.

CWC 10642.

Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of both the plan…

The City of Ontario is a retail water supplier that serves customers in the City of Ontario. The City is required to coordinate the preparation of the Plan with appropriate agencies in the area, including appropriate water suppliers that share a common source. Therefore, the City coordinated the preparation of its 2020 Plan with the Chino Basin Watermaster, CDA, Cucamonga Valley Water District, Fontana Water Company, IEUA, Monte Vista Water District, MWD, Santa Ana Watershed Project Authority, SAWCo, and WFA. As discussed in Section 10.2, the City notified these agencies, as well as the cities and county within which the City provides water supplies, at least sixty (60) days prior to the public hearing of the preparation of the 2020 Plan and invited them to participate in the development of the 2020 Plan. A copy of the notification letters sent to these agencies is provided in Appendix D.

2.6.3 NOTICE TO CITIES AND COUNTIES

CWC 10621.

(b) Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days before the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan.

As discussed in Section 10.2, notification that the City was reviewing and considering amendments (updates) to the previous 2015 Plan, and preparing the 2020 Plan was provided to the cities and counties for which the City provides water supplies. Notification was provided at least 60 days prior to the public hearing (see Appendix D).

Chapter 3

SYSTEM DESCRIPTION

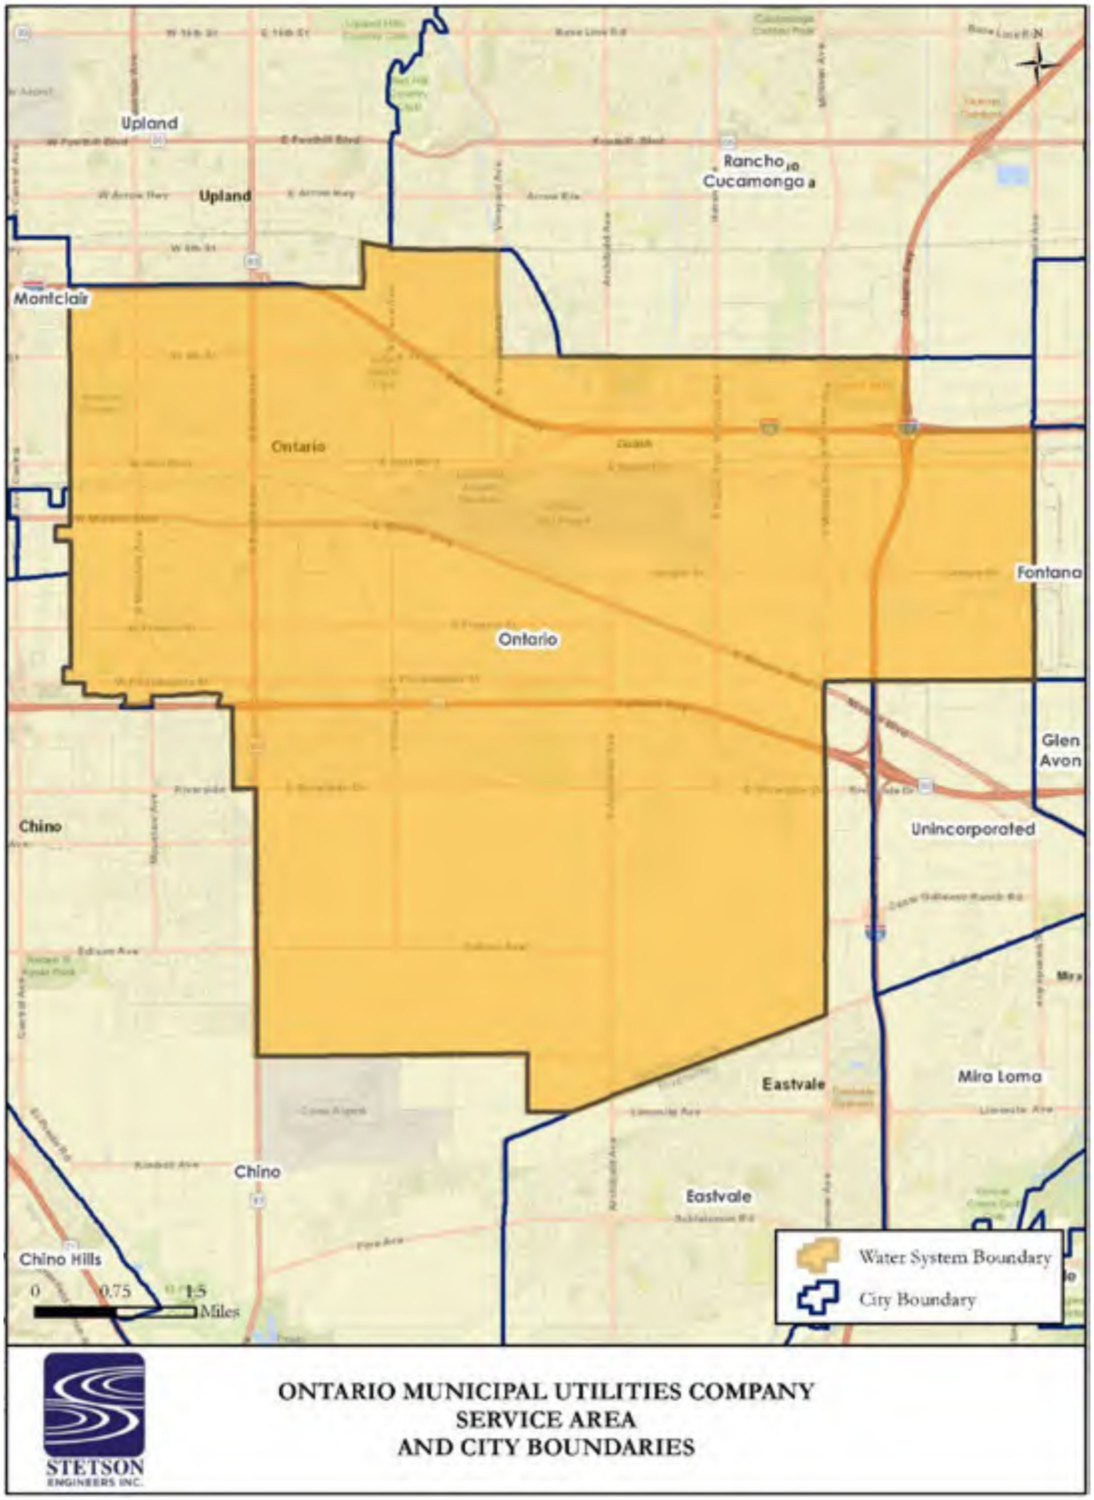
LAY DESCRIPTION – CHAPTER 3

SYSTEM DESCRIPTION

Chapter 3 (System Description) of the City's 2020 Plan discusses and provides the following:

- A description of the City's service area is provided. The City is located approximately 35 miles easterly of downtown Los Angeles in the County of San Bernardino. The City is bounded by the Cities of Chino and Montclair to the west; the Cities of Rancho Cucamonga and Upland to the north; the City of Fontana to the east; and the Cities of Chino and Eastvale to the south.
- The City's water service area encompasses an area of approximately 49 square miles. The location of the City's water service area is provided in Figure 1.
- A description regarding the City's water service area climate is provided. The monthly historical average temperatures (including minimum and maximum), monthly historical average rainfall, and monthly evapotranspiration (ETo) in the vicinity of the City's service area is summarized. The sources of the climate information are also discussed.
- The population within the City's water service area is discussed and projected. The sources of the population information are also discussed. The City provides water service to an area with a current population of 178,409. The City is projected to have a population of 362,903 by Fiscal Year 2044-45.
- A discussion of land use information used by the City to develop the 2020 Plan is provided. The City reviewed the current and projected land uses within its service area. The City also reviewed data provided by the Southern California of Governments, the Department of Finance, and the United States Census Bureau and prepared for counties, cities, and unincorporated areas within Southern California.

Figure 1 – Water Service Area and City Boundaries



3.1 GENERAL DESCRIPTION

CWC 10631.

(a) Describe the service area of the supplier, including current and projected population, climate, and other social, economic, and demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available. The description shall include the current and projected land uses within the existing or anticipated service area affecting the supplier's water management planning. Urban water suppliers shall coordinate with local or regional land use authorities to determine the most appropriate land use information, including, where appropriate, land use information obtained from local or regional land use authorities, as developed pursuant to Article 5 (commencing with Section 65300) of Chapter 3 of Division 1 of Title 7 of the Government Code.

The City of Ontario was founded in 1881 and was officially incorporated in 1891. The City is located approximately 35 miles easterly of downtown Los Angeles in the County of San Bernardino. The City is bounded by the Cities of Chino and Montclair to the west; the Cities of Rancho Cucamonga and Upland to the north; the City of Fontana to the east; and the Cities of Chino and Eastvale to the south.

The predominant land developments found within the City's service area are residential, commercial, industrial, and agricultural. Since acquiring new land in 1999, the City's service area is divided between two districts known as the Old Model Colony (OMC) and the Ontario Ranch (OR). The OMC area is mostly composed of residential, commercial, and industrial developments, including the Ontario International Airport, whereas the OR area is predominantly an agricultural development with plans to be redeveloped for residential, commercial, industrial, and public uses. Large areas of the OR already have been or are currently undergoing redevelopment.

3.2 SERVICE AREA BOUNDARY MAPS

The City's service area covers approximately 49 square miles encompassing most of the City of Ontario. The City's water service area boundary relative to the City of Ontario's municipal boundary is provided in Figure 1.

The City's service area map was submitted online through DWR's Population Tool in a "KML" file format (i.e. Google Earth format). The KML file was originally created in a Geographical Information Systems (GIS) shape file format and converted into a KML format. To the extent information was available, metadata was included in the KML file (including map projection, contact information, start and end dates for which the map is valid, constraints, attribute table definitions, and digitizing base).

3.3 SERVICE AREA CLIMATE

CWC 10631.

(a) Describe the service area of the supplier, including … climate…

CWC 10630.

It is the intention of the Legislature, in enacting this part, to permit levels of water management planning commensurate with the numbers of customers served and the volume of water supplied, while accounting for impacts from climate change.

The monthly historical average temperatures (including minimum and maximum), monthly historical average rainfall, and monthly evapotranspiration in the vicinity of the City's service area is summarized in the tabulation below. Historical climate information was obtained from the Western Regional Climate Center (WRCC), the National Oceanic and Atmospheric Administration, and from DWR's California Irrigation Management Information System (CIMIS).

Service Area Climate Information

Month	Average Temperature (F)	Average Minimum Temperature (F)	Average Maximum Temperature (F)	Average Total Precipitation (Inches)	ETo (Inches)
January	55.47	44.06	67.63	2.17	1.95
February	55.12	44.85	67.44	2.69	2.41
March	58.82	48.21	58.82	1.27	3.75
April	60.93	51.00	74.85	0.87	4.55
May	67.88	55.61	79.62	0.30	5.19
June	71.22	59.78	86.23	0.01	5.97
July	77.76	64.70	93.08	0.05	6.60
August	78.88	65.16	94.20	0.03	6.41
September	75.39	62.90	90.75	0.11	4.88
October	67.78	56.58	82.00	0.46	3.46
November	58.87	48.62	73.87	0.85	2.31
December	54.68	43.22	66.20	1.86	1.72
Annual	65.23	53.73	77.89	10.68	49.20

Source:

Historical average monthly precipitation and temperature information was obtained from the National Oceanic and Atmospheric Administration (https://search.usa.gov/search?utf8=%E2%9C%93&affiliate=noaa.gov&query=ontario+ca) from 1998 through 2020 (for Ontario International Airport). Historical monthly average ETo information was obtained from the California Irrigation Management Information Systems (http://wwwcimis.water.ca.gov) and is based on data collected from Station 255 (Chino).

The historical average rainfall in the vicinity of the City's service area is 10.68 inches. The City's service area has a dry climate and summers can reach average maximum daily temperatures in the high 80s to low 90s. The City's water supplies and demands are projected during average year, single dry year and a five consecutive year drought (See Chapter 7), and are based on historical data and projected demands. Nonetheless, it is recognized changes in climatic conditions may have an impact on water supplies (as discussed in Section 4.5). Precipitation within the vicinity of the City's service area is discussed further in Section 7.2.

A discussion of the City's sources of supply, how those sources may be impacted by climate change, and the proactive actions the City and other local/regional water managers may take to address the potential climate change on water supplies is provided in Section 4.5.

3.4 SERVICE AREA POPULATION AND DEMOGRAPHICS

3.4.1 SERVICE AREA POPULATION

CWC 10631.

(a) Describe the service area of the supplier, including current and projected population… The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.

The City provides water service to an area with a current population of 178,409. Table 3-1 presents the current and projected population of the area encompassed by the City's service area from FY 2019-20 to FY 2044-45. The City is projected to have a population of 362,903 by FY 2044-45.

The City initially reviewed the available historical populations within its service area for population growth trends. The City determined historical U.S. Census populations within its service area using DWR's Population Tool (https://wuedata.water.ca.gov/). The City's service area boundary was uploaded to DWR's Population Tool in a "KML" file format (i.e., Google Earth format). The KML file was originally created in a GIS shapefile format and converted into a KML format. The uploaded KML file represents the City's service area boundary from 1990 to present (2020). DWR's Population Tool utilized U.S. Census data from 1990, 2000, and 2010. The calculated FY 2019-20 population (discussed in Section 5.4) was used to determine compliance with the City's SB X7-7 water use target for 2020 (discussed in Section 5.5).

Projected populations in the City's service area were based on growth rate projections obtained from data provided by SCAG. The data provided by SCAG was based on their "*The 2020-2045 Regional Transportation Plan / Sustainable Communities Strategy of the SCAG*", dated September 2020, and incorporates demographic trends, existing land use, general plan land use policies, and input and projections through the year 2045 from the Department of Finance (DOF) and the US Census Bureau for counties, cities and unincorporated areas within Southern California.

Table 3-1 Population – Current and Projected

Submittal Table 3-1 Retail: Population - Current and Projected						
Population Served	2020	2025	2030	2035	2040	2045*(opt)*
	178,409	232,583	266,339	300,095	362,903	362,903
NOTES: The 2020 population and the populations projected through 2045 were obtained the City of Ontario's 2020 Water Master Plan (See Section 3.4.1 and Section 5.4.1). Population is equal for years 2040 and 2045 because the City anticipates buildout to occur in 2040.						

3.4.2 OTHER SOCIAL, ECONOMIC, AND DEMOGRAPHIC FACTORS

CWC 10631.

(a) Describe the service area of the supplier, including… other social, economic, and demographic factors affecting the supplier's water management planning.

Many families within the City's water service area have special housing needs. They are the severely low-income earners, single-parent families, large families, seniors, people with disabilities, and homeless persons. Pursuant to the California Census' "Census 2020 California Hard-to-Count Fact Sheet, Census 2020 California Hard-to-Count Fact Sheet" approximately 28.1 percent of the population within the City has an income level below 150 percent of the poverty level. The City current has a vacancy rate of approximately 6.2 percent. In addition, approximately 46.5 percent of households are renter occupied. Extremely low income earners account for most renters because homeownership is essentially infeasible for them. Significant financial subsidies are necessary to assist extremely low-income earners in acquiring affordable housing. The City's efforts in providing this assistance are concentrated on rental housing vouchers. Large families are typically more prone to overpayment since they require bigger houses. Those who live in cheaper, smaller apartments experience overcrowding and substandard living conditions. To solve the housing problem among large families and single-parent households, the City offers low cost units at mobile home parks, deed restricted apartments, and units in publicly assisted multi-family housing projects. Additional units, part of the Ontario Town Square project, are also planned to be built. The City has considered these demographic factors which can affect the City's water management planning. Increased population will also have an impact on water demand.

3.5 LAND USES WITHIN SERVICE AREA

CWC 10631.

(a) The description shall include the current and projected land uses within the existing or anticipated service area affecting the supplier's water management planning. Urban water suppliers shall coordinate with local or regional land use authorities to determine the most appropriate land use information, including, where appropriate, land use information obtained from local or regional land use authorities.

The City reviewed the current and projected land uses within its service area during the preparation of this 2020 Plan. Information regarding current and projected land uses is included in the City's General Plan and the City's 2020 Water Master Plan. Information regarding current and projected land uses identified in the City's 2020 Water Master Plan is provided in Appendix E. The existing land uses within the City's service area include residential (single-family and multi-family), commercial, industrial, and agricultural developments. Pursuant to the City's 2020 Water Master Plan Update, approximately 6,124 acres of the City's total land area use is currently attributed to residential use. Commercial and industrial use accounts for approximately 7,508 acres. Additionally, agricultural use comprises of 6,740 acres (184 acres within the Original Model Colony and 6,556 acres within the Ontario Ranch area).

The City anticipates the Ontario Ranch area will be converted from primarily agricultural land use to other land uses as the City transitions to buildout. As a result, land area for residential purposes is estimated to increase from its current amount of 6,124 acres to 10,869 acres at buildout. Additionally, land area for commercial and industrial purposes is projected to increase from 7,508 acres to 11,017 acres at buildout. In addition, the projected population within the City's service area is anticipated to increase (as discussed in Section 3.4). A discussion of the existing and projected water uses for the individual water use sectors within the City's service area, which includes the different land uses, is provided in Section 4.2. As discussed in Section 2.6, the City coordinated the preparation of the 2020 Plan with the City of Ontario, the County of San Bernardino, and other agencies.

As discussed in Section 3.4, the City obtained data from the Southern California Association of Governments document entitled "*The 2020-2045 Regional Transportation Plan / Sustainable Communities Strategy of the SCAG*", dated September 2020. Projected populations in the City's service area were based on growth rate projections developed by SCAG. The data provided by SCAG incorporates demographic trends, existing land use, general plan land use policies, and input and projections through the year 2045 from the Department of Finance and the US Census Bureau for counties, cities and unincorporated areas within Southern California.

Chapter 4

WATER USE CHARACTERIZATION

LAY DESCRIPTION – CHAPTER 4

WATER USE CHARACTERIZATION

Chapter 4 (Water Use Characterization) of the City's 2020 Plan discusses and provides the following:

- The City provides water service to individual "water use sectors". These water use sectors include single-family residential, multi-family, commercial, institutional (and governmental), landscape, and industrial. Individual descriptions for these water use sectors are provided in Section 4.2.1.
- The City's total water demands (including potable and recycled water) over the past 10 years have ranged from 36,036 AFY to 45,196 AFY, with an average of 40,831 AFY. The City currently measures its water use through meter data and billing records.
- The City conducts an annual water loss audit to identify distribution system water losses. Water losses can result from pipeline leaks and inaccurate metering due to faulty meters. Water loss estimates are incorporated into the City's projected water demands.
- The City's current and projected water demands are provided in five-year increments over the next 25 years are provided (through Fiscal Year 2044-45) as shown on Table 4-3.
- The City's water demand projections incorporate water savings which are the result of implementation of new plumbing codes along with consumer awareness of the need to conserve water.
- The projected water demands for lower income households are identified and are included in the City's total projected water demands
- The City's sources of water supply and how those sources may be impacted by climate change are discussed. The proactive actions the City and other local/regional water managers may take to address the potential climate change impacts on water supplies are also discussed.

The City will be able to provide sufficient water supplies to meet the projected water demands of its customers, including during a five consecutive year drought period.

4.1 NON-POTABLE VERSUS POTABLE WATER USE

The Water Code requires a description and quantification of water uses within the City's service area, including both non-potable and potable water. Recycled water (non-potable) uses are addressed in Section 6.5; however, a summary is provided in Table 4-3. Furthermore, Chapter 4 addresses the City's potable water demands.

4.2 PAST, CURRENT, AND PROJECTED WATER USES BY SECTOR

CWC 10635.

(a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the long-term total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and a drought lasting five consecutive water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.

CWC 10631.

(d)(1) For an urban retail water supplier, quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, based upon information developed pursuant to subdivision (a), identifying the uses among water use sectors, including, but not necessarily limited to, all of the following…

(2) The water use projections shall be in the same five-year increments described in subdivision (a).

(4)(A) Water use projections, where available, shall display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans identified by the urban water supplier, as applicable to the service area.

(B) To the extent that an urban water supplier reports the information described in subparagraph (A), an urban water supplier shall do both of the following:

> *(i) Provide citations of the various codes, standards, ordinances, or transportation and land use plans utilized in making the projections.*
>
> *(ii) Indicate the extent that the water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. Water use projections that do not account for these water savings shall be noted of that fact.*

The City's current and projected water demands are provided in five-year increments over the next 25 years (through FY 2044-45) in Tables 4-1, 4-2, and 4-3. The City's total water demands were projected based on a review of the SB X7-7 calculations which are discussed in Chapter 5 (including the SB X7-7 water use target for 2020), current water use factors based on recent water demands, the City of Ontario's Water Master Plan Update 2020, the City of Ontario Recycled Water Master Plan Update 2020, and the total population projections based on land use trends within the City.

The City provides water service to individual "water use sectors" as identified by the California Water Code. The water use sectors supplied by the City are discussed in Section 4.2.1. The water use for each of these sectors during FY 2019-20 is provided in Table 4-1. The projected water use for each individual water use sector is provided in Table 4-2 and is based on the percentage breakdown of water use from each individual water use sector in FY 2019-20 (the percentages were then applied to the projected total water use).

Table 4-1 Demands for Potable and Non-Potable Water - Actual

Submittal Table 4-1 Retail: Demands for Potable and Non-Potable[1] Water - Actual			
Use Type	2020 Actual		
Drop down list May select each use multiple times These are the only Use Types that will be recognized by the WUEdata online submittal tool	Additional Description (as needed)	Level of Treatment When Delivered Drop down list	Volume[2]
Add additional rows as needed			
Single Family		Drinking Water	12,502
Multi-Family		Drinking Water	5,068
Commercial		Drinking Water	5,359
Industrial		Drinking Water	2,078
Institutional/Governmental		Drinking Water	538
Landscape		Drinking Water	4,631
Losses		Drinking Water	1,565
Other	Hydrant	Drinking Water	368
		TOTAL	32,109

[1] *Recycled water demands are NOT reported in this table. Recycled water demands are reported in Table 6-4.*
[2] *Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.*

NOTES: Recycled water demands are provided in Table 4-3 and Table 6-4.

Table 4-2 Use for Potable and Non-Potable Water - Projected

Submittal Table 4-2 Retail: Use for Potable and Non-Potable[1] Water - Projected						
Use Type	Additional Description (as needed)	Projected Water Use[2] *Report To the Extent that Records are Available*				
Drop down list May select each use multiple times These are the only Use Types that will be recognized by the WUEdata online submittal tool		2025	2030	2035	2040	2045 (opt)
Add additional rows as needed						
Single Family		15,723	17,540	19,109	22,431	22,431
Multi-Family		6,374	7,110	7,746	9,093	9,093
Commercial		6,740	7,519	8,191	9,615	9,615

Institutional/Governmental		677	755	822	965	965
Landscape		5,824	6,497	7,078	8,309	8,309
Losses		1,968	2,196	2,392	2,808	2,808
Other		463	516	562	660	660
	TOTAL	40,382	45,048	49,076	57,609	57,609

[1] Recycled water demands are NOT reported in this table. Recycled water demands are reported in Table 6-4. [2] Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.

NOTES: Projected water use are equal for years 2040 and 2045 because the City anticipates buildout to occur in 2040.

Table 4-3 Total Gross Water Use (Potable and Non-Potable)

Submittal Table 4-3 Retail: Total Water Use (Potable and Non-Potable)						
	2020	2025	2030	2035	2040	2045 (opt)
Potable Water, Raw, Other Non-potable *From Tables 4-1R and 4-2 R*	32,109	40,382	45,048	49,076	57,609	57,609
Recycled Water Demand[1] *From Table 6-4*	7,812	12,168	13,465	14,762	16,059	16,059
Optional Deduction of Recycled Water Put Into Long-Term Storage[2]						
TOTAL WATER USE	39,921	52,550	58,513	63,838	73,668	73,668

[1] Recycled water demand fields will be blank until Table 6-4 is complete [2]
*Long term storage means water placed into groundwater or surface storage that is not removed from storage in the same year. Supplier **may** deduct recycled water placed in long-term storage from their reported demand. This value is manually entered into Table 4-3.*

NOTES: Projected total water use are equal for years 2040 and 2045 because the City anticipates buildout to occur in 2040.

4.2.1 WATER USE SECTORS LISTED IN WATER CODE

CWC 10631.

(d)(1) For an urban retail water supplier, quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, based upon information developed pursuant to subdivision (a), identifying the uses among water use sectors, including, but not necessarily limited to, all of the following:

(A) Single-family residential.
(B) Multifamily.
(C) Commercial.
(D) Industrial.
(E) Institutional and governmental.
(F) Landscape.
(G) Sales to other agencies.
(H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof.
(I) Agricultural.
(J) Distribution system water loss.

As shown in Table 4-1, the City's service area includes the following water use sectors listed in the California Water Code:

- Single-family residential
  (A single-family dwelling unit is a lot with a free-standing building containing one dwelling unit that may include a detached secondary dwelling. Single-family residential water demands are included in retail demands.)

- Multi-family
  (Multiple dwelling units are contained within one building or several buildings within one complex. Multi-family residential water demands are included in retail demands.)

- Commercial
  (Commercial users are defined as water users that provide or distribute a product or service)

- Institutional (and governmental)
  (Institutional users are defined as water user dedicated to public service. Institutional users include, among other users, higher education institutions, schools, courts, churches, hospitals, government facilities, and nonprofit research institutions.)

- Landscape
  (Landscape connections supply water solely for landscape irrigation. Landscape users may be associated with multi-family, commercial, industrial, or institutional/governmental sites, but are considered a separate water use sector if the connection is solely for landscape irrigation. Landscape water demands are included in retail demands.)

- Industrial
  (Industrial users are defined as water users that are primarily a manufacturer or processor of materials as defined by the North American Industry Classification System (NAICS) code sectors 31 to 33, inclusive, or an entity that is a water user primarily engaged in research and development. Industrial water demands are included in retail demands.)

- Agricultural
  (Water used for commercial agricultural irrigation. Agricultural water demands are included in recycled water retail demands.)

- Distribution system losses
  (Distribution system losses represent the potable water losses from the pressurized water distribution system and water storage facilities, up to the point of delivery to the customers. Additional information is discussed in Section 4.2.4)

4.2.2 WATER USE SECTORS IN ADDITION TO THOSE LISTED IN WATER CODE

The City's service area does not include other water demand sectors which are not listed in the California Water Code (including exchanges, surface water augmentation, transfers, and wetlands or wildlife habitat).

4.2.3 PAST WATER USE

Chapter 6 provides a discussion of the sources of water supply the City uses to meet its water demands. Section 6.1 provides a tabulation of the City's historical annual water demands for each water supply source. Over the past ten years, the City's total water demands (including potable and recycled water demands) have ranged from 36,036 AFY to 45,196 AFY, with an average of 40,831 AFY. In addition, the City recently experienced a five-consecutive-year-drought within its service area from FY 2011-12 to FY 2015-16. The City also reviewed its historical water demands to determine the projected water demands and water supply reliability (discussed in Chapter 7). The City is able to provide sufficient water supplies to meet the projected water demands of its customers, including during a five consecutive year drought period.

4.2.4 DISTRIBUTION SYSTEM WATER LOSS

CWC 10631.

(d)(1) For an urban retail water supplier, quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, based upon information developed pursuant to subdivision (a), identifying the uses among water use sectors, including, but not necessarily limited to, all of the following…

(J) Distribution system water loss.

CWC 10631.

(3)(A) The distribution system water loss shall be quantified for each of the five years preceding the plan update, in accordance with rules adopted pursuant to Section 10608.34.

(B) The distribution system water loss quantification shall be reported in accordance with a worksheet approved or developed by the department through a public process. The water loss quantification worksheet shall be based on the water system balance methodology developed by the American Water Works Association.

(C) In the plan due July 1, 2021, and in each update thereafter, data shall be included to show whether the urban retail water supplier met the distribution loss standards enacted by the board pursuant to Section 10608.34.

Distribution system water losses represent the potable water losses from the pressurized water distribution system and water storage facilities, up to the point of delivery to the customers. Sources of distribution system water loss can include: inaccurate metering due to faulty meters; water use not metered such as firefighting, flushing of the water system; and pipeline leaks.

The California Water Code Section 10608.34(b)(1) requires "[o]n or before October 1of each year until October 1, 2023, each urban retail water supplier shall submit a completed and validated water loss audit report for the previous calendar year or the previous fiscal year..." The water loss audits must follow American Water Works Association (AWWA) guidance and be validated by a certified water audit validator. The City has completed the annual water loss audit process through October 1, 2020, as required by the California Water Code (i.e. the City has completed water loss audits representing calendar years 2016, 2017, 2018, and 2019). The City's water loss audits were prepared and validated pursuant to DWR requirements. The annual water loss audit reports submitted by retail water agencies in California, including the City (provided in Appendix F), are available on DWR's website (https://wuedata.water.ca.gov/awwa_plans).

The City's annual water loss audits identify real water losses (e.g. leaks and main failures) and apparent water losses (e.g. customer meter inaccuracies, systematic data handling errors in customer billing systems, and unauthorized consumption). The City's distribution system water losses are based on the sum of the real and apparent water losses and are summarized in Table 4-4 for the past five years. Over the past five years, the City's average distribution system water losses represent approximately 2.9 percent of its total water demands. This average water loss factor was incorporated into the City's total potable water demand projections (Tables 4-2 and 4-3).

Table 4-4 12 Month Water Loss Audit Report

Submittal Table 4-4 Retail: Last Five Years of Water Loss Audit Reporting	
Reporting Period Start Date (mm/yyyy)	Volume of Water Loss [1,2]
07/2015	618
07/2016	1,325
07/2017	1,282
07/2018	1,031
07/2019	1,565
[1] *Taken from the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheet.* [2] ***Units of measure (AF, CCF, MG)*** *must remain consistent throughout the UWMP as reported in Table 2-3.*	
NOTES: The "Volume of Water Losses" from FY 2016-17 through FY 2018-19 are based on the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheets. Because the water loss audits are reported in calendar years, the volume of water losses were calculated to be an average of the two calendar years as part of that fiscal year. The volume of water losses for FY 2015-16 and FY 2019-20 (calendar years 2016 and 2020) were estimated based on water system metered production and sales data.	

The California Water Code Section 10608.34(i) directs the SWRCB to "adopt rules requiring urban retail water suppliers to meet performance standards for the volume of water losses." Pursuant to this law, and as discussed above, urban retail water suppliers (including the City) have been submitting water loss audits to DWR annually since October 2017. Pursuant to (SB) Senate Bill 606, urban retail water suppliers are required to calculate an "urban water use objective" that includes indoor, outdoor, commercial, industrial and institutional irrigation uses, and allowed system water loss by November 1, 2023. The City will continue to develop its water loss standard and urban water use objective pursuant to SWRCB requirements.

4.2.5 CURRENT WATER USE

The City currently measures its water use through meter data and billing records. The water use for the City's individual water use sectors during FY 2019-20 are provided in Table 4-1. Recycled water uses are addressed separately in Section 6.5; however, a summary of projected recycled water uses is provided in Table 4-3. The City's total water uses during FY 2019-20 have been reviewed for compliance with the SB X7-7 water use target for 2020 adopted in the City's 2015 Plan (discussed in Section 5.5).

DWR has created an optional "Planning Tool Worksheet" for water suppliers to review and assess monthly water use trends. DWR has deemed the tool as optional, and the City is not required by DWR to use the tool. Section 6.1 provides a tabulation of the City's historical annual water uses for each water supply source. During the past 10 years, the City experienced a five-consecutive-year-drought within its service area from FY 2011-12 to FY 2015-16. Historical records indicate the City's annual water demands had been greater prior to FY 2011-12. The City has been able to provide sufficient water supplies to its customers, including during long-term droughts and years with historically high water demands. In addition, the City has been able to provide water service to meet maximum day water demands for these years, including during the summer months. A further discussion regarding the reliability of the City's water supply sources is provided in Chapter 7.

4.2.6 PROJECTED WATER USE

CWC 10635.

(a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the long-term total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and a drought lasting five consecutive water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.

CWC 10631.

(h) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (f). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (f).

CWC 10631.

(d)(4)(A) Water use projections, where available, shall display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans identified by the urban water supplier, as applicable to the service area.

(d)(4)(B) To the extent that an urban water supplier reports the information described in subparagraph (A), an urban water supplier shall do both of the following:

(i) Provide citations of the various codes, standards, ordinances, or transportation and land use plans utilized in making the projections.
(ii) Indicate the extent that the water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. Water use projections that do not account for these water savings shall be noted of that fact.

The City's projected water demands are provided in five-year increments over the next 25 years (through FY 2044-45) in Table 4-3. The City's projected water demands and water supplies during a normal year, a single dry year, and a five consecutive year drought are provided in Chapter 7. The projected water demands for each of the City's water use sectors are provided in Table 4-2.

The City's water demands were projected based on a review of the SB X7-7 calculations discussed in Chapter 5 (including the SB X7-7 water use target for 2020), existing water use factors based on recent water demands, the total population projections based on projected land uses; and information identified in the City's 2020 Water Master Plan. The projected ultimate water demands at buildout (anticipated to occur in year 2040) for the water use sectors were determined using projected land uses and water & recycled water demand factors obtained from the City's 2020 Water Master Plan (see Appendix E) and 2020 Recycled Water Master Plan (see Section 6.2.5.4). A discussion of the City's water supplies from wholesalers CDA, IEUA, and WFA, are discussed in Section 6.2. As discussed in Section 2.6, the City has coordinated its water demand projections with CDA, IEUA, and WFA for each water use sector.

The City's water demand projections incorporate water savings, or "passive savings", which are the result of implementation of new plumbing codes along with consumer awareness of the need to conserve water. The City's Municipal Code Title 6, Chapter 8A "Water Conservation Plan", which was created through the adoption of Ordinance No. 3027 in October 2015 (discussed in Section 9.2), includes methods for current and ongoing reduction in water use and water waste. Prior to adoption of Ordinance No. 3027, the City's water use rate ranged from approximately 224 gallons per capita day to 264 gallons per capita day (from 1995 through 2004). As identified in Section 5.5, the City's actual water use rate during FY 2019-20 was 161 gallons per capita per day which is a decrease of up to 103 gallons per capita per day from the recent historical water use . The City's projected water demands use GPCD water use rates which are less than the City's established SB X7-7 water use target for 2020 and incorporate ongoing water passive savings and reduced water use resulting from the City's existing Water Conservation Plan. As indicated in Table 4-5, estimated future water savings have been considered as part of the City's water use projections.

Table 4-5 Inclusion in Water Use Projections

Submittal Table 4-5 Retail Only: Inclusion in Water Use Projections	
Are Future Water Savings Included in Projections? (Refer to Appendix K of UWMP Guidebook) *Drop down list (y/n)*	Yes
If "Yes" to above, state the section or page number, in the cell to the right, where citations of the codes, ordinances, or otherwise are utilized in demand projections are found.	Section 4.2.6 and Chapter 8
Are Lower Income Residential Demands Included In Projections? *Drop down list (y/n)*	Yes
NOTES:	

4.2.7 CHARACTERISTIC FIVE-YEAR WATER USE

CWC 10635.

(b) Every urban water supplier shall include, as part of its urban water management plan, a drought risk assessment for its water service to its customers as part of information considered in developing the demand management measures and water supply projects and programs to be included in the urban water management plan. The urban water supplier may conduct an interim update or updates to this drought risk assessment within the five-year cycle of its urban water management plan update. The drought risk assessment shall include each of the following. . .

(3) A comparison of the total water supply sources available to the water supplier with the total projected water use for the drought period.

(4) Considerations of the historical drought hydrology, plausible changes on projected supplies and demands under climate change conditions, anticipated regulatory changes, and other locally applicable criteria.

The City's projected water demands are provided in five-year increments over the next 25 years (and through FY 2044-45) in Table 4-3. The City's projected water demands and water supplies during a normal year, a single dry year, and a five consecutive year drought over the next 25 years (and through FY 2044-45) are provided in Chapter 7.

The City's "Drought Risk Assessment" (DRA) for the next five years (from FY 2020-21 through FY 2024-25) is discussed in Section 7.3. The DRA includes the City's projected annual water demands and supplies for each of the next five years and was prepared based on the five driest consecutive years on record. The DRA provides an assessment of the City's water service reliability during a drought lasting five years. The DRA reflects anticipated water demands and supplies prior to any expected benefits associated with water supply shortage responses included in the City's Water Shortage Contingency Plan (provided in Chapter 8). In addition to historical drought hydrology, the City considered impacts to water supplies and demands based on climate change conditions (discussed in Section 4.5) and anticipated regulatory changes, including the urban water use objectives (discussed in Section 4.2.4)

4.3 WORKSHEETS AND REPORTING TABLES

The City's current and projected water demands, including the water demands for each of the City's water use sectors, are provided in five-year increments over the next 25 years (and through FY 2044-45) in Tables 4-1, 4-2, and 4-3.

4.3.1 OPTIONAL PLANNING TOOL USE ANALYSIS WORKSHEET

As discussed in Section 4.2.5, DWR has deemed the "Planning Tool Worksheet" as optional and the City is not required by DWR to use the tool. In addition, the City has been able to provide sufficient water supplies to its customers, including during long-term droughts and years with historically high water demands. The City has also been able to provide water service to meet maximum day water demands for these years, including during the summer months. For these reasons, the City chose not to use the optional worksheet. A further discussion regarding the reliability of the City's water supply sources is provided in Chapter 7.

4.3.2 DWR 2020 UWMP SUBMITTAL TABLES

The City's current water demands for each of the water use sectors during FY 2019-20 are provided in Table 4-1. The City's projected water demands for each of the water use sectors, in five-year increments over the next 25 years (and through FY 2044-45), are provided in Table 4-2. The City's total projected water demands, including potable and recycled water, in five-year increments over the next 25 years (and through FY 2044-45), are summarized in Table 4-3. The City's distribution system water losses over the past five years, based on the sum of the real and apparent water losses, are summarized in Table 4-4. The City's annual AWWA water loss audits are provided in Appendix F.

4.4 WATER USE FOR LOWER INCOME HOUSEHOLDS

CWC 10631.1.

(a) The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.

California Health and Safety Code 50079.5.

(a) "Lower income households" means persons and families whose income does not exceed the qualifying limits for lower income families… In the event the federal standards are discontinued, the department shall, by regulation, establish income limits for lower income households for all geographic areas of the state at 80 percent of area median income, adjusted for family size and revised annually.

The City's water demands projections provided in Table 4-3 include projected water demands for lower income single-family and multi-family households. A lower income household is defined as a household with an income less than 80 percent of the area median income, adjusted for family size. For the purpose of this evaluation the entire San Bernardino County was used for the "area median income". The median household income within San Bernardino County was $67,903. The total number of lower income households within the City's service area was estimated based on billing records provided by the City, a review of the City's General Plan, a review of median household income range statistics provided by the US Census Bureau, and a review of GIS maps of Disadvantaged Communities[2] (DACs), including block groups, tracts, and places, provided by DWR. The estimated number of lower income households (i.e. with a median household income less than 80 percent of $67,903) located within the City's service area is approximately 34.5 percent of the total number of households. As indicated in Table 4-2, the total projected residential (single family and multi-family) water demands within the City in 2045 is estimated at about 31,524 AFY. Based on a 34.5 percent use factor of total residential water demands, the projected water demand for lower income households will be about 10,876 AFY by the FY 2044-2045. The projected water demands for lower income households were included in the City's total projected water demands, as indicated in Table 4-5.

4.5 CLIMATE CHANGE CONSIDERATIONS

CWC 10630.

It is the intention of the Legislature, in enacting this part, to permit levels of water management planning commensurate with the numbers of customers served and the volume of water supplied, while accounting for impacts from climate change.

CWC 10635.

(b) Every urban water supplier shall include, as part of its urban water management plan, a drought risk assessment for its water service to its customers as part of information considered in developing the demand management measures and water supply projects and programs to be included in the urban water management plan. The urban water supplier may conduct an interim update or updates to this drought risk assessment within the five-year cycle of its urban water management plan update. The drought risk assessment shall include each of the following…

[2] GIS information for DACs is based on data from the US Census showing census block groups, tracts, and places identified as disadvantaged communities (less than 80 percent of the State's median household income) or severely disadvantaged communities (less than 60 percent of the State's median household income)

(4) Considerations of the historical drought hydrology, plausible changes on projected supplies and demands under climate change conditions, anticipated regulatory changes, and other locally applicable criteria.

Climate is defined as "the average course or condition of the weather at a place usually over a period of years as exhibited by temperature, wind velocity and precipitation[3]". A change in the climate which produces a greater amount of precipitation (i.e. more runoff and/or snowpack) and lower temperatures is generally a benefit to water supplies. However, drought conditions which may result in decreased precipitation, decreased runoff, and increased temperature may adversely affect an urban water supplier's ability to meet demands by potentially impacting supplies. Consequently, the focus of impacts of climate change is on these adverse consequences.

Section 6.2 of this Plan describes the City's sources of water supply, management practices associated with those sources, and the long-term reliability of those sources. Section 7.3 includes a Drought Risk Assessment which considers the potential impacts of climate change to the City's water supply sources. Chapter 8 provides a detailed discussion of the City's Water Shortage Contingency Plan, including but not limited to, the six standard water shortage levels in the event climate change results in a reduction to water supplies associated with a periodic drought condition. The following is a discussion of the City's sources of supply, how those sources may be impacted by climate change, and the proactive actions the City and other local/regional water managers may take to address the potential climate change impacts on water supplies.

<u>Imported Water Supplies</u>

The City receives treated imported water (see Section 6.2.1 for a more in depth discussion). Consequently, the City directly and/or indirectly relies on the Metropolitan Water District of Southern California for those imported water supplies. MWD has prepared a Regional 2020 Urban Water Management Plan which includes a discussion (Section 2.6 in MWD's 2020 UWMP) of the reliability of its water supplies and the impacts of climate change and is incorporated by reference in this Plan. Furthermore, the City is a retail agency of the Inland Empire Utilities Agency which has also provided a discussion of climate change considerations and that discussion is included by reference. The following is a brief summary of MWD's efforts:

<u>Resource Planning</u>

- MWD has established the Robust Decision Making (RDM) approach to identify vulnerabilities to its water supplies. Climate change information was applied to MWD's simulated water supply scenarios to demonstrate the vulnerability of water supplies to climate change.

[3] www.merriam-webster.com

Knowledge Sharing and Research Support

- MWD is an active and founding member of the Water Utility Climate Alliance (WUCA) which includes 12 nationwide partners collaborating on climate change considerations. As such, MWD shares agency actions on climate change and adaptation. WUCA has also released numerous research papers on climate change.

Implementation of Programs and Policies

- MWD's programs include the use of solar energy, use of ride share programs, and reduction of greenhouse emissions. Collectively these actions are intended to impact the effects of climate change.

Groundwater Supplies

The City relies on groundwater produced from the Chino Basin as discussed in Section 6.2.2. The Chino Basin (Basin Number 8-2.01 pursuant to DWR Bulletin 118) has been identified by DWR as a very low-priority groundwater basin partially due to the fact it is adjudicated. In that regard, the Chino Basin is actively managed by the Chino Basin Watermaster and those management activities are described in detail in Section 6.2.2.

Recognizing the potential impacts of climate change on the Chino Basin groundwater supplies (decreased local runoff and replenishment, along with increased groundwater production which may lead to decreased groundwater levels), the City has used climate tools available on the California' Energy Commission's Cal-Adapt website (https://cal-adapt.org/) to identify potential future climate change cycles for the Chino Basin. The Cal-Adapt website has been developed by the Geospatial Innovation Facility at the University of California, Berkeley with funding and advisory oversight by the California Energy Commission and California Strategic Growth Council.

To address the uncertainty in future greenhouse gas emissions, Cal-Adapt has developed a Representative Concentration Pathway 4.5 (RCP 4.5) scenario and a Representative Concentration Pathway 8.5 (RCP 8.5) scenario. RCP 4.5 represents a scenario in which greenhouse gas emissions peak around 2040, then decline and stabilize. RCP 8.5 represents a scenario in which emissions continue to strongly rise through 2050 and plateau around 2100. RCP 4.5 is a "medium" emissions scenario that models in future in which there is an effort made by societies to reduce greenhouse gas emissions, whereas RCP 8.5 is a "business-as-usual" scenario. For the City's climate change analysis, the RCP 4.5 scenario was selected.

The Cal-Adapt climate tools also incorporate several General Circulation Models (GCMs), which represent physical processes in the atmosphere, ocean, and land surface. These GCMs projected future climates under conditions such as warm/dry, cooler/wetter, and average simulations. For the City's climate change analysis, the average condition GCM (CanESM2) was selected.

The climate tools available on the Cal-Adapt website were to simulate projected annual precipitation and annual average maximum temperature in the Chino Basin. An electronic boundary of the Chino Basin was submitted online through the Cal-Adapt website in a "KML" file format (i.e. Google Earth format) and data using several of the available climate tools was generated.

Based on the data generated by the Cal-Adapt simulations (see Appendix G), the average annual rainfall in the Chino Basin is projected to be 16.00 over the next 25 years (through 2045), inches compared to a historical average of 14.82 inches (from 1950 through 2019). In addition, the average maximum temperature is projected to be 82.1 degrees Fahrenheit compared to a historical average of 78.5 degrees Fahrenheit. Although there may be more precipitation in the future, it may be more likely to fall as rainfall compared to snowfall. The simulation does not denote the duration or intensity of the storms contributing to the annual precipitation. Notwithstanding, the Santa Ana River watershed (including the area of the Chino Bain) has a complex and interconnected series of dams, reservoirs and replenishment basins to capture stormwater runoff in the Santa Ana River watershed. Most if not all precipitation (whether it is rain or snowfall) likely will be captured during normal and dry year conditions and will not be adversely impacted by a potentially higher average annual temperature.

Recognizing these potential impacts to local hydrology resulting from climate change and the resultant impacts to the groundwater supplies, the Chino Basin Watermaster has taken (and may reinstate as needed) the following proactive actions to anticipate and circumvent the potential impacts of climate change. These actions will enable the City to rely on the Chino Basin as a reliable source of supply.

Chino Basin – Storage Management Plan

The Chino Basin Judgment parties adopted as part of the 2000 Chino Basin Peace Agreement a storage management plan, which consists of three types of storage agreements that result in five types of storage accounts: 1) Excess Carryover, 2) Local Supplemental-Recycled, 3) Local Supplemental-Imported, 4) Pre-2000 Quantified Supplemental, and 5) Storage and Recovery. An Excess Carryover account includes a Party's unproduced rights in the Safe Yield and Basin Water purchased or transferred from other Parties. A Local Supplemental Water account includes any imported and/or recycled water that is recharged by a producer and similar water acquired from other Parties. A Storage and Recovery Account includes Supplemental Water and is intended to produce a broad and mutual benefit to the Judgment Parties. The Chino Basin Watermaster maintains records of the replenishment, production, losses, and end-of-year storage totals for all storage accounts and reports this accounting on an annual basis.

Individual Parties are involved in water transfers of annual unproduced rights in the Safe Yield and water in their storage accounts. Chino Basin Watermaster has an application and review process for these transfers. The Parties engage in conjunctive-use activities individually by storing

Chino Basin and Supplemental Water that are in excess of their demands and may recover that water in the future as the need arises. These activities collectively cause temporary adjustment in the managed storage. The Parties' aggregate amount of water in managed storage was 541,845 AF during FY 2019-20.

MWD's Dry-Year Yield Program (DYYP), a water exchange, is the only active Storage and Recovery Program in the Chino Basin. The DYYP can store up to 100,000 AF with maximum replenishment of 25,000 AFY and maximum extraction of 33,000 AFY. During FY 2019-20, there was 45,961 AF within the DYYP account, resulting in a total managed storage volume of 587,806 AF (541,845 AF + 45,961 AF). The agreement that authorized the DYYP will expire in 2028.

Inland Empire Utilities Agency's "Addendum No. 2 to the Optimum Basin Management Program Project", completed in February 2021, amends the 2000 Chino Basin Peace Agreement's Programmatic Environmental Impact Report to address managed storage within the Chino Basin, consistent with the Local Storage Limitation Solution (LSLS). Consistent with Addendum No. 1, from July 1, 2017 through June 30, 2021, the Safe Storage Capacity of the Chino Basin is 600,000 AF. The LSLS proposes a change in the Safe Storage Capacity to 700,000 AF through June 30, 2030, and to 620,000 AFY from July 1, 2030 through June 30, 2035. Full utilization of the allowable increased storage space is expected to occur gradually as additional water is stored and less groundwater is produced. The Safe Storage Capacity of the Chino Basin will revert to 500,000 AF after June 30, 2035.

Chino Basin Safe Yield

The Chino Basin Judgment assessed the initial Safe Yield for the Chino Basin at 140,000 AFY, but reserved to re-determine the Safe Yield after ten years. Pursuant to the most recent Safe Yield reset effective July 2020, the Safe Yield in the Chino Basin is determined to be 131,000 AFY (through June 30, 2030). The Safe Yield is recalculated every 10 years and is defined in the Chino Basin Judgment as "the long-term average annual quantity of ground water (excluding replenishment of stored water but including return flow to the Basin from use of replenishment or stored water) which can be produced from the Chino Basin under conditions of a particular year without causing an undesirable result".

Chapter 5

SB X7-7 BASELINES, TARGETS, AND 2020 COMPLIANCE

LAY DESCRIPTION – CHAPTER 5

SB X7-7 BASELINES, TARGETS, AND 2020 COMPLIANCE

Chapter 5 (SB X7-7 Baselines, Targets, and 2020 Compliance) of the City's 2020 Plan discusses and provides the following:

- The Water Conservation Act of 2009 (or SB X7-7) required the State of California achieve a 20 percent reduction in urban water use by the year 2020.
- SB X7-7 required urban water suppliers, including the City, to develop a "2020 Water Use Target" to assist the State of California to achieve the 20 percent reduction. The 2020 Water Use Target represents the amount of water each person should use per day (i.e. gallons per capita per day or GPCD) by the year 2020.
- The City previously determined its 2020 Water Use Target during the preparation of its 2015 Plan by completing standardized tables (or the SB X7-7 Verification Form) to demonstrate compliance with the Water Conservation Act of 2009. The City's SB X7-7 Verification Form has not been modified and is included as part of this 2020 Plan as Appendix H. The City's 2020 Water Use Target is 196 GPCD.
- The City's 2020 Plan incorporates the 2020 Water Use Target and determines compliance based on actual water use.
- The population within the City's service area during Fiscal Year 2019-20 is estimated at 178,409. The City's population was estimated using the City's 2020 Water Master Plan Update. The 2020 Water Master Plan Update reviewed population data from the Southern California Association of Governments and land use data for residential, retail/service, mixed use, and public use areas to estimate the FY 2019-20 population with the City's municipal boundaries.
- The City's "gross water" use represents the total volume of water entering its distribution system from its water supply sources. The City's gross water use excludes recycled water deliveries or water conveyed to another supplier. The City's annual gross water during Fiscal Year 2019-20 was 32,109 AF.
- The City's per-capita water use is based on the gross water use divided by the population. The City's per-capita water use during Fiscal Year 2019-20 was 161 GPCD. The City's confirmed 2020 Water Use Target is 196 GPCD. The City's per-capita water use during Fiscal Year 2019-20 meets the 2020 Water Use Target.
- The City has also demonstrated compliance with the 2020 Water Use Target by completing the SB X7-7 2020 Compliance Form (provided in Appendix I).

5.1 GUIDANCE FOR WHOLESALE SUPPLIERS

CWC 10608.12.

(w) "Urban wholesale water supplier," means a water supplier, either publicly or privately owned, that provides more than 3,000 acre-feet of water annually at wholesale for potable municipal purposes.

The City is not a wholesale agency and is not required by DWR to complete Section 5.1.

5.2 SB X7-7 FORMS AND SUMMARY TABLES

The City previously calculated its "Baseline" water periods and a "2020 Water Use Target" in its 2015 Plan. There were two different Baseline periods identified (consisting of a "10-year Baseline" period and a "5-year Baseline" period). The average water use for each of these two Baseline periods, expressed in GPCD, represents the Baseline water use for each period. A 10-year Baseline period was identified by the City and information regarding the starting year, ending year, and average year water use rate during this period is provided in Table 5-1. The City determined its 2020 Water Use Target by calculating 80 percent of the 10-year Baseline water use.

According to Section 10608.22 of the California Water Code, if an urban retail water supplier's 5-year Baseline period water use is greater than 100 GPCD, the calculated 2020 Water Use Target may need to be reduced. A 5-year Baseline period was identified by the City and information regarding the starting year, ending year, and average water use rate during this period is provided in Table 5-1. The average water use rate during the identified 5-year Baseline period was greater than 100 GPCD. As a result, the 5-year Baseline period was used to determine if the 2020 Water Use Target required any adjustments.

The City's calculated 2020 Water Use Target was compared with the 95 percent of the average water use within the 5-year Baseline to determine if any adjustments were required. As shown in Table 5-2, no adjustments were required. The Baseline water uses were used to confirm the City's 2020 Water Use Target (which represents the per capita water use target for 2020 pursuant to SB X7-7).

5.2.1 SB X7-7 VERIFICATION FORM (BASELINES AND TARGETS)

The City's service area has not changed (i.e. expansion or contraction) since the 2015 Plan was prepared. The City's 2020 Plan incorporates the Baseline water uses and 2020 Water Use Target calculated in the 2015 Plan. The City previously prepared standardized tables (SB X7-7 Verification Form) to demonstrate compliance with the Water Conservation Act of 2009 in its 2015 Plan, including compliance with the City's 2015 Interim Water Use Target. The City's SB X7-7 Verification Form has not been modified and is included as part of this 2020 Plan as Appendix H.

5.2.2 SB X7-7 2020 COMPLIANCE FORM

The City's compliance with its 2020 Water Use Target is summarized in the following sections. The City has also demonstrated compliance with the 2020 Water Use Target by completing the SB X7-7 2020 Compliance Form (provided in Appendix I).

5.2.3 SUBMITTAL TABLES 5-1 AND 5-2

Summary information from the SB X7-7 Verification Form and from the SB X7-7 2020 Compliance Form is provided in Tables 5-1 and 5-2 below.

Table 5-1 Baselines and Targets Summary from SB X7-7 Verification Form

<table>

NOTES:				

5.2.4 REGIONAL UWMP/REGIONAL ALLIANCE

As discussed in Section 2.4, the City's 2020 Plan was not developed as part of a Regional Alliance. Information from the City's 2020 Plan is not required to be reported in a Regional Alliance report.

5.3 BASELINE AND TARGET CALCULATIONS FOR 2020 UWMPS

5.3.1 SUPPLIER SUBMITTED 2015 UWMP, NO CHANGE TO SERVICE AREA

The general requirements associated with determining the Baseline periods, Baseline water uses, and 2020 Water Use Target were previously provided by DWR. Based on the requirements, the City calculated the Baseline water uses and 2020 Water Use Target in its 2015 Plan. The City's service area has not changed (i.e. expansion or contraction) since the 2015 Plan was prepared. The City's 2020 Plan incorporates the Baseline water uses and 2020 Water Use Target calculated in the 2015 Plan. The City's SB X7-7 Verification Form is included in Appendix H.

As discussed in Section 5.2.1, the City prepared standardized tables (SB X7-7 Verification Form) to demonstrate compliance with the Water Conservation Act of 2009. The City's SB X7-7

Verification Form is provided in Appendix H and includes Baseline water uses and the 2020 Water Use Target. A summary of the Baseline water uses and 2020 Water Use Target is provided below.

The California Water Code allows an urban water supplier to calculate up to a 15-year Baseline period if at least 10 percent of its 2008 retail water demands were met through recycled water deliveries within its service area, otherwise calculation of a 10-year Baseline period is required. The City's recycled water deliveries were less than 10 percent of its retail water demands during FY 2007-08. Consequently, a 10-year Baseline period was identified by the City and information regarding the starting year, ending year, and average water use rate during this period is provided in Table 5-1. Water systems could potentially identify their 2020 Water Use Target by calculating 80 percent of the 10-year Baseline water use.

According to Section 10608.22 of the California Water Code, if an urban retail water supplier's 5-year Baseline period water use is greater than 100 GPCD, the calculated 2020 Water Use Target may need to be reduced. A 5-year Baseline period was identified by the City and information regarding the starting year, ending year, and average water use rate during this period is provided in Table 5-1. The average was use rate during the identified 5-year Baseline period was greater than 100 GPCD. As a result, the 5-year Baseline period was used to determine whether the 2020 Water Use Target required any adjustments.

The City's calculated 2020 Water Use Target was compared with the 95 percent of the average water use within the 5-year Baseline to determine whether any adjustments were required. The City's confirmed 2020 Water Use Target is 196 GPCD and is summarized in Table 5-1.

5.4 METHODS FOR CALCULATING POPULATION AND GROSS WATER USE

5.4.1 SERVICE AREA POPULATION

CWC 10608.20.

(e) An urban retail water supplier shall include in its urban water management plan due in 2010 pursuant to Part 2.6 (commencing with Section 10610) the baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.

(f) When calculating per capita values for the purposes of this chapter, an urban retail water supplier shall determine population using federal, state, and local population reports and projections.

CWC 10644.

(a)(2) The plan… shall include any standardized forms, tables, or displays specified by the department.

A discussion regarding the City's compliance with the 2020 Water Use Target is provided in Section 5.5. Compliance with the 2020 Water Use Target is based on the total estimated population within the City's water service during FY 2019-20. Because U.S. Census 2020 population data was not available during the preparation of the 2020 Plan, the City reviewed the methodologies recommended by DWR to estimate the FY 2019-20 population. The population methodology used by the City in the 2020 Plan is provided below.

The City initially reviewed the available historical populations within its service area for population growth trends. The City determined historical U.S. Census populations within its service area using DWR's Population Tool (https://wuedata.water.ca.gov/). The City's service area boundary was uploaded to DWR's Population Tool in a "KML" file format (i.e. Google Earth format). The KML file was originally created in a GIS shapefile format and converted into a KML format. The uploaded KML file represents the City's service area boundary from 1990 to present (2020). DWR's Population Tool utilized U.S. Census data from 1990, 2000, and 2010, along with the City's service area boundary, to estimate the population served by the City in the years 1990, 2000, and 2010.

The population within the City's service area in FY 2019-20 was estimated using data prepared in the City's 2020 Water Master Plan Update, which is a method allowed by DWR. The 2020 Water Master Plan Update reviewed population data from the Southern California Association of Governments and land use data for residential, retail/service, mixed use, and public use areas to estimate the FY 2019-20 population with the City's municipal boundaries. Based on Geographical Information Systems data, the area within the City's water service boundary is approximately 97.6 percent of the area within the City's municipal boundaries. The estimated population within the City's water service area for FY 2019-20 is 178,409 (or approximately 97.6 percent of the estimated FY 2019-20 population within the City's municipal boundaries) and is consistent with the historical population growth trends. The City's FY 2019-20 population is presented in Table 3 of the SB X7-7 2020 Compliance Form.

5.4.2 GROSS WATER USE

CWC 10608.12.

(h) "Gross water use" means the total volume of water, whether treated or untreated, entering the distribution system of an urban retail water supplier, excluding all of the following:

(1) Recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier.
(2) The net volume of water that the urban retail water supplier places into long-term storage.
(3) The volume of water the urban retail water supplier conveys for use by another urban water supplier.
(4) The volume of water delivered for agricultural use, except as otherwise provided in subdivision (f) of Section 10608.24.

California Code of Regulations Title 23 Division 2 Chapter 5.1 Article 1, Section 596.

(a) An urban retail water supplier that has a substantial percentage of industrial water use in its service area is eligible to exclude the process water use of existing industrial water customers from the calculation of its gross water use to avoid a disproportionate burden on another customer sector.

Gross water use represents the total volume of water entering a distribution system (but excludes recycled water deliveries, indirect potable use, water placed into long term storage, water conveyed to another supplier, water delivered for agricultural use, and process water if there is a substantial percentage used for industrial purposes) over a 12-month period. The City's annual gross water use amounts are based on the total amount of water entering the City's distribution system from its water supply sources (including groundwater production wells, purchased water, and purchased treated imported water). The annual gross water use by the City during FY 2019-20 was 32,109 AF.

The annual gross water use amounts within the City for each year of the Baseline periods (discussed in Section 5.6) are provided in SB X7-7 Verification Form, Table 4 (Appendix H). A further discussion of the Baseline periods is provided in Section 5.6.

The City currently does not use indirect recycled water within its service area. The City is not required by DWR to complete SB X7-7 Verification Form, Table 4-B.

Industrial process water is not subtracted from the City's gross water use provided in SB X7-7 Verification Form, Table 4. The City is not required by DWR to complete SB X7-7 Verification Form, Table 4-C.1, Table 4-C.2, Table 4-C.3, Table 4-C.4, and Table 4-D.

5.5 2020 COMPLIANCE DAILY PER CAPITA WATER USE (GPCD)

CWC 10608.12.

(f) "Compliance daily per capita water use" means the gross water use during the final year of the reporting period, reported in gallons per capita per day.

CWC 10608.20.

(e) An urban retail water supplier shall include in its urban water management plan due in 2010… compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.

As discussed in Section 5.4.2, the annual gross water use by the City during FY 2019-20 was 32,109 AF. As discussed in Section 5.4.1, the estimated population within the City's service area for FY 2019-20 is 178,409. As a result, the City's per-capita water use during FY 2019-20 was 161 GPCD. As discussed in Section 5.3.1, the City's confirmed 2020 Water Use Target is 196 GPCD. The City's per-capita water use during FY 2019-20 meets the 2020 Water Use Target and is in compliance. The City has also demonstrated compliance with the 2020 Water Use Target by completing the SB X7-7 2020 Compliance Form (provided in Appendix I).

5.5.1 2020 ADJUSTMENTS FOR FACTORS OUTSIDE OF SUPPLIER'S CONTROL

CWC 10608.24.

(d)(1) When determining compliance daily per capita water use, an urban retail water supplier may consider the following factors:

(A) Differences in evapotranspiration and rainfall in the baseline period compared to the compliance reporting period.

(B) Substantial changes to commercial or industrial water use resulting from increased business output and economic development that have occurred during the reporting period.

(C) Substantial changes to institutional water use resulting from fire suppression services or other extraordinary events, or from new or expanded operations, that have occurred during the reporting period.

(2) If the urban retail water supplier elects to adjust its estimate of compliance daily per capita water use due to one or more of the factors described in paragraph (1), it shall provide the basis for, and data supporting, the adjustment in the report required by Section 10608.40.

Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use, Methodology 4.

This section discusses adjustments to compliance-year GPCD because of changes in distribution area caused by mergers, annexation, and other scenarios that occur between the baseline and compliance years.

The City has determined its compliance with the 2020 Water Use Target without adjusting its annual gross water use during FY 2019-20.

5.5.2 SPECIAL SITUATIONS

The City's 2020 Plan incorporates the Baseline water uses and 2020 Water Use Target calculated in the 2015 Plan. There were no special situations that required the City to recalculate the Baseline water uses and 2020 Water Use Target.

5.5.3 IF SUPPLIER DOES NOT MEET 2020 TARGET

The City's per-capita water use during FY 2019-20 meets the 2020 Water Use Target and is in compliance.

5.6 REGIONAL ALLIANCE

As discussed in Section 2.4, the City's 2020 Plan was not developed as part of a Regional Alliance. Information from the City's 2020 Plan is not required to be reported in a Regional Alliance report.

Chapter 6

WATER SUPPLY CHARACTERIZATION

LAY DESCRIPTION – CHAPTER 6

WATER SUPPLY CHARACTERIZATION

Chapter 6 (Water Supply Characterization) of the City's 2020 Plan discusses and provides the following:

- The City's water supply sources include: groundwater pumped from the Chino Basin; treated groundwater from the Chino Basin produced by the Chino Basin Desalter Authority; imported water from Metropolitan Water District of Southern California treated and purchased through Water Facilities Authority; groundwater and/or surface water purchased from San Antonio Water Company; and recycled water purchased from Inland Empire Utilities Agency.
- The City's main source of water supply is groundwater pumped from the Chino Basin.
- A tabulation of the City's historical water supplies is provided in Section 6.1.
- A discussion regarding the City's imported water supplies from the Water Facilities Authority is provided. Information regarding imported water connections, capacities, reliability, and historical production is provided.
- A discussion regarding the City's purchased water supplies from San Antonio Water Company is provided. Information regarding purchased water connections, capacities, and historical production is provided.
- A discussion regarding the City's groundwater supplies from the Chino Basin is provided. Information regarding basin location, adjudication, management, water levels, water quality, water rights, and historical production is provided.
- A discussion regarding the City's recycled water supply is provided. The City's recycled water supplies are produced by Inland Empire Utilities Agency. The City uses recycled water for industrial processes, landscape irrigation, agricultural irrigation, and golf course irrigation.
- The City's proposed future projects to maximize its water supply resources are discussed.
- The City's "energy intensity" is discussed and represents the quantity of energy consumed, measured in kilowatt hours, divided by the volume of water, measured in acre-feet over a one-year period. The total energy intensity associated with the City's water management processes was estimated during FY 2019-20.

In this Chapter, the City will identify and describe each of its sources of water supply. In addition, the City will describe the following:

- Management of each water supply source;
- Current provisions of a basin adjudication or Groundwater Sustainability Plan (GSP), as applicable, pertaining to management of groundwater supplies;
- Measures the City is taking to develop potential new sources of water supply (as applicable); and
- Opportunities for exchanges and transfers on a long- or short-term basis.

The characterization of the City's water supply sources will account for the anticipated availability during a normal year, a single dry year, a five consecutive year drought, along with projections through FY 2044-45.

6.1 WATER SUPPLY ANALYSIS OVERVIEW

CWC 10631.

(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a), providing supporting and related information, including all of the following:

(1) A detailed discussion of anticipated supply availability under a normal water year, single dry year, and droughts lasting at least five years, as well as more frequent and severe periods of drought, as described in the drought risk assessment. For each source of water supply, consider any information pertinent to the reliability analysis conducted pursuant to Section 10635, including changes in supply due to climate change.

(2) When multiple sources of water supply are identified, a description of the management of each supply in correlation with the other identified supplies.

(3) For any planned sources of water supply, a description of the measures that are being undertaken to acquire and develop those water supplies.

CWC 10631.

(h) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (f). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (f).

The City's water supply sources include: groundwater pumped from the Chino Basin; treated groundwater from the Chino Basin produced by the Chino Basin Desalter Authority; treated, imported water purchased from MWD through Water Facilities Authority; groundwater and/or surface water purchased from San Antonio Water Company; and recycled water purchased from Inland Empire Utilities Agency. The City's main source of water supply is groundwater pumped from the Chino Basin. A tabulation of the City's historical water uses is provided below in Figure 2.

Figure 2 - Historical Water Use by Source

Fiscal Year	System Water Supply Sources (AF)						Total
	Potable Water					Recycled Water	
	Groundwater	Purchased Water			Subtotal		
	Chino Basin	Chino Basin Desalter Authority	Water Facilities Authority	San Antonio Water Company			
2010-11	18,938	5,176	9,824	0	33,938	5,743	39,681
2011-12	19,164	5,127	10,820	0	35,111	7,492	42,603
2012-13	20,801	4,793	10,243	0	35,837	6,894	42,730
2013-14	21,724	5,141	9,904	0	36,769	8,427	45,196
2014-15	17,425	4,827	10,703	172	33,128	8,098	41,226
2015-16	22,751	2,682	2,755	338	28,526	7,510	36,036
2016-17	24,672	3,069	2,327	171	30,238	8,351	38,589
2017-18	26,109	4,032	3,211	341	33,693	9,653	43,346
2018-19	19,604	5,724	5,737	403	31,467	7,511	38,978
2019-20	18,395	6,636	6,513	565	32,109	7,812	39,921

Source: Data provided by Ontario Municipal Utility Company

6.1.1 SPECIFIC ANALYSIS APPLICABLE TO ALL WATER SUPPLY SOURCES

The section below provides a discussion of the following information to the extent practical:

- The City's existing and planned sources of water supply are identified;
- Each source of supply is quantified in five-year increments through FY 2044-45;
- The anticipated supply availability under normal, single dry, and five consecutive dry years, and any other water year conditions included in the Drought Risk Assessment (see Chapter 7) are described;
- The management of each water supply in correlation with other identified supplies is described.
- Information pertinent to the reliability analysis, including climate change effects, is considered.

The City historically has relied on groundwater pumped from the Chino Basin; treated groundwater from the Chino Basin produced by the Chino Basin Desalter Authority; treated, imported water purchased from MWD through Water Facilities Authority; groundwater and/or surface water purchased from San Antonio Water Company; and recycled water purchased from Inland Empire Utilities Agency. The following descriptions summarize the City's sources of supply (detailed descriptions are provided in Section 6.2).

Existing and Planned Sources of Supply

Purchased Treated Imported Water

The City has historically purchased treated imported water from the Water Facilities Authority (from IEUA), as described in Section 6.2.1. In addition, Section 6.2.1 provides a detailed discussion of the existing and planned supply of the treated imported water, including a description of the management and reliability of those treated imported water supplies. Table 6-8 summarizes the actual treated imported water supply for FY 2019-20. Table 6-9 summarizes the projected water supply, in five-year increments, through FY 2044-45 under varying water supply conditions.

Groundwater

The City has historically pumped groundwater from the Chino Basin as described in Section 6.2.2. In addition, Section 6.2.2 provides a detailed discussion of the existing and planned supply of the groundwater, including a description of the management and reliability of those groundwater supplies. Table 6-8 summarizes the actual groundwater supplies for FY 2019-20. Table 6-9 summarizes the projected water supply, in five-year increments, through FY 2044-45 under varying water supply conditions.

Surface Water

The City does not use self-supplied surface water sources to meet its water demands. The City purchases treated surface water supplies from SAWCo.

Storm Water

The City has historically produced groundwater from the Chino Basin. Management and use of the stormwater runoff from the Chino Basin watershed is crucial to groundwater management. However, the City currently does not have its own program to beneficially use stormwater runoff as a direct source of supply.

Wastewater and Recycled Water

The City has historically purchased recycled water supplies from Inland Empire Utilities Agency as described in Section 6.2.5. In addition, Section 6.2.5 provides a detailed discussion of the existing and planned use of the recycled water, including a description of the management and reliability of those recycled water supplies. Table 6-8 summarizes the actual recycled water supplies for FY 2019-20. In addition, Table 6-9 summarizes the projected recycled water supply, in five-year increments, through FY 2044-45 under varying water supply conditions.

6.1.2 OTHER CHARACTERIZATION CONSIDERATIONS

A description of the City's water system along with a map of its service area is included in Chapter 3. In addition, the agencies which manage the water supplies used by the City are identified in Section 6.2.1 (imported water), 6.2.2 (groundwater), 6.2.3 (surface water), 6.2.4 (stormwater), and 6.2.5 (recycled water).

6.1.3 OPTIONAL PLANNING TOOL

As discussed in Section 4.2.5, DWR has created an optional "Planning Tool Worksheet" for water suppliers to review and assess monthly water use trends. DWR has deemed the tool as optional, and the City is not required by DWR to use the tool. Section 6.1 provides a tabulation of the City's historical annual water uses for each water supply source. During the past 10 years, the City experienced a five-consecutive-year-drought within its service area from FY 2011-12 to FY 2015-16. Historical records indicate the City's annual water demands had been greater prior to FY 2011-12. The City has been able to provide sufficient water supplies to its customers, including during long-term droughts and years with historically high water demands. In addition, the City has been able to provide water service to meet maximum day water demands for these years, including during the summer months. A further discussion regarding the reliability of the City's water supply sources is provided in Chapter 7.

6.2 NARRATIVE SECTIONS FOR SUPPLIER'S UWMP WATER SUPPLY CHARACTERIZATION

6.2.1 PURCHASED OR IMPORTED WATER

CHINO BASIN DESALTER AUTHORITY

The City purchases treated groundwater from the Chino Basin Desalter Authority (through the "*Amended and Restated Water Purchase Agreement, January 1, 2011*" contract between the City and CDA). On September 25, 2001, CDA was formed under a Joint Exercise of Powers Agreement (JPA) to remove salts from brackish groundwater extracted from the lower Chino Basin. The area which receives water supplies from CDA is 304 square miles. A further discussion of CDA's treatment facilities is provided in Section 6.2.2.

Treated water is distributed to CDA's member agencies which include the City of Chino, City of Chino Hills, City of Norco, City of Ontario, Inland Empire Utilities Agency, Jurupa Community Services District, Santa Ana River Water Company, and Western Municipal Water District. Western Municipal Water District joined the CDA member agencies in 2010. CDA's member agencies provide water service within Riverside County and San Bernardino County. The member agencies have contract entitlements to receive a total of 35,200 AFY of treated water from CDA[4]. The City has a contract entitlement to receive a total of 8,533 AFY of treated water from CDA. A further discussion of CDA's water supplies, and the management of these supplies in the Chino Basin, is provided in Section 6.2.2.

The City purchases treated groundwater supplies from CDA. The City's purchases over the past five years have been tabulated in Figure 2 above. Over the past five years, the City has purchased 2,682 AFY to 6,636 AFY, with an average of 4,429 AFY from CDA. The City's projected purchases from the CDA, over the next 25 years in five-year increments, is provided in Table 6-9.

WATER FACILITIES AUTHORITY

The City purchases treated, imported surface water from the Water Facilities Authority (through the "*Installment Purchase Agreement Relating to Water Facilities Authority Water Treatment Plant, October 1, 1985*" contract between the City and WFA). On February 19, 1980, WFA was formed under a Joint Exercise of Powers Agreement to acquire and construct facilities to supply and distribute potable water to its member agencies. WFA's service area is located within Chino Basin's boundaries at the western portion of San Bernardino county. WFA's member agencies include the Cities of Chino, Chino Hills, Ontario, Upland, and the Monte Vista Water District. The area which receives water supplies from WFA is approximately 148 square miles.

[4] https://www.chinodesalter.org/98/Member-Agencies

WFA purchases untreated imported water from Metropolitan Water District of Southern California through Inland Empire Utilities Agency. WFA owns and operates the Agua de Lejos Treatment Plant located in the City of Upland. The Agua de Lejos Treatment Plant is a conventional surface water treatment facility that treats and disinfects imported water supplies from the State Water Project delivered by MWD through IEUA. The Agua de Lejos Treatment Plant began operating in 1988 and has a treatment capacity of 81 million of gallons per day (MGD).

The City purchases treated, imported water supplies from the Water Facilities Authority. The City's purchases over the past five years has been tabulated in Section 6.1. Over the past five years, the City has purchased 2,327 AFY to 6,513 AFY, with an average of 4,109 AFY from WFA. The City's projected purchases from the WFA, over the next 25 years in five-year increments, are provided in Table 6-9.

The City's treated imported water supplies from MWD, through WFA, may be impacted during a multi-year drought or other conditions which limits MWD from delivering sufficient water supplies to all of its member agencies, and consequently to the City. In anticipation of such a reduction in supplies, MWD developed a Water Supply Allocation Plan (WSAP) which is briefly described below. The WSAP provides a means of equitably providing reduced water supplies to each of MWD's member agencies for up to 10 levels of reduction representing up to a 50 percent reduction.

During calendar year 2007, critically dry conditions impacted MWD's water supply sources. In addition, a ruling in the Federal Courts in August 2007 provided protective measures for the Delta Smelt (and subsequently other aquatic species) in the Sacramento-San Joaquin River Delta resulting in restrictions on the availability of State Water Project water. As a result, MWD adopted a WSAP in February 2008 to allocate available water supplies to its member agencies. MWD revised the WSAP in December 2014.

The WSAP establishes ten different shortage levels and a corresponding Allocation to each member agency. Based on the shortage levels established by MWD, the WSAP provides a separate reduced Allocation to a member agency for its 1) Municipal and Industrial (M&I) retail demand and 2) replenishment demand. The WSAP formula considers historical local water production, full service treated water deliveries, agricultural deliveries and water conservation efforts when calculating each member agency's Allocation.

In general, the WSAP process calculates total historical member agency demand. That historical demand is then compared to member agency projected local supply for a specific Allocation year. The balance required from MWD, less an Allocation reduction factor, is the member agency's "Water Supply Allocation" of imported water from MWD. When a member agency reduces its local demand through conservation or other means, the Allocation of imported water will increase. Depending on MWD's available supply, MWD can establish a specific WSAP shortage level. The shortage level causes a regional reduction and calculates an allocation for each of its member agency. Additional information about MWD's WSAP is provided in MWD's Regional 2020 UWMP which is incorporated by reference. The following is a summary of MWD's water shortage levels:

Level 1 – Regional Percent Reduction of 5%
Level 2 – Regional Percent Reduction of 10%
Level 3 – Regional Percent Reduction of 15%
Level 4 – Regional Percent Reduction of 20%
Level 5 – Regional Percent Reduction of 25%
Level 6 – Regional Percent Reduction of 30%
Level 7 – Regional Percent Reduction of 35%
Level 8 – Regional Percent Reduction of 40%
Level 9 – Regional Percent Reduction of 45%
Level 10 – Regional Percent Reduction of 50%

In response to a fourth consecutive year of below average rainfall and critically dry conditions, MWD declared a WSAP Allocation Level 3 for FY 2015-16, which represented a regional reduction of 15 percent. MWD rescinded the WSAP for FY 2016-17 and has not reinstated the WSAP since that time.

SAN ANTONIO WATER COMPANY

The City purchases water from SAWCo (through the "*Water Service Agreement, January 1, 2017*" contract between the City and SAWCo) which delivers domestic and irrigation water to a variety of shareholders. These shareholders include most residents of San Antonio Heights (an unincorporated area of San Bernardino County), the Cities of Upland and Ontario, Monte Vista Water District, the United States Forest Service, the San Bernardino County Flood Control District, local golf courses, rock quarries, and grove irrigators. SAWCo is governed by a seven-member Board of Directors that is elected by shareholders at the end of each calendar year.

Pursuant to SAWCo's "*Approved FY 2020 Budget Report*[5]", there are 6,178 Active Shares and a total of 6,389 Company Shares (Inactive Shares are those shares currently not utilizing entitlement water). In 2020, each Active Share was equal to 2.035 AF of entitlement water from SAWCo, making the total active share entitlement 12,570 AF. The City of Upland is the largest shareholder with an entitlement of 9,186 AF and the domestic customers of San Antonio Heights as a group represent the second largest block of shareholders, with an entitlement of 1,269 AF. Monte Vista Water District has an entitlement of 671 AF and the City has an entitlement of 600 AF based on Active Share entitlements (volume per share is subject to change).

[5] https://www.sawaterco.com/2020-approved-budget

SAWCo's water supply sources include surface water obtained from the San Antonio Canyon, water from the San Antonio Tunnel, and groundwater sources from the Chino Basin, Six Basins, and Cucamonga Basin. The majority of SAWCo's water supplies are obtained from groundwater produced from the Cucamonga Basin and surface water from San Antonio Creek. A description regarding of the reliability of SAWCo's individual water supply sources is included in SAWCo's 2020 UWMP, which is incorporated by reference.

The City's purchase of treated water from SAWCo over the past five years has been tabulated in Section 6.1. Over the past five years, the City has purchased 171 AFY to 565 AFY, with an average of 364 AFY from SAWCo. The City's projected purchased water from SAWCo, over the next 25 years in five-year increments, is provided in Table 6-9.

6.2.2 GROUNDWATER

CWC 10631.

(b)(4) If groundwater is identified as an existing or planned source of water available to the supplier, all of the following information:

(A) The current version of any groundwater sustainability plan or alternative adopted pursuant to Part 2.74 (commencing with Section 10720), any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management for basins underlying the urban water supplier's service area.

(B) A description of any groundwater basin or basins from which the urban water supplier pumps groundwater. For basins that a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree. For a basin that has not been adjudicated, information as to whether the department has identified the basin as a high- or medium-priority basin in the most current official departmental bulletin that characterizes the condition of the groundwater basin, and a detailed description of the efforts being undertaken by the urban water supplier to coordinate with groundwater sustainability agencies or groundwater management agencies listed in subdivision (c) of Section 10723 to maintain or achieve sustainable groundwater conditions in accordance with a groundwater sustainability plan or alternative adopted pursuant to Part 2.74 (commencing with Section 10720).

(C) A detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(D) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

CHINO BASIN

Chino Basin - Sustainable Groundwater Management Act

The Chino Basin is a sub-basin of the Upper Santa Ana Valley Groundwater Basin pursuant to DWR Bulletin 118, Basin Number 8-2.01. Pursuant to the Sustainable Groundwater Management Act of 2014 (SGMA), the Chino Basin was named as an adjudicated groundwater basin and is exempt from the requirements of developing a GSP and subsequently was designated a very-low-priority basin in DWR's 2019 SGMA Basin Prioritization report. In compliance with SGMA, the Chino Basin Watermaster submits its Annual Report to DWR.

Chino Basin - Adjudication

The Chino Basin was adjudicated under the Chino Basin Judgment, entered on January 27, 1978 by the Superior Court for the County of San Bernardino. A copy of the Chino Basin Judgment is provided in Appendix J. The Chino Basin Watermaster was created by the Judgement to administer the provisions of the Judgement as an arm of the Court.

The Chino Basin Judgment originally established a Safe Yield for the Chino Basin of 140,000 AFY. Pursuant to the most recent Safe Yield reset effective in 2020, the Safe Yield in the Chino Basin is currently 131,000 AFY (July 1 to June 30, 2030). The Safe Yield is recalculated every 10 years and is defined in the Chino Basin Judgment as "the long-term average annual quantity of ground water (excluding replenishment of stored water but including return flow to the Basin from use of replenishment or stored water) which can be produced from the Chino Basin under conditions of a particular year without causing an undesirable result". The Chino Basin Judgment's allocation of the Safe Yield includes three separate Pools: (1) the "Overlying Agricultural Pool"; (2) the "Overlying Non-Agricultural Pool"; and (3) the "Appropriative Pool". The Operating Safe Yield (OSY) is defined as "The annual amount of groundwater which Watermaster shall determine, pursuant to criteria specified in Exhibit "I", can be produced from Chino Basin by the Appropriative Pool parties free of replenishment obligation under the physical solution herein."

The City is a member of both the Overlying Non-Agricultural Pool and the Appropriative Pool. The Judgment allocates a portion of the safe yield to the Overlying Non-Agricultural Pool and a portion of the OSY to the Appropriative Pool. Pursuant to the Judgment, the City has appropriative rights to 20.742 percent of the OSY allocated to the Appropriative Pool. The City has gained 53.338 percent of the Safe Yield assigned to the Overlying Non-Agricultural Pool.

As of July, 2020 the Safe Yield is allocated at 82,800 AFY to the Overlying Agricultural Pool, 7,366 AFY to the Overlying Non-Agricultural Pool, and 40,834 AFY to the Appropriative Pool. Per the Judgment, the City has appropriative rights to 20.742 percent of the OSY. With an OSY of 40,834 AF, the City's current appropriative right is approximately 8,470 AFY as of July 2020. The City has purchased and has rights to 3,921 AF of Overlying Non-Agricultural Pool water.

Appropriators who are Parties to the Chino Basin Judgment, are authorized to produce groundwater in excess of their rights. Appropriators pay assessments for groundwater produced in excess of their rights to the Chino Basin Watermaster. The assessments are used to purchase water to replenish the Chino Basin. The Chino Basin Watermaster purchases water from Metropolitan Water District of Southern California through Inland Empire Utilities Agency and/or Three Valleys Municipal Water District, on behalf of the Parties, to replenish the Chino Basin. Occasionally, Watermaster has purchased water from storage accounts from parties within the Chino Basin.

In addition to the water rights described above, the City of Ontario has rights to groundwater held in the Chino Basin as described below:

Land Use Conversion and Annual Early Transfers

The City gains rights to additional Chino Basin groundwater as a result of land use conversions from agricultural to non-agricultural uses. This is expected to increase from development of Ontario Ranch; the total of which is adjusted annually by the Watermaster. As of FY 19/20, the City receives 4,254 AFY from land use conversions.

The Chino Basin Watermaster reallocates the unused portion of the Chino Basin Safe Yield from the Overlying Agricultural Pool to the Appropriative Pool members as a supplement to the Appropriative Pool share of Operating Safe Yield rights in any year. These transfers are permanent if agricultural land has been converted to non-agricultural use, or temporary if agricultural pool extractions are less than their share of the Safe Yield. From FY 2000-01 to FY 2019-20, the annual quantity of the Agricultural Pool's share available for reallocation to Appropriative Pool members[6] ranged from 40,822 AF to 61,014 AF, with an annual average of approximately 50,457 AF. As Agricultural Pool production declines within the Chino Basin, the reallocation of water to the Appropriative Pool will increase.

Groundwater Recharge Credits

The City is entitled to water rights due to groundwater recharge with stormwater and recycled water in the Chino Basin. The credited amount is based on the volume recharged and therefore varies annually but is projected to increase over time. Stormwater recharge credit is assigned based on OSY percentage. Recycled water recharge credit is assigned based on wastewater contribution percentage. In FY 2018/2019, 2,544 AF of recycled water was recharged for the City. In FY

[6] Pursuant to the Chino Basin Watermaster "*Fiscal Year 2019-20, 43rd Annual Report*", Appendix G

19/20, no recharge credits were purchased by the City due to limitations on groundwater storage capacity.

Fontana Recycled Water Rights

The City has a long-term contract to purchase up to 3,000 AFY of recharged recycled water rights from the City of Fontana. The City of Fontana does not operate a water system. The amount purchased by OMUC each year will vary. In FY 2018/2019, the City purchased 2,157 AF of Fontana's recycled water entitlement. In FY 19/20, no recharged water rights were purchased due to limitations on groundwater storage capacity.

Groundwater Storage Accounts

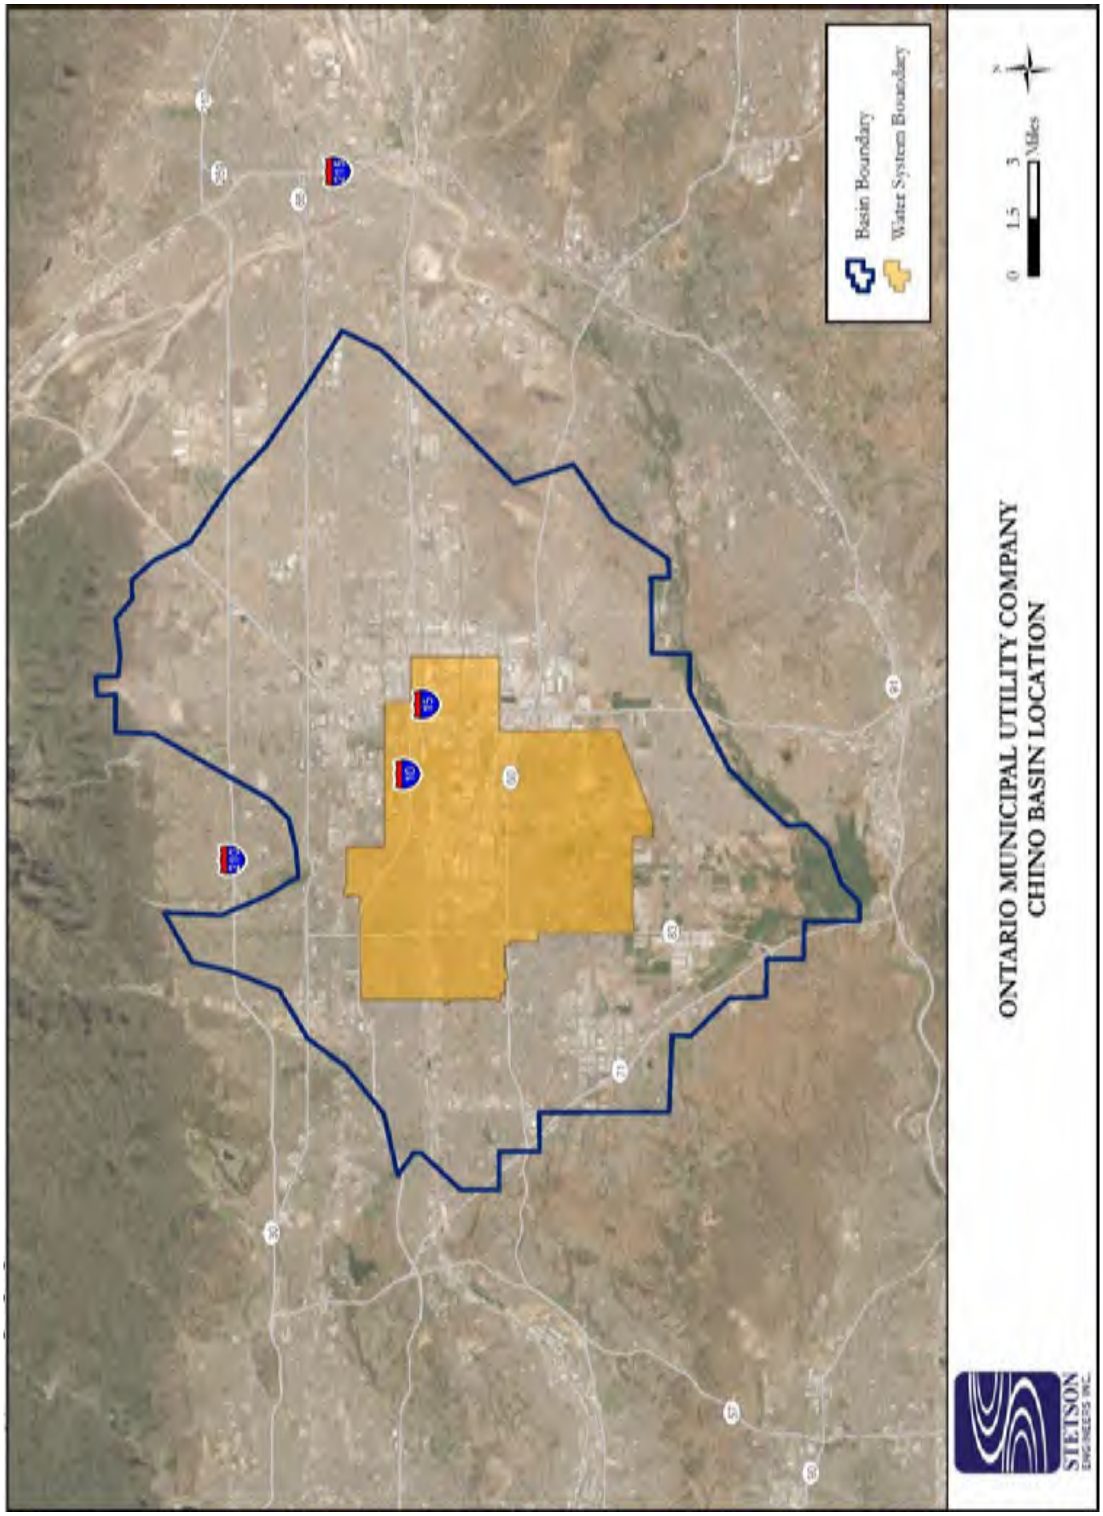
The City has rights to store water in the Chino Basin (Appropriative and Overlying Non-Agricultural) and has been increasing its various storage accounts in recent years. The City holds water in both local storage accounts and supplemental accounts. Local storage accounts hold un-pumped OSY groundwater rights and stormwater that has been recharged into the Chino Basin. Supplemental accounts hold both imported water and recycled water that has been recharged into the Chino Basin. As of June 30, 2020, the City has 96,544 AF in storage pursuant to Appropriative rights and 3,461 AF in storage pursuant to Overlying Non-Agricultural rights.

Chino Basin - Description

The Chino Basin is located within the Upper Santa Ana Valley, which is located in San Bernardino County and is bounded on the east by the Rialto-Colton fault; on the southeast by the contact with impermeable rocks forming the Jurupa Mountains; on the south by impermeable rocks of the Puente Hills and by the Chino fault; on the northwest by the San Jose fault; and on the north by the impermeable rocks of the San Gabriel Mountains and by the Cucamonga fault. The location of the Chino Basin is provided in Figure 3. The surface area of the Chino Basin is approximately 154,000 acres (or 240 square miles). The San Antonio Creek and Cucamonga Creek drain the Chino Basin area southward and flow into the Santa Ana River. Pursuant to DWR Bulletin 118 (for Basin Number 8-2.01), the total storage capacity of the Chino Basin is approximately 18,300,000 AF.

The water-bearing units in the Chino Basin includes Holocene and Upper Pleistocene alluvium. This Holocene alluvium consists mainly of alluvial-fan deposits, with maximum thickness of 150 feet that are coarsest in and near the mouths of the canyons and are finer away from canyon mouths in the southern part of the Chino Basin. The Pleistocene alluvium is exposed mainly in the northern part of the subbasin and supplies most of the water to wells located within the Chino Basin. The Pleistocene alluvium is about 600 to 700 feet thick throughout most of the Chino Basin. The alluvium contains interfingering finer, alluvial-fan deposits and coarser, fluvial deposits.

Figure 3 – Chino Basin Location



The Chino Basin is bounded by three major fault systems. Many of the faults within the Chino Basin form groundwater barriers marked by discontinuities in groundwater elevations. The Rialto-Colton fault forms the eastern boundary of the Chino Basin. Although it has no surface expression, it forms a major barrier to groundwater movement. The San Jose fault forms the northwest boundary of the Chino Basin. The Cucamonga fault zone forms part of the northern boundary of the Chino Basin. Displacement on the Cucamonga fault amounts to about 1,000 feet on its west end to 4,000 feet at its east end.

Chino Basin - Management

Basin Production

Over the past 20 years, total groundwater production from the Chino Basin has ranged from approximately 133,275 AFY to 188,910 AFY[7]. A majority of production currently is pumped for municipal and agricultural purposes while the remaining production is pumped by non-agricultural Parties.

Groundwater Level Monitoring

Groundwater elevation contours in the Chino Basin Watermaster's 2018 State of the Basin Report show a regional depression of groundwater surrounding the Chino-II Desalter well field and the eastern half of the Chino-I Desalter well field. Hydraulic Control of the Chino Basin is achieved east of Chino Desalter Well I-20. The contours also indicate groundwater flowing past the desalter wells west of Chino Desalter Well I-20, indicating only partial Hydraulic Control; however, losses are currently considered de minimis.

Chino Basin Desalter Authority

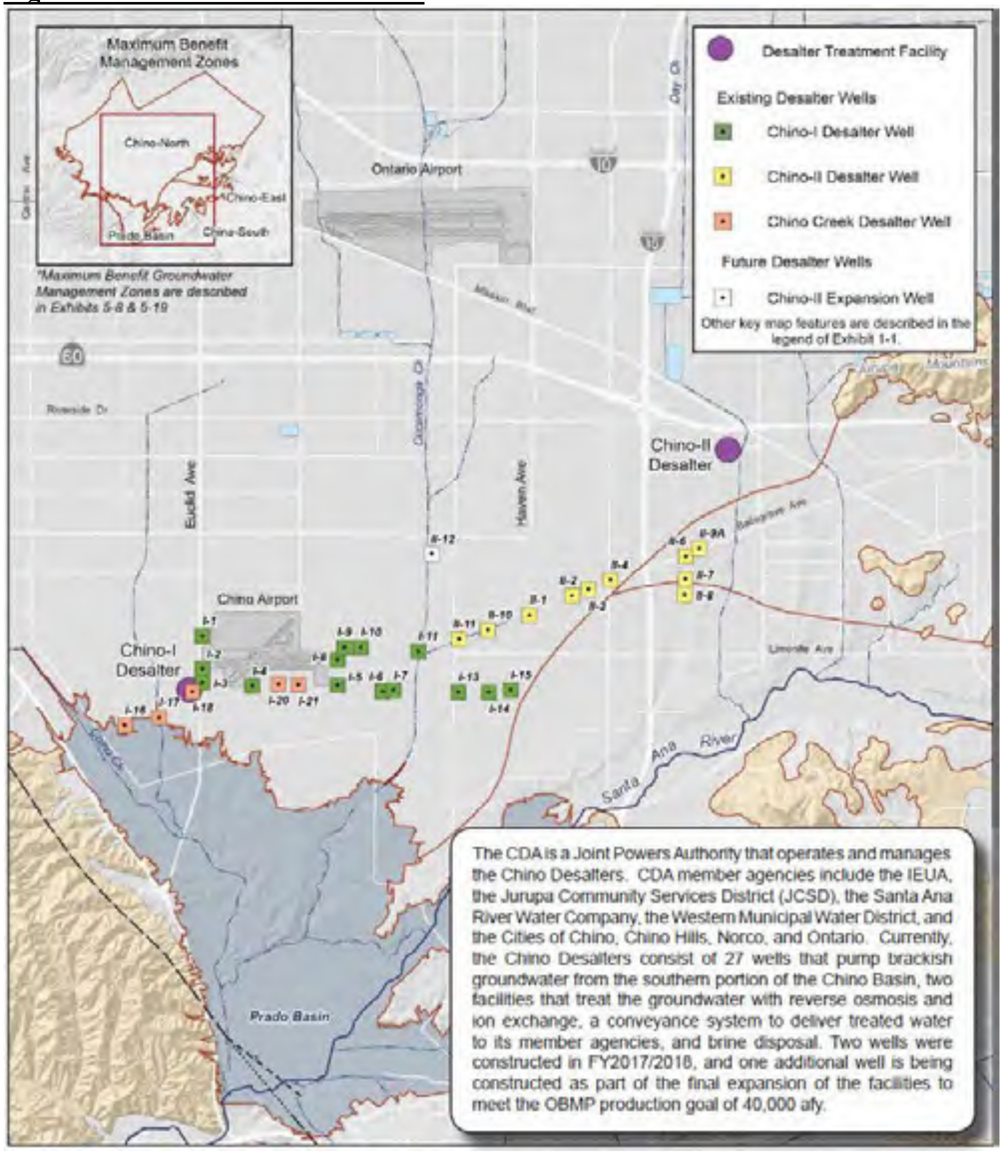
On September 25, 2001, the Chino Basin Desalter Authority was formed under a Joint Exercise of Powers Agreement to remove salts from brackish groundwater extracted from the lower Chino Basin. The area which receives water supplies from CDA is 304 square miles. A map showing CDA Desalter facilities and associated wells is provided in Figure 4 below.

CDA removes salts from brackish groundwater extracted from the lower Chino Basin through the Chino I and II Desalter facilities. The Chino I Desalter is located in the City of Chino and commenced operation in 2001 and was expanded in 2005 to have a total capacity of 14.2 MGD. The Chino I Desalter includes reverse osmosis, ion exchange, and air stripper treatment for treating brackish water and removing nitrate and volatile organic chemicals (VOCs). The Chino II Desalter is located in Jurupa Valley and began operation in 2006 and was expanded in 2011 and again in

[7] Pursuant to the Chino Basin Watermaster "*Fiscal Year 2019-20, 43rd Annual Report*", Appendix H http://www.cbwm.org/docs/annualrep/43rd%20Annual%20Report.pdf

2017 to have a total capacity of 33 MGD. The Chino II Desalter includes reverse osmosis and ion exchange treatment for treating brackish water and removing nitrate. Following the expansion, CDA constructed the Concentrate Reduction Facility in 2017, which utilizes chemical softening to remove the limiting foulants (specifically, calcium and silica) from the reverse osmosis concentrate. Additional components of the Chino II Desalter were constructed as part of the South Archibald Plume Project which will be operational in 2021, with the goal of removing and treated trichloroethylene (from groundwater wells impacted by the South Archibald Plume.

Figure 4 - Location of CDA Facilities



(source: Chino Basin Optimum Basin Management Program 2018 State of the Basin Report)

Treated water is distributed to CDA's member agencies which include the City of Chino, City of Chino Hills, City of Norco, City of Ontario, Inland Empire Utilities Agency, Jurupa Community Services District, Santa Ana River Water Company, and Western Municipal Water District through "take or pay" contracts. CDA's member agencies provide water service within Riverside County and San Bernardino County. CDA can produce up to 40,000 AF from the Chino Basin every year for the purpose of groundwater cleanup and control of contaminant migration. This production is fixed to achieve the desired groundwater cleanup goal. The member agencies have contract entitlements to receive a total of 35,200 AFY of treated water from CDA. The City's current contract entitlement is 8,533 AFY.

A portion of the production is in-lieu of those CDA member agencies producing an equal amount of groundwater from their own groundwater wells using their individual water rights. An additional portion of the production is temporarily assigned as "controlled overdraft". Pursuant to the Chino Basin Judgment, a total of 200,000 AF was authorized for controlled overdraft between the period of 1978 through 2017. In 2007, the Peace II Agreement was adopted to establish measures for achieving hydraulic control of the Chino Basin. One of the measures put forth included increasing the authorized controlled overdraft to 600,000 AF. This increase in controlled overdraft is separate from, and in addition to, the 200,000 AF authorized in the Chino Basin Judgment and is available for utilization until December 31, 2030. For the balance of the production, the Chino Basin Watermaster levies an annual Replenishment Assessment to purchase replenishment water to replace that overproduced water. Each of CDA's member agencies is responsible to pay a Replenishment Assessment for their purchases in excess of their respective water rights allocated to the program.

Chino Basin Optimum Basin Management Program

In 2000, the Chino Basin Watermaster developed the Chino Basin Optimum Basin Management Program (OBMP). The OBMP was developed in a collaborative process that identified the needs of the stakeholders, described the physical state of the basin, defined a set of management goals, identified impediments to these goals, and established a series of actions that would remove these impediments and achieve the management goals. The goals identified in the OBMP included: (1) Enhance Basin Water Supplied; (2) Protect and Enhance Water Quality; (3) Enhance Management of the Basin; and (4) Equitably Finance the OBMP.

The OBMP defines nine Program Elements which were incorporated into the OBMP Implementation Plan as part of the Court-ordered Peace Agreement (2000):

- Program Element 1 - Develop and Implement Comprehensive Monitoring Program
- Program Element 2 - Develop and Implement Comprehensive Recharge Program
- Program Element 3 - Develop and Implement a Water Supply Plan for Impaired Areas
- Program Element 4 - Develop and Implement Comprehensive Groundwater Management Plan for Management Zone 1

- Program Element 5 - Develop and Implement Regional Supplemental Water Program
- Program Element 6 - Develop and Implement Cooperative Programs with the Regional Board and Other Agencies to Improve Basin
- Program Element 7 - Develop and Implement Salt Management Plan
- Program Element 8 - Develop and Implement Groundwater Storage Management Program
- Program Element 9 - Develop and Implement Storage and Recovery Programs

The "Peace Agreement" (2000) and the "Peace II Agreement" (2007) are agreements among the Parties that allow the implementation of the OBMP and guides the management of the Chino Basin, including the construction and operations of the Desalters, hydraulic control of the Basin, groundwater production and replenishment for the Desalters, yield accounting and recharge.

Chino Basin Storage Management Plan

The Peace Agreement (2000) establishes rules and regulations, standard storage agreements, and related forms for storage in the Chino Basin. Since 2000, Chino Basin Watermaster administers groundwater storage in the Chino Basin pursuant to the storage management plan described in Program 8 of the 2000 OBMP and evaluated in the Programmatic Environmental Impact Report.

The three types of storage agreements resulted in five types of storage accounts: Excess Carryover, Local Supplemental-Recycled, Local Supplemental-Imported, Pre-2000 Quantified Supplemental, and Storage and Recovery. An Excess Carryover account includes a Party's unproduced rights in the Safe Yield and Basin Water purchased or transferred from other Parties. A Local Supplemental Water account includes any imported and/or recycled water that is recharged by a producer and similar water acquired from other Parties. A Storage and Recovery Account includes Supplemental Water and is intended to provide a broad and mutual benefit to the Parties of the Judgement. The Chino Basin Watermaster tracks the puts, takes, losses, and end-of-year storage totals for all storage accounts and reports on this accounting on an annual basis. The Chino Basin Watermaster assesses losses by considering water in managed storage (excluding Carryover) and offsets the increases in groundwater discharge to the Santa Ana River and from the Chino Basin attributable to managed storage (excluding Carryover). Chino Basin Watermaster also considers losses due to evaporation on the puts when water is recharged in spreading basins.

The individual Parties are involved in water transfers of annual unproduced rights in the Safe Yield and water in their storage accounts. Chino Basin Watermaster has an application and review process for these transfers. The Parties engage in conjunctive-use activities individually by storing Chino Basin and Supplemental Water that are in excess of their demands and recover that water as necessary. These activities collectively cause a temporary increase in the storage. The Parties' aggregate amount of water in managed storage was 541,845 AF as of June 30, 2020.

MWD's Dry-Year Yield Program is the only active storage and Recovery Program in Chino Basin. This program is a water exchange as discussed in 6.2.7.1. The DYYP can store up to 100,000 AF with maximum replenishment of 25,000 AFY and maximum extraction of 33,000 AFY. As of June 30, 2020, there was 45,961 AF within the DYYP account, resulting in a total managed storage volume of 587,806 AF (541,845 AF + 45,961 AF). The agreement that authorized the DYYP will expire in 2028. The combined volume of managed storage by MWD's DYYP and the Parties is projected to have a maximum of 790,000 AF in 2028, assuming DYYP has 100,000 AF in storage and that MWD removes the contract rate of 33,000 AFY starting in 2029.

As discussed in Section 4.5, Inland Empire Utilities Agency's "Addendum No. 2 to the Optimum Basin Management Program Project", completed in February 2021, amends the 2000 Chino Basin Peace Agreement's Programmatic Environmental Impact Report to address managed storage within the Chino Basin consistent with the Local Storage Limitation Solution. Consistent with Addendum No. 1, from July 1, 2017 through June 30, 2021 the Safe Storage Capacity of the Chino Basin is 600,000 AF. The LSLS proposes a change in the Safe Storage Capacity to 700,000 AF through June 30, 2030, and to 620,000 AFY from July 1, 2030 through June 30, 2035. Full utilization of the allowable increased storage space is expected to occur gradually as additional water is stored and less groundwater is produced. The Safe Storage Capacity of the Chino Basin will revert to 500,000 AF after June 30, 2035.

Groundwater Clean-up

Groundwater in areas of the Chino Basin is currently contaminated with Perchlorate and VOCs, including 1,2,3-Trichloropropane (1,2,3-TCP), trichloroethylene (TCE), and perchloroethylene (PCE). In addition, nitrates and TDS concentrations in areas of the Chino Basin exceed drinking water quality standards. Wellhead treatment is necessary in these areas to allow delivery of the groundwater for potable purposes.

Chino Basin - Historical and Projected Basin Production

The City currently produces groundwater from the Chino Basin. The City's share of the Operating Safe Yield is 20.742 percent; Ontario's current appropriative right is 8,470 AFY as of July 2020. In addition, the City has purchased and has rights to 3,921 AF of Overlying Non-Agricultural Pool water.

Over the past five years, the City has produced 18,395 AFY to 26,109 AFY, with an average of 22,306 AFY from the Chino Basin. The City's projected production from the Chino Basin, over the next 25 years in five-year increments, is provided in Table 6-9.

Table 6-1 Groundwater Volume Pumped

**** Units of measure (AF, CCF, MG)*** *must remain consistent throughout the UWMP as reported in Table 2-3.*						
NOTES:						

6.2.3 SURFACE WATER

The City does not use surface water supplies to meet its water demands.

6.2.4 STORMWATER

The City has historically received groundwater from the Chino Basin. Management and use of the stormwater runoff from the Chino Basin watershed, which is crucial to groundwater management. However, the City currently does not have its own program to beneficially use stormwater runoff as a direct source of supply.

6.2.5 WASTEWATER AND RECYCLED WATER

CWC 10633.

The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area, and shall include all of the following:

(a) A description of the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.

(b) A description of the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.

(c) A description of the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.

(d) A description and quantification of the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.

(e) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.

(f) A description of actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.

(g) A plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.

As a local water purveyor, the City delivers water to its customers from its potable and recycled water supplies. Table 6-4 summarizes current and projected recycled water use within the City from FY 2019-20 to FY 2044-45. The following sections provide a description of the City's current recycled water use and its plans to expand the use of recycled water as a source of water supply over the next 25 years.

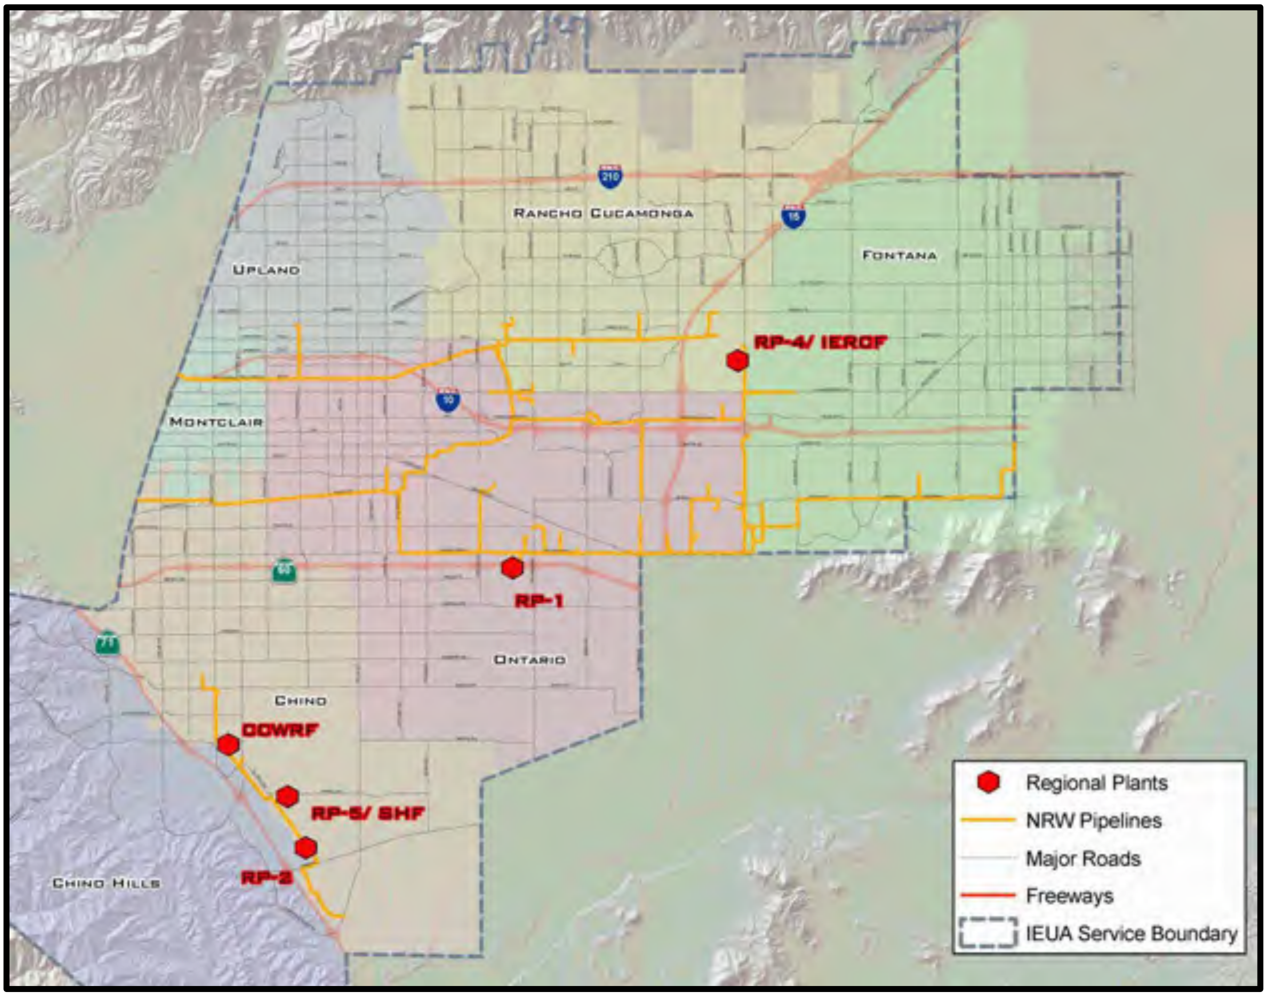
6.2.5.1 RECYCLED WATER COORDINATION

CWC 10633.

The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area…

The City's recycled water supplies are produced by IEUA. Pursuant to the Chino Basin Regional Sewage Service Contract, each Contracting Agency has the right of first purchase of their Base Entitlement. Base Entitlement is defined as the total quantity of sewage delivered into the Regional Sewerage System by the Contracting Agency less normal processing losses resulting from the treatment of sewage. IEUA owns and operates five regional wastewater treatment plants including the Regional Water Recycling Plant No. 1 (RP-1), Regional Water Recycling Plant No. 2 (RP-2), Regional Water Recycling Plant No. 4 (RP-4), Regional Water Recycling Plant No. 5 (RP-5), and Carbon Canyon Water Recycling Facility (CCWRF). RP-1 has a wastewater treatment capacity of 44 MGD; RP-2 does not have any liquid treatment processes and does not produce any recycled water; RP-4 has a wastewater treatment capacity of 14 MGD; RP-5 has a wastewater treatment capacity of 15 MGD; and CCWRF has a wastewater treatment capacity of approximately 9.5 MGD. IEUA is currently planning an expansion of RP-5 which will increase its hydraulic capacity up to 22.5 MGD. The locations of IEUA's regional plants are provided in Figure 5 below.

Figure 5 - Location of IEUA Regional Water Recycling Plants



Source: IEUA (https://www.ieua.org/everything-water/recycled-water/)

IEUA's regional plants (with the exception of RP-2 which does not have any liquid treatment processes) can produce tertiary-treated, Title 22-quality recycled water. Information regarding recycled water effluent monitoring data and compliance data is provided in IEUA's annual "*Recycled Water Quality Reports*" and "*Recycled Water Annual Reports*[8]"

Table 6-4 summarizes current and projected recycled water use within the City from FY 2019-20 to FY 2044-45. The City works closely with IEUA regarding the development of recycled water infrastructure in its service area and the identification of new recycled water users. As discussed in Section 2.6, the City has coordinated the preparation of its 2020 Plan with IEUA.

[8] https://www.ieua.org/read-our-reports/recycled-water-reports/

6.2.5.2 WASTEWATER COLLECTION, TREATMENT, AND DISPOSAL

CWC 10633.

(a) A description of the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.

Wastewater generated by the City is treated by IEUA. IEUA provides sewage utility services to seven contracting agencies including the Cities of Chino, Chino Hills, Fontana, Montclair, Ontario, Upland, and Cucamonga Valley Water District. Wastewater is collected within the City's local sewer collection system. The City's local sewers tie into IEUA's regional trunk sewers, including 90 miles of regional sewage interceptors. The regional sewer lines deliver wastewater to one or more regional plants owned by IEUA for treatment. IEUA owns and operates five regional water recycling plants including the Regional Water Recycling Plant No. 1, Regional Water Recycling Plant No. 2, Regional Water Recycling Plant No. 4, Regional Water Recycling Plant No. 5, and Carbon Canyon Water Recycling Facility. Wastewater is treated through various processes including preliminary screening, grit removal, primary clarification, secondary treatment, tertiary treatment, dechlorinating, solids thickening, anaerobic digestion, and dewatering. With the exception of RP-2, the regional plants can produce tertiary-treated, Title 22-quality recycled water.

IEUA operates a Non-Reclaimable Wastewater System (NRWS) which conveys high strength wastewater to treatment facilities in Los Angeles and Orange counties for eventual discharge to the Pacific Ocean. The NRWS consists of two trunk lines which convey wastewater to the Los Angeles County Sanitation Districts' sewer system, and one trunk line which conveys wastewater to the Orange County Sanitation District's sewer system. Treated wastewater is ultimately disinfected prior to being discharged to the Pacific Ocean. All water discharged to the ocean is monitored to ensure compliance with applicable local, state, and federal standards for discharge water

According to information provided by IEUA, IEUA treated approximately 49.1 MGD of wastewater at its regional plants during FY 2019-20. In addition, IEUA estimates that the total estimated amount of wastewater collected within the City's service area during FY 2019-20 was approximately 12,650 AFY), as shown in Table 6-2. As indicated in Table 6-2 and Table 6-3, the City's wastewater is treated at RP-1 and RP-5.

Table 6-2 Wastewater Collected Within Area in 2020

Submittal Table 6-2 Retail: Wastewater Collected Within Service Area in 2020

☐	There is no wastewater collection system. The supplier will not complete the table below.
100	Percentage of 2020 service area covered by wastewater collection system *(optional)*
100	Percentage of 2020 service area population covered by wastewater collection system *(optional)*

							Wastewater Treated	Discharged Treated Wastewater	Recycled Within Service Area	Recycled Outside of Service Area	Instream Flow Permit Requirement
RP-1	Santa Ana River	San Ana River		River or creek outfall	Yes	Tertiary	31,000	14,200	7,812	8,988	
						Total	31,000	14,200	7,812	8,988	0

[1] **Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.
[2] If the **Wastewater Discharge ID Number** is not available to the UWMP preparer, access the SWRCB CIWQS regulated facility website at https://ciwqs.waterboards.ca.gov/ciwqs/readOnly/CiwqsReportServlet?inCommand=reset&reportName=RegulatedFacility

NOTES: RP-1 are located within the City's service area; however; the water reclamation plant is wholly owned and operated by IEUA. Information regarding "2020 volumes" is estimated based IEUA's Recycled Water Annual Report FY 2019-20. Recycled water volume (within the serviced area) is for fiscal year 2019-20. Because the City does not own the water reclamation plant, information regarding "Instream Flow Permit Requirement" is not available and is not applicable.

6.2.5.3 RECYCLED WATER SYSTEM DESCRIPTION

CWC 10633.

(c) A description of the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.

The City's recycled water supplies are produced by IEUA. Pursuant to the Chino Basin Regional Sewage Service Contract, each Contracting Agency has the right of first purchase of their Base Entitlement. Base Entitlement is defined as the total quantity of sewage delivered into the Regional Sewerage System by the Contracting Agency less normal processing losses resulting from the treatment of sewage. The City has received recycled water from IEUA since 1972. The City uses recycled water for industrial, landscape irrigation, agricultural irrigation, and golf course irrigation. The recycled water pipelines operated and maintained by the City total approximately 173,000 feet. The pipelines range from 6-inch to 36-inch and consist of polyvinyl chloride and cement mortar lined and coated materials. The location of the City's recycled water distribution system is provided in Appendix K.

Identification of Agencies Involved in the Recycled Water System

As part of the Chino Basin Watermaster's development of the OBMP, recycled water use was identified as a critical component in drought-proofing and maintaining the region's economic growth. The OBMP established the path for the development of IEUA's regional recycled water distribution system and a Recycled Water Implementation Plan. IEUA in partnership with its member agencies and the Central Basin Watermaster have invested approximately $625 million since 2000 to increase the availability of local water supplies through water recycling, conservation, recharge improvements, the MWD groundwater storage and recovery project, the Chino Desalter, and other water management programs.

As previously discussed, IEUA owns and operates five regional wastewater treatment plants consisting of Regional Water Recycling Plant No. 1, Regional Water Recycling Plant No. 2, Regional Water Recycling Plant No. 4, Regional Water Recycling Plant No. 5, and Carbon Canyon Water Recycling Facility. IEUA began providing recycled water services in the 1970s at the Whispering Lakes Golf Course adjacent to RP-1 in the City Ontario and at the El Prado Park and Golf Course in the City of Chino. RP-2 does not have any liquid treatment processes and does not produce any recycled water. In the 1980s, IEUA expanded its recycled water system with the construction of the CCWRF and RP-4 recycling plants.

Those regional wastewater treatment plant capacities are:

- RP-1 has a wastewater treatment capacity of 44 MGD.
- RP-2 does not have any liquid treatment processes and does not produce any recycled water.
- RP-4 has a wastewater treatment capacity of 14 MGD.
- RP-5 has a wastewater treatment capacity of 15 MGD.
- CCWRF has a wastewater treatment capacity of approximately 9.5 MGD.

Information on Recycled Water System History and Operation

IEUA, in coordination with their member agencies, began providing recycled water services in the 1970s at the Whispering Lakes Golf Course adjacent to RP-1 in the City Ontario and at the El Prado Park and Golf Course in the City of Chino. In the 1980s, IEUA continued the implementation of its recycled water system with the construction of the CCWRF and RP-4 recycling plants. IEUA installed a backbone recycled water distribution system into the Cities of Chino and Chino Hills from the CCWRF in 1997. IEUA began groundwater recharge with recycled water at Ely Basin in 1999. In 2002, IEUA Board of Directors adopted Ordinance No. 75, the Mandatory Use Ordinance, to establish incentives and encourage recycled water use from the regional distributions system. A brief summary of recycled water project is provided below.

- In 2002, the Chino Basin Watermaster, Chino Basin Water Conservation District (CBWCD), San Bernardino County Flood Control District (SBCFCD) and IEUA combined efforts to greatly expand groundwater recharge capacity through the Chino Basin Facilities Improvement Program.

- In 2005, IEUA was permitted by the Regional Water Quality Control Board (RWQCB) to operate its recycled water groundwater recharge programs at six additional recharge sites (Banana, Hickory, Etiwanda Conservation Ponds, Declez, RP3, and Turner Basins).
- In 2007, IEUA was permitted to operate its recycled water groundwater recharge program at seven more recharge sites (Brooks, 8th Street, Victoria, Lower Day, San Sevaine, Etiwanda Spreading Grounds (later reconfigured as the Etiwanda Debris Basin) and Ely Basins).
- November 2007, IEUA and its member agencies unanimously adopted the Three-Year Recycled Water Business Plan. IEUA and its member agencies committed to implementing the plan, which laid out a focused and cost-effective approach to rapidly increase the availability and use of recycled water within IEUA's service area.
- Recycled water use within the IEUA service area increased from approximately 5,396 AF in FY 2004-05 up to 38,251 AF in FY 2013-14. However, with the conversion of land use from agricultural to urban, recycled water demand has decreased in recent years due to a reduction in irrigation demands.

6.2.5.4 POTENTIAL, CURRENT, AND PROJECTED RECYCLED WATER USES

CWC 10633.

(b) A description of the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use. A description of the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.

(d) A description and quantification of the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.

(e) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.

The City's "2020 Recycled Water Master Plan" identified potential recycled water customers within the City based on recycled water use for large-volume irrigation purposes (e.g. municipal parks, fields, golf courses, etc.). Recycled water use factors were applied to the ultimate land uses for these customers to determine the potential ultimate recycled water demands (see Appendix K).

The City uses recycled water for agricultural irrigation, landscape irrigation, golf course irrigation and industrial purposes. The City plans to increase recycled water use within its service area by expanding the recycled water system to additional parks, schools, nurseries, and commercial landscaping areas not currently using recycled water.

The City continues to retrofit landscape irrigation systems to use recycled water where available. Future recycled water use projections are based on current recycled water use and planned recycled water projects. As shown in Table 6-4, the current and projected deliveries reflect the volume of municipal recycled wastewater from IEUA to customers through the City's recycled water distribution system.

The City's recycled water supplies are produced by IEUA. Pursuant to the Chino Basin Regional Sewage Service Contract, each Contracting Agency has the right of first purchase of their Base Entitlement. Base Entitlement is defined as the total quantity of sewage delivered into the Regional Sewerage System by the Contracting Agency less normal processing losses resulting from the treatment of sewage. A tabulation of the City's recycled water demands over the past five years are provided in Section 6.1. Over the past five years, the City recycled water demands have ranged from 7,510 AFY to 9,653 AFY, with an average of 8,167 AFY. The City's actual use of recycled water in FY 2019-20 was 7,812 acre-feet and the 2015 Plan projected a recycled water use of 7,929 acre-feet for FY 2019-20, as shown in Table 6-5. The City's projected recycled water demands, over the next 25 years in five-year increments, are provided in Table 6-4 and Table 6-9.

Table 6-4 Current and Projected Recycled Water Direct Beneficial Uses Within Service Area

Submittal Table 6-4 Retail: Recycled Water Direct Beneficial Uses Within Service Area

☐ Recycled water is not used and is not planned for use within the service area of the supplier. The supplier will not complete the table below.

Name of Supplier Producing (Treating) the Recycled Water:	Inland Empire Utilities Agency
Name of Supplier Operating the Recycled Water Distribution System:	Ontario Municipal Utilities Company
Supplemental Water Added in 2020 (volume) *Include units*	0
Source of 2020 Supplemental Water	N/A

Beneficial Use Type *Insert additional rows if needed.*	**Potential** Beneficial Uses of Recycled Water (Describe)	Amount of **Potential** Uses of Recycled Water (Quantity) *Include volume units* [1]	General Description of 2020 Uses	Level of Treatment *Drop down list*	2020 [1]	2025 [1]	2030[1]	2035[1]	2040[1]	2045[1] (opt)

NOTE:

6.2.5.5 ACTIONS TO ENCOURAGE AND OPTIMIZE FUTURE RECYCLED WATER USE

CWC 10633.

The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area, and shall include all of the following:

(g) A plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.

The City plans to continue to increase delivery capacity and expand the recycled water system to serve additional customers. Because the City is reliant on imported water supplies from IEUA, the economic value of a recycled water system continues to increase. Any additional water supplies that can offset imported water purchases will make these projects more viable. As discussed previously, the City's "2020 Recycled Water Master Plan" identified potential recycled water customers within the City based on recycled water use for large-volume irrigation purposes (e.g. municipal parks, fields, golf courses, etc.). The City is evaluating the following potential methods to expand future recycled water use. These potential methods are tabulated in Table 6-6.

- As a retail water supplier, the City will offer its customers (with non-potable water demands) an economic incentive to convert its use to recycled water.
- The City's potable and recycled water rates are a combination of a Readiness-to-Serve Charge, which is based on meter size, and a Usage Charge, which is based on the amount of water use. The Readiness-to-Serve Charge for a recycled water meter is approximately 55 percent of the Readiness-to-Serve Charge for a potable water meter. The variable Usage Charge for recycled water is approximately 60% of the charge for potable water. (The City's current and future recycled water charges largely depend on the rate that IEUA sells the recycled water for.)
- The City's Municipal Code Sec. 6-8.715 Rates, fees, charges and deposits provides that "*Under certain circumstances, the City may contribute to the cost of designing and/or constructing the facilities needed to deliver recycled water to an applicant's property. Subject to the availability of funds, the City may:*
    (1) Reimburse an applicant for costs incurred to install oversized facilities in the public right-of-way
    (2) *Elect to participate in or construct pipelines, reservoirs, pumping stations or other facilities, as it determines necessary, and/or as funds are available.*
- The City's Municipal Code Sec. Section 6-8.703, Policy states "*It is the policy of the City that recycled water be used for any purposes approved for recycled water use, when it is economically, technically, and institutionally feasible. Recycled water shall be the primary*

source of supply for commercial and industrial uses, whenever available and/or feasible. Use of potable water for commercial and industrial uses shall be contrary to City policy; shall not be considered the most beneficial use of a natural resource; and shall be avoided to the maximum extent feasible."

- As a contracting agency of IEUA, the City will investigate the availability of financial assistance for plumbing retrofits necessary to receive recycled water.
- The City will evaluate the viability of making conversion to recycled water mandatory for those customers with non-potable supplies that are in proximity to an existing or planned recycled water pipeline.

Table 6-6 Methods to Expand Future Recycled Water Use

NOTES:			

6.2.6 DESALINATED WATER OPPORTUNITIES

CWC 10631.

(g) Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.

Chino Basin

As discussed in Section 6.2.2, the Central Basin Desalter Authority removes salts from brackish groundwater extracted from the lower Chino Basin through the Chino I and II Desalter facilities. The Chino I Desalter is located in the City of Chino and commenced operation in 2001 and was expanded in 2005 to have a total capacity of 14.2 MGD. The Chino I Desalter includes reverse osmosis, ion exchange, and air stripper treatment for treating brackish water and removing nitrate and VOCs. The Chino II Desalter is located in Jurupa Valley and began operation in 2006 and was expanded in 2011, and again in 2017 to have a total capacity of 33 MGD. The Chino II Desalter includes reverse osmosis and ion exchange treatment for treating brackish water and removing nitrate. Following the expansion, CDA constructed the Concentrate Reduction Facility in 2017, which utilizes chemical softening to remove the limiting foulants (specifically, calcium and silica) from the reverse osmosis concentrate. Additional components of the Chino II Desalter were constructed as part of the South Archibald Plume Project which will be operational in 2021, with the goal of removing and treated TCE from groundwater wells impacted by the South Archibald Plume.

Treated water is distributed to CDA's member agencies which include the City of Chino, City of Chino Hills, City of Norco, City of Ontario, Inland Empire Utilities Agency, Jurupa Community Services District, Santa Ana River Water Company, and Western Municipal Water District. The member agencies have contract entitlements to receive a total of 35,200 AFY of treated water from CDA. A portion of the production is in-lieu of those CDA member agencies producing an equal amount of groundwater from their own groundwater wells from the Chino Basin using their individual water rights.

6.2.7 WATER EXCHANGES AND TRANSFERS

CWC 10631.

(c) Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.

6.2.7.1 EXCHANGES

Pursuant to DWR's Final 2020 UWMP Guidebook, "*[w]ater exchanges are typically water delivered by one water user to another water user, with the receiving water user providing water in return at a specified time or when the conditions of the parties' agreement are met. Water exchanges can be strictly a return of water on a basis agreed upon by the participants or it can include payment and the return of water.*"

As discussed in Section 4.5, the City participates in MWD's Dry-Year Yield Program. The DYYP is a groundwater storage and recovery program where supplemental water is stored in the Chino Basin during surplus years and could be recovered in-lieu of imported water from MWD through IEUA. The DYYP allows maximum use of imported water supplies available during wet years and stored groundwater in the Chino Basin during dry years. The DYYP can store up to 100,000 AF with maximum replenishment of 25,000 AFY and maximum extraction of 33,000 AFY. During FY 2019-20, there was 45,961 AF within the DYYP account. The agreement that authorized the DYYP will expire in 2028.

The City authorized execution of an agreement with IEUA to participate in the DYY program in 2003. Participation obligates the City to reduce its use of imported water compared to the previous year by a fixed amount, known as the "shift obligation." The City's shift obligation is 8,076 AFY. During years when MWD calls for extraction, the City's WFA purchases would be reduced by 8,076 AFY compared to the previous year. Since Jurupa Community Services District does not have an imported water connection, it has entered into an agreement with the City for meeting its shift obligation. Under this agreement, Jurupa Community Services District conveys groundwater to the City in an amount equal to its shift obligation.

DYY funds were used for the construction of three groundwater wells (Wells 45, 46, and 47) and an ion-exchange facility located at John Galvin Park to treat water extracted from Well 44 and Well 52. When the City is required to extract MWD's stored water, MWD will pay for the operation and maintenance costs and the City would pay MWD (through IEUA) the full-service water rate. The City can use the DYY facilities to meet its normal water demands during other periods but is responsible for the cost of well operation and maintenance.

The program allows the City to be less reliant upon imported water supplies. The additional groundwater capacity allows the City to increase the percentage of groundwater supply used to meet peak demands.

6.2.7.2 TRANSFERS

Pursuant to DWR's Final 2020 UWMP Guidebook, "*[t]he Water Code defines a water transfer as a temporary or long-term change in the point of diversion, place of use, or purpose of use due to a transfer, sale, lease, or exchange of water or water rights.*"

Pursuant to the Chino Basin Peace Agreement (discussed in Section 4.5), transfers include the assignment, lease, or sale of a right to produce water to another producer within the Chino Basin or to another person or entity for use outside the basin whether the transfer is temporary or permanent. The leasing of water rights is also permissible. In addition, the Chino Basin Watermaster accounts for transfers of stored water between producers. The City can utilize the transfer opportunities available for Chino Basin water when necessary.

6.2.7.3 EMERGENCY INTERTIES

The City has emergency interties with other water agencies that service short-term emergency water supplies. Emergency interconnections are distribution system interconnections between water agencies for use during critical situations where one system or the other is temporarily unable to provide sufficient potable water to meet its water demands and/or fire protection needs. An emergency interconnection will allow a water system to continue serving water during critical situations such as local water supply shortages as a result of earthquakes, fires, prolonged power outages, and droughts.

The City has Mutual Aid Agreements with the following agencies: Chino, Chino Hills, Fontana, Monte Vista Water District, Cucamonga Valley Water District and IEUA.

The City also has several existing inter-agency and emergency interconnections with neighboring cities and water agencies. There are additional inter-agency and emergency interconnections planned as the City continues to expand. Currently, the City has two interconnections to WFA and five interconnections to CDA for imported water and can be utilized in times of emergency. Additionally, the City has one interconnection with Cucamonga Valley Water District and one interconnection with the City of Chino. The connection size between the City and Cucamonga Valley Water District is 4 inches and 8 inches through a Pressure Reducing Station. The interconnection size between the City and the City of Chino is 10 inches and the interconnection is located at the City of Chino Reservoir. These interconnections provide reliable water supply, in the event of a catastrophic supply interruption, from multiple sources of supply.

6.2.8 FUTURE WATER PROJECTS

CWC 10631.

(f) Include a description of all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water use, as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in normal and single-dry water years and for a period of drought lasting five consecutive water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.

The City's water supply sources include: groundwater pumped from the Chino Basin; treated groundwater from the Chino Basin produced by the Chino Basin Desalter Authority; treated, imported water purchased from MWD through Water Facilities Authority; groundwater and/or surface water purchased from San Antonio Water Company; and recycled water purchased from Inland Empire Utilities Agency. These water supply sources will allow the City to provide sufficient water service in the present moment, and in the future. Although the City has no plans for future water supply projects, the City will construct new groundwater production wells to replace existing wells when necessary.

Table 6-7 Expected Future Water Supply Projects or Programs

Submittal Table 6-7 Retail: Expected Future Water Supply Projects or Programs						
☑	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.					
☐	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.					
	Provide page location of narrative in the UWMP

	Drop Down List (y/n)	*If Yes, Supplier Name*				
Add additional rows as needed						
***Units of measure (AF, CCF, MG)** *must remain consistent throughout the UWMP as reported in Table 2-3.*						
NOTES:						

6.2.9 SUMMARY OF EXISTING AND PLANNED SOURCES OF WATER

CWC 10631.

(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a), providing supporting and related information, including all of the following…

(b)(2) When multiple sources of water supply are identified, a description of the management of each supply in correlation with the other identified supplies.

(h) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (f). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (f).

6.2.9.1 DESCRIPTION OF SUPPLIES

As discussed in Section 6.2, the City's water supply sources consist of purchased groundwater treated by CDA (see Section 6.2.1), treated imported water purchased from WFA (see Section 6.2.1), treated groundwater and/or surface water from SAWCo (see Section 6.2.1), groundwater from the Chino Basin (see Section 6.2.2), and recycled water from IEUA (see Section 6.2.5). The actual quantities of the water supply sources available to the City during FY 2019-20 are summarized in Table 6-8. The reliable quantities of projected water supply sources available to the City in five-year increments through FY 2044-45 during normal or average years are summarized in Table 6-9. The reliability of these sources of supply are addressed in Section 7.2.3, including during normal years, single dry years, and five consecutive year droughts.

The order of use of the City's projected reliable water supplies from FY 2019-20 through FY 2044-45 in five-year increments is based on historical practices, water supply availability, and the cost of water. It is anticipated the City will initially use groundwater produced from the Chino Basin. At the same time the City will continue to use recycled water for non-potable demands. The City will then use purchased treated water from CDA and SAWCo, to the extent it is available. The City will also use treated imported water. It is important to note that the Chino Basin is adjudicated (as discussed in Section 6.2.2) and that there is no limit to the amount of groundwater which can be produced annually. Consequently, in the event purchased treated water supplies from CDA and SAWCo and/or treated imported water may be limited, the City has the flexibility to increase groundwater production from the Chino Basin.

6.2.9.2 QUANTIFICATION OF SUPPLIES

The actual quantities of the water supply sources available to the City during FY 2019-20 are summarized in Table 6-8. The reliable quantities of projected water supply sources available to the City in five-year increments through FY 2044-45 during average years are summarized in Table 6-9. The reliability of these sources of supply are addressed in Section 7.2.3, including during normal years, single dry years, and five consecutive year droughts.

The City's projected quantities of purchased treated water supplies from CDA and SAWCo are based on historical long-term averages and available supplies during previous dry year conditions. The City's projected quantities of recycled water supplies to meet non-potable demands are based on historical long-term averages. The City's projected quantities of treated imported water and groundwater supplies from the Chino Basin are based on meeting the remainder of the City's total water demands. As noted above, in the event purchased treated water and/or treated imported water may be limited, the City has the flexibility to increase groundwater production from the Chino Basin. Consequently, it is anticipated the City will have sufficient water supplies available to meet projected demands.

NOTES:											

6.2.10 SPECIAL CONDITIONS

The City considered the issues described below when developing its planned sources of water supply.

6.2.10.1 CLIMATE CHANGE EFFECTS

Climate Change has the possibility of impacting the availability of planned water supplies, particularly during a drought period. Section 4.5 of this Plan provides a discussion regarding climate change effects on the City's various sources of supply.

6.2.10.2 REGULATORY CONDITIONS AND PROJECT DEVELOPMENT

The City has considered the implications of changing regulatory conditions and project development on the availability of planned water supplies. Section 1.4 provides a discussion the reduced reliance on Delta water supplies.

6.2.10.3 OTHER LOCALLY APPLICABLE CRITERIA

There are no locally applicable criteria which applies to the City.

6.3 SUBMITTAL TABLES COMPLETION USING THE OPTIONAL PLANNING TOOL

As discussed in Section 4.2.5, DWR has created an optional "Planning Tool Worksheet" for water suppliers to review and assess monthly water use trends. DWR has deemed the tool as optional and the City is not required by DWR to use the tool. Section 6.1 provides a tabulation of the City's historical annual water uses for each water supply source. During the past 10 years, the City experienced a five-consecutive-year-drought within its service area from FY 2011-12 to FY 2015-16. Historical records indicate the City's annual water demands had been greater prior to FY 2011-12. The City has been able to provide sufficient water supplies to its customers, including during long-term droughts and years with historically high water demands. In addition, the City has been able to provide water service to meet maximum day water demands for these years, including during the summer months. A further discussion regarding the reliability of the City's water supply sources is provided in Chapter 7.

6.4 ENERGY USE

CWC 10631.2.

(a) In addition to the requirements of Section 10631, an urban water management plan shall include any of the following information that the urban water supplier can readily obtain:

(1) An estimate of the amount of energy used to extract or divert water supplies.

(2) An estimate of the amount of energy used to convey water supplies to the water treatment plants or distribution systems.

(3) An estimate of the amount of energy used to treat water supplies.

(4) An estimate of the amount of energy used to distribute water supplies through its distribution systems.

(5) An estimate of the amount of energy used for treated water supplies in comparison to the amount used for nontreated water supplies.

(6) An estimate of the amount of energy used to place water into or withdraw from storage.

(7) Any other energy-related information the urban water supplier deems appropriate.

Pursuant to DWR's Final 2020 UWMP Guidebook "Energy intensity" is defined as the quantity of energy consumed or generated divided by volume of water entering a water management process. The energy intensity can be calculated based on the quantity of energy consumed, measured in kilowatt hours (kWh), divided by the volume of water, measured in AF for a water management process over a one-year period. The information used to calculate the estimated energy intensity associated with the City's water system is provided below. The energy intensity information is based on readily obtainable energy and water use data for the following water management processes: 1) extraction or diversion of water supplies; 2) placement into storage; 3) conveyance to distribution; 4) treatment; and 5) water system distribution.

The City has tabulated its energy intensity using readily obtainable energy consumption data obtained from monthly electricity bills from Southern California Edison (SCE) for the whole water system and the corresponding water use data obtained from available water meter readings. The City has reported the energy intensity associated with the water management processes which occur within its operational control. Because the City does not track individual energy usage for each water management process identified above, the City has estimated the energy intensity using the a “total utility approach” (i.e. sum of all water management processes). The total energy consumed was approximately 18,152,675 kWh during FY 2019-20.

The total volume of water entering the potable water system was approximately 32,109 AF during FY 2019-20 and is consistent with the total volume of water provided in Table 4-1 (less recycled water supplies).

The total energy intensity associated with the City’s water management processes is estimated at 565 kWh/AF. The energy intensity data and calculations based on the “total utility approach” are provided in Table O-1B below.

The City’s water management processes do not include “consequential hydropower generation” where the energy generation is a direct consequence of water delivery (i.e. all water passing through the energy generation devices is delivered to users). The City’s water management processes do not include “non-consequential hydropower generation” where the energy generation is not a direct consequence of water delivery (i.e. energy could be generated even if no water was being delivered to water users). In addition, the City’s water management processes do not include any substantial “self-generated energy sources” including solar, wind, geothermal, biomass, co-generation, and diesel generator sources.

Energy Intensity (kWh/volume)		*565.3*	*0.0*	*565.3*

Quantity of Self-Generated Renewable Energy

0 kWh

Data Quality *(Estimate, Metered Data, Combination of Estimates and Metered Data)*

Combination of Estimates and Metered Data

Data Quality Narrative:

The total energy consumed was identified based on Southern California Edison (SCE) billing records. The total energy consumed excludes electricity usage for general administration (which is not an identified water management process).

Narrative:

The total energy consumption includes energy associated with operating groundwater production wells and booster pumps to deliver water in the distribution system. Energy consumption is associated with operating groundwater treatment. Energy consumption is also associated with plant lighting and air conditioning, and operating the Supervisory Control and Data Acquisition (SCADA) system and chlorination injection pumps.

Chapter 7

WATER SERVICE RELIABILITY AND DROUGHT RISK ASSESSMENT

LAY DESCRIPTION – CHAPTER 7

WATER SERVICE RELIABILITY AND DROUGHT RISK ASSESSMENT

Chapter 7 (Water Service Reliability and Drought Risk Assessment) of the City's 2020 Plan discusses and provides the following:

- FY 2019-20 represents an "average" or "normal" water year for the City in which the total amount of rainfall was similar to the historical average rainfall.
- A "single dry" year for the City was represented in FY 2017-18, in which the total amount of rainfall was below the historical average rainfall.
- A "five consecutive year drought" period for the City is represented from FY 2011-12 to FY 2015-16, where the total amount of rainfall during each of these years was less than the historical average rainfall.
- The City's current and projected water supplies available during normal years in five-year increments over the next 25 years are provided (through Fiscal Year 2044-45) as shown on Table 7-2.
- The City's current and projected water supplies available during single dry years in five-year increments over the next 25 years are provided (through Fiscal Year 2044-45) as shown on Table 7-3.
- The City's current and projected water supplies available during each year of a five consecutive year drought in five-year increments over the next 25 years are provided (through Fiscal Year 2044-45) as shown on Table 7-4.
- The reliability of the City's water supply sources, including a review of water supply constraints, is provided. A single dry year or a five consecutive year drought period will not compromise the City's ability to provide a reliable supply of water to its customers.
- A Drought Risk Assessment is provided which includes an assessment of the City's water supply reliability over a five-year consecutive drought period. The City's DRA assumes a five-year consecutive drought from FY 2020-21 through FY 2024-25 and includes a review of water supplies, water uses, and water supply reliability for each water supply source during this period. The City's water system has experienced a prior five consecutive year drought with no limitation to its collective water supplies. However, the cost of those water supplies may have increased based on the mix of water supplies which are used. Consequently, the City has the ability to enact varying water shortage levels (see Chapter 8) to help educate its customers and provide an economic incentive for the retail customers to reduce their water consumption.

7.1 INTRODUCTION

This section of the City's UWMP describes the City's ability to meet retail customer water demands by analyzing a variety of factors which affect the City's water supply. This section assesses the City's water service reliability during average years, single dry years, and during a five consecutive year drought period to meet the water needs of its customers. This section also includes the discussion of a DRA which provides a mechanism for the City to evaluate the risk to its water supply under a drought lasting for the next five consecutive years.

7.2 WATER SERVICE RELIABILITY ASSESSMENT

CWC 10635.

(a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the long-term total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and a drought lasting five consecutive water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.

Information regarding the reliability of the City's water supplies is based on the historical precipitation data in the Chino Basin area. Historical annual precipitation in the Chino Basin area is discussed in Section 3.3 and is based on historical data collected from the National Oceanic and Atmospheric Administration (Ontario International Airport). Furthermore, Section 4.5 of this Plan notes that potential future climate change impacts may result in an increase in the average annual precipitation within the City's service area, thus indicating use of historical data is a reasonable and conservative approach. As indicated in Section 3.3, the historical average rainfall in the vicinity of the City's service area is 10.68 inches. FY 2019-20 represents an average or normal water year for the City in which the total amount of rainfall was similar to the historical average rainfall. A single dry year for the City was represented in FY 2017-18, in which the total amount of rainfall was below the historical average rainfall. A five consecutive year drought period for the City is represented from FY 2011-12 to FY 2015-16, where the total amount of rainfall during each of these years was less than the historical average rainfall. Table 7-1 summarizes these "base years" for average, single dry, and five consecutive year drought and provides the total amount of water supplies available to the City during those base years. The following discussion assesses the water service reliability of the City's water supply sources.

Water Service Reliability - Imported Water

The City's treated imported water supplies from MWD, through WFA (also IEUA, but this is untreated), may be impacted during a multi-year drought or other conditions which limits MWD from delivering sufficient water supplies to all of its member agencies, and consequently to the

City. In anticipation of such a reduction in supplies, MWD developed a WSAP which is briefly described below. The WSAP provides a means of equitably providing reduced water supplies to each of MWD's member agencies for up to 10 levels of reduction representing up to a 50 percent reduction.

During calendar year 2007, critically dry conditions impacted MWD's water supply sources. In addition, a ruling in the Federal Courts in August 2007 provided protective measures for the Delta Smelt (and subsequently other aquatic species) in the Sacramento-San Joaquin River Delta resulting in restrictions on the availability of State Water Project water. As a result, MWD adopted a WSAP in February 2008 to allocate available water supplies to its member agencies. MWD revised the WSAP in December 2014.

The WSAP establishes ten different shortage levels and a corresponding Allocation to each member agency. Based on the shortage levels established by MWD, the WSAP provides a separate reduced Allocation to a member agency for its 1) Municipal and Industrial retail demand and 2) replenishment demand. The WSAP formula considers historical local water production, full service treated water deliveries, agricultural deliveries and water conservation efforts when calculating each member agency's Allocation.

In general, the WSAP process calculates total historical member agency demand. That historical demand is then compared to member agency projected local supply for a specific Allocation year. The balance required from MWD, less an Allocation reduction factor, is the member agency's "Water Supply Allocation" of imported water from MWD. When a member agency reduces its local demand through conservation or other means, the Allocation of imported water will increase. Depending on MWD's available supply, MWD can establish a specific WSAP shortage level. The shortage level causes a regional reduction and calculates an allocation for each of its member agency. Additional information about MWD's WSAP is provided in MWD's Regional 2020 UWMP which is incorporated by reference. The following is a summary of MWD's water shortage levels:

Level 1 – Regional Percent Reduction of 5%
Level 2 – Regional Percent Reduction of 10%
Level 3 – Regional Percent Reduction of 15%
Level 4 – Regional Percent Reduction of 20%
Level 5 – Regional Percent Reduction of 25%
Level 6 – Regional Percent Reduction of 30%
Level 7 – Regional Percent Reduction of 35%
Level 8 – Regional Percent Reduction of 40%
Level 9 – Regional Percent Reduction of 45%
Level 10 – Regional Percent Reduction of 50%

In response to a fourth consecutive year of below average rainfall and critically dry conditions, MWD declared a WSAP Allocation Level 3 for fiscal year 2015-16, which represented a regional reduction of 15 percent. MWD rescinded the WSAP for fiscal year 2016-17 and has not reinstated the WSAP since that time.

Water Service Reliability - Groundwater

The Chino Basin groundwater supplies are managed by the Chino Basin Watermaster, as discussed in Section 6.2.2. During a normal year (FY 2019-20), the City met about 46 percent of its total demands with supplies from the Chino Basin. During a single dry year (FY 2017-18), the City met about 60 percent of its total demands with supplies from the Chino Basin. During a five consecutive year drought multiple dry year period (FY 2011-12 to FY 2015-16), the City met between 42 and 63 percent of its total demands with supplies from the Chino Basin.

Water Service Reliability Summary

Table 7-1 shows the water supplies during the base years (for average year, single dry year and a five consecutive year drought). As a result of the City's diverse water supply portfolio, water supplies may be re-apportioned during a five consecutive year drought to meet the City's water demands.

7.2.1 SERVICE RELIABILITY - CONSTRAINTS ON WATER SOURCES

CWC 10631.

(b)(1) A detailed discussion of anticipated supply availability under a normal water year, single dry year, and droughts lasting at least five years, as well as more frequent and severe periods of drought, as described in the drought risk assessment. For each source of water supply, consider any information pertinent to the reliability analysis conducted pursuant to Section 10635, including changes in supply due to climate change.

The City's sources of supplies consist of groundwater pumped from the Chino Basin; treated groundwater from the Chino Basin produced by the Chino Basin Desalter Authority; treated, imported surface water purchased from MWD through Water Facilities Authority; groundwater and/or surface water purchased from San Antonio Water Company; and recycled water purchased from Inland Empire Utilities Agency, as described in Section 6.2. Although all of these supplies are managed, the following constraints may occur which the City has considered in this reliability analysis.

Chino Basin

The City produces groundwater from the Chino Basin. The groundwater historically had been impacted by contamination. However, the City has developed and implemented appropriate treatment (blending and/or treatment facilities) which have been approved by SWRCB-DDW. These groundwater supplies are considered reliable both from a water quality and quantity standpoint.

Overall, groundwater quality in Chino Basin is generally good with better quality in the northern portion of the basin where recharge occurs. However, salinity (TDS) and nitrate-nitrogen concentrations increase in the southern portion of the basin. CDA treats the impaired groundwater by means of reverse osmosis, ion exchange, and air stripping, resulting in high quality drinking water. VOC plumes throughout Chino Basin, several of which are located within the City, are constantly being monitored.

The City has already inactivated several wells (Well 3, 4, 9, 15, 31, 35, and 50) due to high nitrate and perchlorate concentrations detected above the maximum contaminant levels (MCL). Well 34 was removed from service due to (TCP) water quality issues. The operations of Wells 44 and 52 are limited due to the migration of the bacterial groundwater plume when these wells are used too frequently. Well 25 was taken out of service due to a Perfluorooctanoic acid (PFOA) detection, which was below the PFOA interim notification level. The impact on supply due to the closure of these wells is minimized by constructing replacement wells at other locations where contaminant levels are low and constructing wellhead treatment facilities.

High levels (maximum concentration of 5,620 µg/L at one site) of TCE and chromium (485 µg/L) were found at one of the City's inactive well sites in 1987. They were found to have come from the General Electric Flatiron Facility, which operated a clothes iron manufacturing plant in the City from the early 1900s to 1982. Detectable, but low, concentrations of tetrachloroethene (PCE), toluene, and total xylenes were also found. The plant is no longer in operation, but an industrial park occupies the site. Since 1991, that area has been regularly monitored, and in 1995, two wells were constructed to extract groundwater, treat it, and direct it to the Ely Basins via the West Cucamonga Channel. The Ely Basins allowed the treated water to percolate back into the Chino Basin until 2005 when the basins became fully dedicated to the recharge of storm water, recycled water, and imported water pursuant to the long-term recharge plan executed by Watermaster and IEUA. As an alternative, three injection wells and conveyance pipelines were constructed in July 2011 to inject treated water into the Chino Basin. VOCs are also removed from contaminated soil through a Soil Vapor Extraction (SVE) system, which began in 2003.

VOCs were also located at the General Electric Test Facility, whose operations include testing and maintenance of commercial and military aircraft engines. In the past, hazardous wastes were disposed in dry wells, and this activity caused VOCs, such as TCE, PCE, cis-1,2-DCE, 1,2-dichloropropane, 1,1-DCE, 1,1-DCA, and chloroform, to appear in the soils and groundwater. A maximum concentration of 1,240 µg/L of TCE was measured at the site and 190 µg/L was quantified at an offsite monitoring well. Groundwater and soil remediation began in 1988 after a Consent Order was agreed upon by General Electric and the California Department of Public Health (CDPH). Since then, regular monitoring has been conducted, and status reports have been submitted. In 1996, vapor extraction treatment began, and as recently as 2008, contaminant levels in shallow soils have been deemed acceptable. The remediation process will continue until most, if not all, of the VOCs have been eliminated.

Quantities of TCE are found in private wells south of the Ontario International Airport in the area bounded by State Route 60 on the north, Bellegrave Ave. to the south, Turner Avenue on the east, and Grove Avenue on the west. The maximum concentration detected was 156 ug/L in 1990. Since 2016, the highest detected concentration was 90 ug/L. This area of TCE groundwater contamination is known as the South Archibald Plume and is believed to have come from several parties related to various activities within the airport. In September 2016, the Santa Ana Regional Water Quality Control Board issued a Final Stipulated Settlement and Cleanup & Abatement Order (CAO R8-2016-0016). The plume remediation alternative involves the use of existing and proposed CDA production wells and facilities. The remediation project is currently underway and includes the construction and operation of three new CDA production wells and a dedicated pipeline to convey groundwater produced from the wells to CDA's Chino II Desalter facility where TCE and other VOCs would be removed via air stripping. The project is anticipated to be operational in 2021.

Additionally, organic and inorganic compounds were discovered in the underlying groundwater when groundwater monitoring at the Milliken Sanitary Landfill began in 1987 as part of Solid Waste Assessment Test. An Evaluation Monitoring Program (EMP) was then launched, and 29 monitoring wells were drilled to assess the extent of damage of the compounds on the groundwater. Amounts of TCE, PCE, and dichlorodifluoromethane were found in combined concentrations as high as 159.6 μg/L. Other VOCs found at the site are vinyl chloride, benzene, 1,1-dichloroethane, and 1,2- dichloropropane. The landfill is owned by the County of San Bernardino and managed by the County's Waste System Division. It was inactivated in 1999.

Water quality in the Chino Basin is closely monitored by the Chino Basin Watermaster in compliance with the Optimum Basin Management Plan (OBMP). Data are collected by the Regional Water Quality Control Board (RWQBC) and other agencies that obtain groundwater from Chino Basin. The Chino Basin Watermaster then combines all data into a comprehensive database.

Imported water

The City also receives treated surface water from MWD through WFA. WFA purchases untreated water from IEUA (a MWD wholesale supplier). Constraints to water supplies from MWD relating to supply reliability is addressed in MWD's 2020 Regional Urban Water Management Plan. The relevant MWD discussion relating to supply reliability is provided in Appendix L.

7.2.2 SERVICE RELIABILITY - YEAR TYPE CHARACTERIZATION

7.2.2.1 TYPES OF YEARS

The City's base years for an average year, a single dry year, and a five consecutive year drought are discussed in Section 7.2 and are summarized in Table 7-1. As indicated in Chapter 6, the City's water supplies sources have been sufficient in meeting the City's historical water demands during an average year, a single dry year, and a five consecutive year drought. An average year was based on a historical year during the past 10 years with a total precipitation similar to the historical average precipitation in the vicinity of the City's service area. Because a single dry year or a five consecutive year drought period will not compromise the City's ability to provide a reliable supply of water to its customers, a single dry year in this Plan was selected based on one of the driest years during the past 10 years. The five consecutive year drought period was based on a period of five consecutive dry years during the past 10 years.

As indicated in Section 3.3, the historical average rainfall in the vicinity of the City's service area is 10.68 inches. FY 2019-20 represents an average or normal water year for the City in which the total amount of rainfall was similar to the historical average rainfall. A single dry year for the City was represented in FY 2017-18, in which the total amount of rainfall was less than the historical average rainfall. A five consecutive year drought period for the City is represented from FY 2011-12 to FY 2015-16, where the total amount of rainfall during each of these years was less than the historical average rainfall. Table 7-1 summarizes these "base years" for an average year, a single dry year and a five consecutive year drought period and provides the total amount of water supplies available to the City during those base years.

Table 7-1 Basis of Water Year Data (Reliability Assessment)

Submittal Table 7-1 Retail: Basis of Water Year Data (Reliability Assessment)			
Year Type	Base Year If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 2019-2020, use 2020	Available Supplies if Year Type Repeats	
		☐ Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location ___________________	
		☑ Quantification of available supplies is provided in this table as either volume only, percent only, or both.	
		Volume Available *	% of Average Supply
Average Year	2020	39,921	100%
Single-Dry Year	2018	43,346	108.6%
Consecutive Dry Years 1st Year	2012	42,603	106.7%
Consecutive Dry Years 2nd Year	2013	42,730	107.0%
Consecutive Dry Years 3rd Year	2014	45,196	113.2%
Consecutive Dry Years 4th Year	2015	41,226	103.3%
Consecutive Dry Years 5th Year	2016	36,036	90.3%
Supplier may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If a Supplier uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table.			
***Units of measure (AF, CCF, MG**) must remain consistent throughout the UWMP as reported in Table 2-3.*			
NOTES:			

7.2.2.2 SOURCES FOR WATER DATA

The monthly historical average temperatures (including minimum and maximum), monthly historical average rainfall, and monthly evapotranspiration in the vicinity of the City's service area are discussed in Section 3.3 Historical climate information was obtained from the WRCC, the National Oceanic and Atmospheric Administration, and from DWR's CIMIS.

7.2.3 WATER SERVICE RELIABILITY – SUPPLY AND DEMAND COMPARISON

CWC 10635.

(a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the long-term total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and a drought lasting five consecutive water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.

The City primarily obtains its water supplies from groundwater wells located in the Chino Basin. As discussed in Section 7.3 and shown in Table 7-2, Table 7-3, and Table 7-4, each of the City's water supply sources share the same base years. As previously discussed in Section 7.2.1, a single dry year or a five consecutive year drought period will not compromise the City's ability to provide a reliable supply of water to its customers.

As previously discussed in Section 4.2.6, the City's projected normal year water demands over the next 25 years, in five-year increments, were based on the City's 2020 Water Use Target of 196 GPCD for potable water demands. The ratio of total water supplies (including potable and recycled water supplies) available to the City during a historical normal year in FY 2019-20 (or 39,921 AF) and during a historical single dry year in FY 2017-18 (or 43,346 AF) was used to estimate the City's projected water demands during single dry years. The ratio of water supplies available to the City during a historical normal year in FY 2019-20 (or 39,921AF) and a historical five consecutive year drought period from FY 2011-12 to FY 2015-16 (or 42,603 AF, 42,730 AF, 45,196 AF, 41,226 AF and 36,036 AF, respectively) was used to estimate the City's projected water demands during a five consecutive year drought period. The City's projected dry year water supplies over the next 25 years were based on the minimum supplies needed by the City to meet projected single-dry year demands. Table 7-2, Table 7-3, and Table 7-4 summarize the City's projected water demands and supplies over the next 25 years in five-year increments, including during normal years, single dry years, and a five consecutive year drought periods. These tables indicate the City can meet water demands during normal years, single dry years, and a five consecutive year drought periods over the next 25 years.

7.2.3.1 WATER SERVICE RELIABILITY – NORMAL YEAR

Table 7-2 summarizes the City's projected water demands and supplies over the next 25 years in five-year increments during normal years. Table 7-2 indicates the City can meet water demands during normal years over the next 25 years.

Table 7-2 Normal Year Supply and Demand Comparison

Submittal Table 7-2 Retail: Normal Year Supply and Demand Comparison					
	2025	2030	2035	2040	2045 *(Opt)*
Supply totals *(autofill from Table 6-9)*	52,550	58,513	63,838	73,668	73,668
Demand totals *(autofill from Table 4-3)*	52,550	58,513	63,838	73,668	73,668
Difference	0	0	0	0	0
NOTES: Supply and demand are equal for years 2040 and 2045 because the City anticipates buildout to occur in 2040.					

7.2.3.2 WATER SERVICE RELIABILITY – SINGLE DRY YEAR

Table 7-3 summarizes the City's projected water demands and supplies over the next 25 years in five-year increments during single dry years. Table 7-3 indicates the City can meet water demands during single dry years over the next 25 years.

Table 7-3 Single Dry Year Supply and Demand Comparison

Submittal Table 7-3 Retail: Single Dry Year Supply and Demand Comparison					
	2025	2030	2035	2040	2045 (Opt)
Supply totals*	57,058	63,534	68,847	79,989	79,989
Demand totals*	57,058	63,534	68,847	79,989	79,989
Difference	0	0	0	0	0
***Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*					
NOTES: Supply and demand are equal for years 2040 and 2045 because the City anticipates buildout to occur in 2040.					

7.2.3.3 WATER SERVICE RELIABILITY – FIVE CONSECUTIVE DRY YEARS

Table 7-4 summarizes the City's projected water demands and supplies over the next 25 years in five-year increments during five consecutive year drought periods. Table 7-4 indicates the City can meet water demands during five consecutive year drought periods over the next 25 years.

Table 7-4 Multiple Dry Years Supply and Demand Comparison

Submittal Table 7-4 Retail: Multiple Dry Years Supply and Demand Comparison						
		2025*	2030*	2035*	2040*	2045* (Opt)
First year	Supply totals	56,080	62,445	67,667	78,618	78,618
	Demand totals	56,080	62,445	67,667	78,618	78,618
	Difference	0	0	0	0	0
Second year	Supply totals	56,248	62,632	67,870	78,853	78,853
	Demand totals	56,248	62,632	67,870	78,853	78,853
	Difference	0	0	0	0	0
Third year	Supply totals	59,493	66,246	71,786	83,403	83,403

	Demand totals	47,436	52,820	57,237	66,500	66,500
	Difference	0	0	0	0	0
Sixth year *(optional)*	Supply totals					
	Demand totals					
	Difference	0	0	0	0	0
Units of measure (AF, CCF, MG) *must remain consistent throughout the UWMP as reported in Table 2-3.*						
NOTES: Supply and demand are equal for years 2040 and 2045 because the City anticipates buildout to occur in 2040.						

7.2.4 DESCRIPTION OF MANAGEMENT TOOLS AND OPTIONS

CWC 10620.

(f) An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.

As noted in Section 6.2.2, the Chino Basin is managed under the Chino Basin adjudication. During the period of management under the Judgment, significant drought events have occurred. In each drought cycle the Chino Basin has been managed to maintain water levels. Therefore, based on historical and on-going management practices, the City will be able to rely on the Chino Basin for adequate supply over the next 25 years under single dry years and a five consecutive year drought periods.

Section 6.2.2 provides a description of the management of groundwater resources in the Chino Basin, as well as information on basin management. Chapter 6 also demonstrates the management structure of the Chino Basin provides a reliable source of groundwater supply for the City during a normal year, a single-dry year and a five consecutive year drought. Historical data indicates the Chino Basin has been well managed for the full period of the adjudication, resulting in a stable and reliable water supply. Basin management changes are discussed in Section 6.2.2 and include increased direct use of recycled water (see Section 6.5) and the continued use of recycled water for groundwater replenishment in the Chino Basin to reduce the need to import water from other regions. Therefore, the groundwater supplies in the Chino Basin are deemed reliable.

7.3 DROUGHT RISK ASSESSMENT

CWC 10635.

(b) Every urban water supplier shall include, as part of its urban water management plan, a drought risk assessment for its water service to its customers as part of information considered in developing the demand management measures and water supply projects and programs to be included in the urban water management plan. The urban water supplier may conduct an interim update or updates to this drought risk assessment within the five-year cycle of its urban water management plan update. The drought risk assessment shall include each of the following:

(1) A description of the data, methodology, and basis for one or more supply shortage conditions that are necessary to conduct a drought risk assessment for a drought period that lasts five consecutive water years, starting from the year following when the assessment is conducted.

(2) A determination of the reliability of each source of supply under a variety of water shortage conditions. This may include a determination that a particular source of water supply is fully reliable under most, if not all, conditions.

(3) A comparison of the total water supply sources available to the water supplier with the total projected water use for the drought period.

(4) Considerations of the historical drought hydrology, plausible changes on projected supplies and demands under climate change conditions, anticipated regulatory changes, and other locally applicable criteria.

The City's sources of supplies consist of groundwater from the Chino Basin (which is managed under the Chino Basin adjudication), treated import water purchased through Water Facilities Authority and managed by the Metropolitan Water District of Southern California, groundwater and/or surface water purchased from San Antonio Water Company, and recycled water purchased from inland Empire Utilities Agency. The following discussion provides a DRA which assesses the City's water supply reliability over a five-year consecutive drought period. The City's DRA incorporates a five-year consecutive drought from FY 2020-21 through FY 2024-25 and includes a review of water supplies, water uses, and water supply reliability.

7.3.1 DRA DATA, METHODS, AND BASIS FOR WATER SHORTAGE CONDITIONS

The City's DRA was prepared using historical production data from the City's water supply sources. The following assumptions were considered during the preparation of the City's DRA for each year of the five-year consecutive drought.

- The five consecutive year drought period associated with the 2020 UWMP is based on five consecutive dry years from FY 2020-21 through FY 2024-25.
- The projected water supplies available during each year of this five consecutive year drought are assumed to be identical to the water supplies produced during each year between FY 2011-12 and FY 2015-16 (which represents the most recent and historical five consecutive year drought).
- The projected demands during this five consecutive year drought are based on water demands from FY 2019-20 (a normal year) which were adjusted based on projected population over the next five years along with the ratio of the normal year demands to actual demands over each year of the most recent and historical five consecutive year drought period (from FY 2011-12 and FY 2015-16).
- The projected demands were compared to the projected supplies to identify potential water supply deficits which may require implementation of the Water Shortage Contingency Plan (discussed further in Chapter 8).

The following hypothetical methodologies were considered during the preparation of the City's DRA during for each year of the five consecutive year drought:

- Drought Year 1: The region had experienced an average to above average year of precipitation in the prior year. Water use in the prior year had been below average due to a reduced need for outdoor water use, the groundwater basin had been replenished from above average local stormwater runoff, and imported water supplies were not restricted.
- Drought Year 2: The region experienced a second year of below average precipitation and runoff. Retail customers increase water use for outdoor irrigation to compensate for lack of precipitation, however, this increased use is partially offset by conservation measures. Groundwater and imported water supplies have not been impacted.
- Drought Year 3: The region experienced a third year of below average precipitation and runoff. Retail customers increase water use for outdoor irrigation to compensate for lack of precipitation; however, this increased use is partially offset by heightened conservation messaging. Groundwater and imported water supplies have not been impacted. However, there is an increased demand on both groundwater and treated imported water.
- Drought Year 4: The region experienced a fourth year of below average precipitation and runoff. Groundwater supplies have not been impacted. However, there is an increased demand on groundwater.
- Drought Year 5: Fifth year of below average precipitation and runoff. Groundwater supplies have not been impacted. However, there is an increased demand on groundwater.

7.3.2 DRA INDIVIDUAL WATER SOURCE RELIABILITY

The City's DRA incorporates a five-year consecutive drought based on five consecutive dry years commencing in FY 2021-22. The quantity of water supplies available for each year during this five-year consecutive drought period included in the City's DRA is assumed to be the same as the quantity of water supplies produced by the City (i.e. demands) during the most recent and historical five-year consecutive drought which occurred from FY 2011-12 through FY 2015-16. Production data for those years have been tabulated in Section 6.1. The following describes the anticipated reliability of each water source for each year of the five consecutive year drought based on recent experience.

Groundwater

The City receives water supplies from the Chino Basin, which is actively managed under the Chino Basin adjudication, as described in Section 6.2.2. Each year the Chino Basin Watermaster reviews water supply conditions including local rainfall, groundwater levels, local stormwater runoff available for replenishment, imported water availability and the amount of water stored in the groundwater basin for future demands, to ensure the Basin is responsibly managed. Regardless of the annual safe yield adopted (a new safe yield is adopted every ten years) there is never a restriction on the amount of water which may be pumped from the Chino Basin, subject to replenishment requirements under the Chino Basin Watermaster's oversight. The quantity of groundwater used (and reliably available) during the most recent and historical five consecutive year drought period have been tabulated in Section 6.1. During this period, the City was able to increase its production of its groundwater supplies from an adjudicated and managed groundwater basin. The City also had the ability to systematically implement aspects of its Water Shortage Contingency Plan (see Chapter 8). As a result of these collective actions (and experience during prior consecutive five-year droughts), the City does not anticipate a water supply shortage from the Chino Basin.

Imported Water

The City obtains imported water from the Metropolitan Water District of Southern California through Water Facilities Authority. Section 6.2.1 describes the planning conducted by the Metropolitan Water District of Southern California regarding treated imported water supplies available to the City. The reliability of MWD's supplies is also discussed in its 2020 Regional UWMP and is incorporated by reference. The City purchases treated imported water which is delivered directly within its distribution system. The City's purchases of treated, imported water over the past ten years have been tabulated in Section 6.1. In the event of a drought which limits imported water supplies, the City will rely on its groundwater production and will pay the applicable assessments to purchase untreated imported water to be delivered in the future when supplies are available.

The imported water purchases by the City during the most recent and historical five consecutive year drought period have been tabulated in Section 6.1. Because the City's DRA assumes the most recent and historical five consecutive year drought scenario will be repeated over the next five years, it is assumed the quantity of treated imported water supplies purchased during the most recent and historical five consecutive year drought scenario will be available. Furthermore, this constitutes the minimum amount of treated imported water which may be available in a future five consecutive year drought absent MWD's programs which it has since implemented.

Recycled Water

The City has a recycled water distribution system which it has developed over the years to reduced demands on its potable water supplies as described in Section 6.2.5. The availability of recycled water supplies is not adversely impacted by drought conditions and are locally available.

The quantity of recycled water used during the most recent and historical five consecutive year drought period have been tabulated in Section 6.1. The quantity of recycled water available during each year of the most recent and historical five consecutive year drought is expected to be available during a future five consecutive year drought.

Summary

The City's water system has experienced a prior five consecutive year drought with no limitation to its collective water supplies. However, the cost of those water supplies may have increased based on the mix of supplies which are used. Consequently, the City has the ability to enact varying water shortage levels (see Chapter 8) to help educate its customers and provide an economic incentive for the retail customers to reduce their water consumption.

7.3.3 DRA TOTAL WATER SUPPLY AND USE COMPARISON

Gross water use for the projected five consecutive year drought is shown on Table 7-5. Section 7.3.2 describes the water source reliability for each source of supply the City will rely on during a five consecutive year drought. The annual quantities are summed and are also provided on Table 7-5. The most important aspect of the City's water supplies is the groundwater which can be produced from a managed groundwater basin without restriction on the amount the City is allowed to produce. However, for the purposes of the City's DRA, as a worst-case scenario, the City has considered no water supply augmentation (as indicated in Table 7-5) from its groundwater supplies. When necessary, the City can implement various water shortage levels of its Water Shortage Contingency Plan (as discussed in Chapter 8) in order to reduce its water demands. The total water supplies available to the City shown in Table 7-5 are based on the quantity of supplies produced by the City (i.e. demands) during the most recent historical five consecutive drought period (from FY 2011-12 through FY 2015-16) as provided in Table 7-1. As shown in Table 7-5, assuming no additional water supply benefits will be available from groundwater supplies, the City will implement various stages of its Water Shortage Contingency Plan to balance water demands with available supplies during years 1, 2, 3, 4, and 5 of the projected five consecutive year drought.

Table 7-5 Five-Year Drought Risk Assessment Tables to Address Water Code Section 10635(b)

Submittal Table 7-5: Five-Year Drought Risk Assessment Tables to address Water Code Section 10635(b)	
2021	**Total**

WSCP - supply augmentation benefit	0
WSCP - use reduction savings benefit	11,400
Revised Surplus/(shortfall)	0
Resulting % Use Reduction from WSCP action	24%

7.3.4 OPTIONAL PLANNING TOOL WORKBOOK

DWR has deemed the "Planning Tool Worksheet" as optional and the City is not required by DWR to use the tool. The City has provided sufficient water supplies to its customers, including during long-term droughts and years with historically high water demands. The City has also been able to provide water service to meet maximum day water demands for these years, including during the summer months. The City obtains the majority of its water supplies from a managed groundwater basin which is not subject to seasonal fluctuation. Consequently, an evaluation regarding water supplies on a monthly basis was not considered.

Chapter 8

WATER SHORTAGE CONTINGENCY PLAN

LAY DESCRIPTION – CHAPTER 8

WATER SHORTAGE CONTINGENCY PLAN

Chapter 8 (Water Shortage Contingency Plan) of the City's 2020 Plan discusses and provides the following:

- The City's Water Shortage Contingency Plan is a detailed approach which presents how the City intends to act, or respond, in the case of an actual water shortage contingency.
- Preparation of the City's "Annual Water Supply and Demand Assessment" (or Annual Assessment) is discussed. Commencing July 1, 2022, the City is required to submit the Annual Assessment. The Annual Assessment will include a review of the City's "unconstrained" water demands for the current year and for a potential upcoming single dry year. Unconstrained water demands represent the City's water demands prior to any "response actions" the City may invoke pursuant to the City's Water Shortage Contingency Plan.
- The City will manage water supplies to minimize the adverse impacts of water shortages. The City's plan for water usage during periods of shortage is designed to incorporate six standard water shortage levels corresponding to progressive ranges from up to a 10, 20, 30, 40, and 50 percent shortage, and greater than a 50 percent shortage.
- For each declared water supply shortage level, customers will be required to reduce their consumption by the percentage specified in the corresponding water supply shortage level.
- For each declared water supply shortage level, the City has established response actions to reduce demand on water supplies and to reduce any shortage gaps in water supplies. These demand reduction actions include irrigation and other outdoor use restrictions, rate structure changes, and other water use prohibitions.
- The operational changes the City will consider in addressing water shortages on a short-term basis are discussed and include improved monitoring, analysis, and tracking of customer water usage to enforce demand reduction measures.
- The City's Emergency Response Plan is summarized. The Emergency Response Plan provides the management, procedures, and designated actions the City and its employees will implement during emergency situations (including catastrophic water shortages) resulting from natural disasters, system failures, and other unforeseen circumstances.
- The preparation of the City's seismic risk assessment and mitigation plan is discussed. The locations of earthquake faults in the vicinity of the City's water service area are provided.
- The effectiveness of the shortage response actions for each of the City's standard water shortage levels is presented. The City has been able to provide sufficient water supplies to

its customers, including during long-term droughts and years with historically high water demands.

- The communication protocols implemented by the City when it declares any water shortage level are presented.
- The compliance and enforcement procedures associated with City's standard water shortage levels are presented.
- The legal authorities associated with City's standard water shortage levels are presented.
- The financial consequences associated with City's standard water shortage levels are presented.
- The City will evaluate the need for revising the Water Shortage Contingency Plan in order to resolve any water shortage gaps, as necessary. The steps necessary for the City to adopt and amend its Water Shortage Contingency Plan are presented.

The following Water Shortage Contingency Plan includes references to Chapters and Sections from the City of Ontario's 2020 Urban Water Management Plan:

8.1 WATER SUPPLY RELIABILITY ANALYSIS

CWC 10632.

(a)(1) The analysis of water supply reliability conducted pursuant to Section 10635.

The City's sources of supply were discussed in Section 6.2 of the 2020 UWMP and consist of groundwater pumped from the Chino Basin; treated groundwater from the Chino Basin produced by the Chino Basin Desalter Authority; treated, imported water purchased from MWD through Water Facilities Authority; groundwater and/or surface water purchased from San Antonio Water Company; and recycled water purchased from Inland Empire Utilities Agency. The City provides recycled water for irrigation instead of potable supplies. The Chino Basin is adjudicated, and groundwater supplies are managed. The reliability of the various sources of supply are discussed in Chapter 7 of the 2020 UWMP. Based on the adjudication provisions in the Chino Basin, the City is able to produce groundwater without limitation, provided any amount produced in excess of the production rights is replenished. Imported water supplies (both treated and untreated) may be impacted in the event MWD implements its WSAP due to a water supply shortage. Finally, recycled water is locally generated and generally is not impacted by drought conditions. Section 7.2.3 summarizes the City's projected water demands and supplies over the next 25 years in five-year increments, including during normal years, single dry years, and a five consecutive year drought periods. These tables indicate the City can meet water demands during normal years, single dry years, and a five consecutive year drought periods over the next 25 years. Consequently, it is anticipated the City will have sufficient water supplies available to meet projected demands.

8.2 ANNUAL WATER SUPPLY AND DEMAND ASSESSMENT PROCEDURES

<u>CWC 10632.</u>

(a)(2) The procedures used in conducting an annual water supply and demand assessment that include, at a minimum, both of the following:

(A) The written decision-making process that an urban water supplier will use each year to determine its water supply reliability.

(B) The key data inputs and assessment methodology used to evaluate the urban water supplier's water supply reliability for the current year and one dry year, including all of the following:

(i) Current year unconstrained demand, considering weather, growth, and other influencing factors, such as policies to manage current supplies to meet demand objectives in future years, as applicable.

(ii) Current year available supply, considering hydrological and regulatory conditions in the current year and one dry year. The annual supply and demand assessment may consider more than one dry year solely at the discretion of the urban water supplier.

(iii) Existing infrastructure capabilities and plausible constraints.

(iv) A defined set of locally applicable evaluation criteria that are consistently relied upon for each annual water supply and demand assessment.

(v) A description and quantification of each source of water supply.

<u>CWC 10632.1.</u>

An urban water supplier shall conduct an annual water supply and demand assessment pursuant to subdivision (a) of Section 10632 and, on or before July 1 of each year, submit an annual water shortage assessment report to the department with information for anticipated shortage, triggered shortage response actions, compliance and enforcement actions, and communication actions consistent with the supplier's water shortage contingency plan. An urban water supplier that relies on imported water from the State Water Project or the Bureau of Reclamation shall submit its annual water supply and demand assessment within 14 days of receiving its final allocations, or by July 1 of each year, whichever is later.

Commencing July 1, 2022, the City is required to submit an "Annual Water Supply and Demand Assessment" (Annual Assessment) in accordance with DWR's guidance and requirements. The Annual Assessment will include a review of the City's unconstrained water demands (i.e. water demands prior to any projected response actions the City may trigger under this WSCP) for the current year and the upcoming (potential single dry) year. The City will also include information regarding anticipated shortages, triggered shortage response actions, compliance and enforcement actions, and communication actions consistent with the City's WSCP.

For each Annual Assessment, the City plans to prepare a preliminary assessment which evaluates the adequacy of its water supplies for the current and upcoming years by April of each year. The preliminary assessment will include a review of water supplies for at least a single dry year.

The components of an Annual Assessment consist of the following:

- A written decision-making process
- Key data inputs and assessment methodology

8.2.1 DECISION MAKING PROCESS

The City produces groundwater from the Chino Basin as its primary source of water supply and that basin is managed on a fiscal year basis. Consequently, during the third quarter of each fiscal year the City will review its water demands from the initial six months along with the current groundwater basin conditions and local hydrology. This information will be used to help develop the Annual Assessment. A draft of the Annual Assessment will be circulated internally within the City for peer review and comment. Based on comments received, a redraft will be prepared and provided to City managers during the Spring of each year. The draft subsequently will be provided to the City Manager for final review. Subsequently, a final draft of the Annual Assessment will be provided to the City Council as necessary for review and included in the agenda as part of a City Council meeting such that it can be reviewed or approved and any recommended specific shortage response actions may be enacted. The final Annual Assessment will be provided to DWR no later than July 1 of each year.

The Annual Assessments will be instrumental in providing guidance to the City for decisions regarding potential declarations of a water supply shortage and implementation of water reduction stages, instituting mandatory water restrictions, promoting water use efficiency and conservation programs, adopting and implementing water rates and drought rate surcharges, and pursuing alternative water supplies when necessary. This process will help ensure adequate water supplies resources are available to the City.

8.2.2 DATA AND METHODOLOGIES

The key data inputs and methodologies which will be evaluated by the City during the preparation of the preliminary assessment will include the following:

1) Evaluation Criteria: The locally applicable evaluation criteria used to prepare the Annual Assessment will be identified. The evaluation criteria will include, but is not limited to, an analysis of current local hydrology (including rainfall and groundwater levels), current water demands, a review of water system improvement plans which may impact infrastructure availability, and water quality regulations which may impact groundwater availability.

2) Water Supply: A description of each available water supply source will be provided. The descriptions will include a quantification of each available water supply source and will be based on review of current production capacities, historical production, Urban Water Management Plans, and prior water supply studies (including Water Supply Assessments and/or Master Plans).

3) Unconstrained Water Demand: The potential unconstrained water demands during the current year and the upcoming (potential single dry) year, prior to any special shortage response actions, will be reviewed. The review will include factors such as weather, existing and projected land uses and populations, actual customer consumption and water use factors, monthly Urban Water Supplier Monthly Reports, existing water shortage levels (see Section 8.3), and existing water conservation ordinances (see Section 9.2.1).

4) Planned Water Use for Current Year Considering Dry Subsequent Year: The water supplies available and projected for use to meet the demands during the current year and the upcoming (potential single dry) year will be considered and identified by each type of supply. The evaluation will include factors such as estimated water demands, weather, groundwater basin operating safe yields, water quality results, existing available pumping capacities, imported water allocations, contractual obligations, regulatory issues, use of emergency interconnections, and the costs associated with producing each water supply source.

5) Infrastructure Considerations: The capabilities of the water system infrastructure to meet the water demands during the current year and the upcoming (potential single dry) year will be considered. Available production capacities (e.g. groundwater well capacities) and distribution system water losses (see Section 4.2.4) will be reviewed. In addition, capital improvement and replacement projects, as well as potential projects which may increase water system and production capacities (see Section 6.2.8), will be considered.

6) Other Factors: Additional local considerations, if any, which can affect the availability of water supplies will be described.

8.3 SIX STANDARD WATER SHORTAGE LEVELS

CWC 10632.

(a)(3)(A) Six standard water shortage levels corresponding to progressive ranges of up to 10, 20, 30, 40, and 50 percent shortages and greater than 50 percent shortage. Urban water suppliers shall define these shortage levels based on the suppliers' water supply conditions, including percentage reductions in water supply, changes in groundwater levels, changes in surface elevation or level of subsidence, or other changes in hydrological or other local conditions indicative of the water supply available for use. Shortage levels shall also apply to catastrophic interruption of water supplies, including, but not limited to, a regional power outage, an earthquake, and other potential emergency events.

(a)(3)(B) An urban water supplier with an existing water shortage contingency plan that uses different water shortage levels may comply with the requirement in subparagraph (A) by developing and indicating a cross-reference relating its existing categories to the six standardized water shortage levels.

The City has a legal responsibility to provide water utility services, including water for residential, commercial, industrial, public authority, and for public fire hydrants and private fire services. The City will manage water supplies prudently to minimize the adverse impacts of water shortages. In its 2015 Plan, the City's WSCP was designed to provide a minimum of 50 percent of normal supply during a severe or extended water shortage. For its 2020 Plan, the City's WSCP is designed to provide water supplies in the event there is less than 50 percent of normal supply during a severe or extended water shortage. Water shortage trigger mechanisms have been established to ensure that this policy is implemented. This includes structured stages of action referred to as water supply shortage planning levels.

Table 8-1 provides a description of the six standard stages of action which may be triggered by a shortage in one or more of the City's water supply sources, depending on the severity of the shortage and its anticipated duration.

Table 8-1 Water Shortage Contingency Planning Levels

Submittal Table 8-1 Water Shortage Contingency Plan Levels		
Shortage Level	**Percent Shortage Range**	**Shortage Response Actions** *(Narrative description)*
1	Up to 10%	Washing of motor vehicles, trailers, boats or other types of mobile equipment shall be done only with a hand-held bucket or a hose equipped with a positive shutoff nozzle for quick rinses, except that washing may be done at the immediate premises of a commercial car wash or with reclaimed wastewater. No person shall sprinkle, water, or irrigate any landscaped or vegetated areas between the hours of 9:00 a.m. and 4:00 p.m.
2	Up to 20%	In addition to Shortage Level 1, operators of hotels and motels must provide the option of choosing not to have towels and linens laundered daily. Irrigation is prohibited during and within 48 hours of rainfall.
3	Up to 30%	In addition to Shortage Level 2, the use of fire hydrants shall be limited to fire fighting and related activities and other uses of water for municipal purposes shall be limited to activities necessary to maintain the public health, safety, and welfare. Unless written permission has been granted by the City Manager or his/her designee, the use of potable water for construction activities and grading shall be prohibited.
4	Up to 40%	In addition to Shortage Level 3, residents and CII customers will be prohibited from irrigating turf or other landscaping more than two days a week. No person shall irrigate any turf or landscaped area more than fifteen minutes (15) on watering days. No vehicles shall be washed unless it is taken to a carwash.
5	Up to 50%	In addition to Shortage Level 4, residents and CII customers will be prohibited from irrigating turf or other landscaping more than one day a week.
6	>50%	In addition to Shortage Level 5, unless otherwise permitted by a resolution of the City Council, there shall be no use of potable water for irrigation of outdoor landscape or turf. Commercial nurseries shall be prohibited from the use of potable water for irrigation of outdoor, landscape and turf except by use of a hand-held hose equipped with a positive shutoff nozzle. The following nonessential use of water shall be prohibited: the filling, cycling, filtering, or refilling of swimming pools, spas, Jacuzzis, fountains or other like devices.
NOTES:		

The 2020 Plan requires urban water suppliers to have six standardized water shortage response actions in accordance with DWR. The City's previous WSCP, originally included in the City's 2015 Plan as Ordinance No. 3027 (see Appendix M), established a voluntary stage followed by four water supply shortage levels that would be mandatory once put into effect: Stage 1 addresses a water supply shortage of up to 10 percent; Stage 2 addresses a water supply shortage of up to 20 percent; Stage 3 addresses a water supply shortage of anywhere between 20 percent to 50 percent; and Stage 4 addresses a water supply shortage of more than 50 percent.

For its 2020 Plan, the City has prepared a draft Water Conservation Plan (see Appendix N) that will address the six standard stages of action in accordance with DWR. Under this draft Water Conservation Plan, the City will continue to incorporate Ordinance No. 3027's voluntary stage during normal water supply conditions as well as the existing Stage 1 and Stage 2 water supply shortage levels as is. However, the City has amended Stage 3 to address a water supply shortage of up to 30 percent. In addition, the City has included a Stage 4 and Stage 5 that will be used to address a water supply shortage of up to 40 percent, and 50 percent, respectively. The City's existing Stage 4 has been amended to a Stage 6 level which addresses a water supply shortage of more than 50 percent.

8.4 SHORTAGE RESPONSE ACTIONS

CWC 10632.

(a)(4) Shortage response actions that align with the defined shortage levels and include, at a minimum, all of the following:

(A) Locally appropriate supply augmentation actions.

(B) Locally appropriate demand reduction actions to adequately respond to shortages.

(C) Locally appropriate operational changes.

(D) Additional, mandatory prohibitions against specific water use practices that are in addition to state-mandated prohibitions and appropriate to the local conditions.

(E) For each action, an estimate of the extent to which the gap between supplies and demand will be reduced by implementation of the action.

8.4.1 DEMAND REDUCTION

Voluntary Conservation Stage

All persons are encouraged to voluntarily limit the amount of water used to the amount absolutely necessary for health and safety, business operations, and irrigation. Except as otherwise provided in this chapter where a declared water shortage stage or water shortage emergency requires mandatory or other more stringent requirements, the following elements of conservation apply at all times on a voluntary basis by all persons within the City:

1) Avoid hose washing of sidewalks, walkways, driveways, parking areas or other paved surfaces, except as required for sanitary purposes. If a person uses a hand-held hose to wash any paved surfaces, the hose shall be equipped with a positive shutoff nozzle.
2) Wash motor vehicles, trailers, boats, and other types of mobile equipment using a hand-held bucket, or a hose equipped with a positive shutoff nozzle for quick rinses, or at the immediate premises of a commercial car wash or with recycled wastewater for approved uses.
3) Avoid using water to clean, fill, or maintain levels in decorative fountains, ponds, lakes, or other similar aesthetic structures unless such water is part of a recycling system.

4) Encourage restaurants, hotels, cafes, cafeterias, or other public places where food is sold, served or offered for sale, to serve drinking water only to those customers expressly requesting water.
5) Promptly repair all leaks from indoor and outdoor plumbing fixtures.
6) Avoid watering lawn, landscape or other turf areas more often than every other day and during the hours between 6:00 a.m. and 6:00 p.m.
7) Avoid causing or allowing the water to run off landscape areas into adjoining streets, sidewalks, or other paved areas due to incorrectly directed or maintained sprinklers or excessive watering.

Stage 1 Water Supply Shortage (Up to 10%)

During a Stage 1, the following mandatory restrictions on the use of potable water shall be applicable when the City Council determines that the City's water conservation goals are not being met by voluntary water conservation measures, or that the City's water supplies are likely to be reduced by up to ten percent (10%) or it has otherwise been requested or directed by executive order or regulation of a State agency to reduce its potable water consumption or production by a specified amount.

1) Except as required for health and sanitary purposes, washing of sidewalks, driveways, parking areas or other paved surfaces is prohibited. Any hand-held hose used for such purposes shall be equipped with a positive shutoff nozzle.
2) Washing of motor vehicles, trailers, boats or other types of mobile equipment shall be done only with a hand-held bucket or a hose equipped with a positive shutoff nozzle for quick rinses, except that washing may be done at the immediate premises of a commercial car wash or with reclaimed wastewater.
3) No water shall be used to clean, fill or maintain levels in decorative fountains, ponds, lakes or other similar aesthetic structures unless such water is part of a recycling system.
4) No restaurant, hotel, café, cafeteria or other public place where food is sold, served or offered for sale, shall serve drinking water to any customer unless expressly requested.
5) All water customers of the City shall promptly repair all leaks from indoor and outdoor plumbing fixtures. Such leak shall be repaired in a timely manner after notification by the City, but in no case after notification in excess of 72 hours for the first violation and then every 72 hours thereafter for the second and third violations.
6) No person shall sprinkle, water, or irrigate any landscaped or vegetated areas between the hours of 9:00 a.m. and 4:00 p.m. In any event, such watering shall not be in excess of needs nor be of a manner that allows water flow onto streets or other paved areas. The above mentioned may be watered by a hand-held hose equipped with a positive shutoff nozzle at any time of the day. Commercial nurseries, golf courses, and other water-dependent industries are exempt.
7) No water customer of the City shall cause or allow the water to run off landscaped area into adjoining streets, sidewalks or other paved areas due to incorrectly directed or maintained sprinkler or excessive watering.

8) The use of water from fire hydrants shall be limited to fire fighting and related activities necessary to maintain the public health, safety, and welfare. An exception may be made for construction use through a proper City-Designated meter. The use of potable water for construction activities shall be restricted in areas where recycled water is available for such use.

<u>Stage 2 Water Supply Shortage (Up to 20%)</u>

During a Stage 2, the following mandatory restrictions on the use of potable water shall be applicable when the City Council determines that it is likely that the City will suffer a reduction of more than ten percent (10%) up to twenty percent (20%) in its water supplies or it has otherwise been requested or directed by executive order or regulation of a State Agency to reduce its potable water consumption or production by a specified amount.

1) All the prohibitions and restrictions in Stage 1 shall be in effect provided that the more restrictive measures noted in this Stage shall take precedence.
2) Filling or refilling of empty swimming pools shall not occur without the written permission of the City Manager or his/her designee.
3) All customers are prohibited from irrigating turf or ornamental landscapes during and within 48 hours following measurable rainfall.
4) Operators of hotels and motels must provide guests with the option of choosing not to have towels and linens laundered daily and prominently display notice of this option.
5) All persons, including the City, are prohibited from irrigating with potable water any ornamental turf on public street medians.
6) The use of potable water irrigation outside of newly constructed homes and buildings shall be consistent with the California Building Standards Commission and the Department of Housing & Community Development.

<u>Stage 3 Water Supply Shortage (Up to 30%)</u>

During a Stage 3, the following mandatory restrictions on the use of potable water shall be applicable when the City Council determines that it is likely that the City will suffer a reduction of more than twenty percent (20%) and up to thirty percent (30%) in its water supplies or it has otherwise been requested or directed by executive order or regulation of a State Agency to reduce its potable water consumption or production by a specified amount.

1) All the prohibitions and restrictions in the preceding Stages shall be in effect provided that the more restrictive measures noted in this Stage shall take precedence.
2) Residents and CII customers will be prohibited from irrigating any turf or landscape area more than four (4) days a week.
3) The use of water from fire hydrants shall be limited to fire fighting and related activities and other uses of water for municipal purposes shall be limited to activities necessary to maintain the public health, safety, and welfare. Unless written permission has been granted

by the City Manager or his/her designee, the use of potable water for construction activities and grading shall be prohibited.

Stage 4 Water Supply Shortage (Up to 40%)

During a Stage 4, the following mandatory restrictions on the use of potable water shall be applicable when the City Council determines that it is likely that the City will suffer a reduction of more than thirty percent (30%) and up to forty percent (40%) in its water supplies or it has otherwise been requested or directed by executive order or regulation of a State Agency to reduce its potable water consumption or production by a specified amount.

1) All the prohibitions and restrictions in the preceding Stages shall be in effect provided that the more restrictive measures noted in this Stage shall take precedence.
2) Residents and CII customers will be prohibited from irrigating turf or other landscaping more than two (2) days a week.
3) No person shall irrigate any turf or landscaped area more than fifteen minutes (15) on watering days.
4) No vehicles shall be washed unless it is taken to a carwash.

Stage 5 Water Supply Shortage (Up to 50%)

During a Stage 5, the following mandatory restrictions on the use of potable water shall be applicable when the City Council determines that it is likely that the City will suffer a reduction of more than forty percent (40%) and up to fifty percent (50%) in its water supplies or it has otherwise been requested or directed by executive order or regulation of a State Agency to reduce its potable water consumption or production by a specified amount.

1) All the prohibitions and restrictions in the preceding Stages shall be in effect provided that the more restrictive measures noted in this Stage shall take precedence.
2) Residents and CII customers will be prohibited from irrigating turf or other landscaping more than one (1) day a week.

Stage 6 Water Supply Shortage Emergency (More than 50%)

During Stage 6, the following mandatory restrictions on the use of potable water shall be applicable when the City Council determines that it is likely that the City will suffer a reduction of more than fifty percent (50%) in its water supplies or it has otherwise been requested or directed by executive order or regulation of a State agency to reduce its potable water consumption or production by a specified amount. A water shortage emergency may be declared whenever the City Council finds and determines that the ordinary demands and requirements of water consumers cannot be satisfied without depleting the water supply of the City to the extent that there would be insufficient water for human consumption, sanitation, and fire protection. A water shortage emergency may include an immediate emergency. An immediate emergency may occur as a result of a breakage or failure of a dam, pump, pipe line or conduit, a major earthquake, large-scale fire, or other so called "Act of God" which may have serious impacts on the City's available water supply.

The following restrictions on the use of potable water shall be applicable during a Stage 6 Water Supply Shortage Emergency:

1) All the prohibitions and restrictions in the preceding Stages shall be in effect provided that the more restrictive measures noted in this Stage shall take precedence.
2) Unless otherwise permitted by a resolution of the City Council, there shall be no use of potable water for irrigation of outdoor landscape or turf.
3) Commercial nurseries shall be prohibited from the use of potable water for irrigation of outdoor, landscape and turf except by use of a hand-held hose equipped with a positive shutoff nozzle.
4) The following nonessential use of water shall be prohibited: the filling, cycling, filtering, or refilling of swimming pools, spas, Jacuzzis, fountains or other like devices.

Add additional rows as needed				
1	Other - Prohibit use of potable water for washing hard surfaces	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF		Yes
1	Other - Require automatic shut of hoses	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF		Yes
1	Water Features - Restrict water use for decorative water features, such as fountains	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF		Yes
1	CII - Restaurants may only serve water upon request	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF		Yes
1	Other - Customers must repair leaks, breaks, and malfunctions in a timely manner	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF		Yes
1	Landscape - Limit landscape irrigation to specific times	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF		Yes
1	Landscape - Restrict or prohibit runoff from landscape irrigation	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF		Yes
1	Other	Collective reduction from all Shortage Level 1 actions is up to 4,712 AF	The use of water for fire hydrants shall be limited to fire fighting and related activities necessary to maintain the public health, safety, and welfare. An exception may be made for construction use through proper city-designated meter. The use of poable water for construction activities shall be restricted in areas where recycled water is available for such use.	Yes
2	Other	Collective reduction from all Shortage Level 2 actions is up to 9,424 AF	Includes all Stage 1 actions	Yes
2	Other water feature or swimming pool restriction	Collective reduction from all Shortage Level 2 actions is up to 9,424 AF	Filling or refilling of empty swimming pools shall not occur without the written permission of the City Manager or his/her designee.	Yes
2	Landscape - Other landscape restriction or prohibition	Collective reduction from all Shortage Level 2 actions is up to 9,424 AF	All customers are prohibited from irrigating turf or ornamental landscapes during and within 48 hours following measurable rainfall.	Yes
2	CII - Lodging establishment must offer opt out of linen service	Collective reduction from all Shortage Level 2 actions is up to 9,424 AF		Yes
2	Landscape - Prohibit all landscape irrigation	Collective reduction from all Shortage Level 2 actions is up to 9,424 AF	All persons, including the City, are prohibited from irrigating with potable water any ornamental turf on public street medians.	Yes
2	Landscape - Other landscape restriction or prohibition	Collective reduction from all Shortage Level 2 actions is up to 9,424 AF	The use of potable water for irrigation outside of newly constructed homes and buildings shall be consistent with California Building Standards Commission and Department of Housing & Community Development.	Yes
3	Other	Collective reduction from all Shortage Level 3 actions is up to 14,137 AF	includes all Stage 2 actions	Yes
3	Landscape - Limit landscape irrigation to specific days	Collective reduction from all Shortage Level 3 actions is up to 14,137 AF	Residents and CII customers will be prohibited from irrigating any turf or landscape area more than four days a week.	Yes
3	Other - Prohibit use of potable water for construction and dust control	Collective reduction from all Shortage Level 3 actions is up to 14,137 AF	The use of water from fire hydrants shall be limited to fire fighting and related activities and other uses of water for municipal purposes shall be limited to activities necessary to maintain the public health, safety and welfare. Unless written permission has been granted by the CityManager or his/her designee, the use of potable water for construction activities and grading shall be prohibited.	Yes

4	Other	Collective reduction from all Shortage Level 4 actions is up to 18,849 AF	Includes all Stage 3 actions	Yes
4	Landscape - Limit landscape irrigation to specific days	Collective reduction from all Shortage Level 4 actions is up to 18,849 AF	Residents and CII customers will be prohibited from irrigating any turf or landscape area more than two days a week.	Yes
4	Landscape - Other landscape restriction or prohibition	Collective reduction from all Shortage Level 4 actions is up to 18,849 AF	No person shall irrigate any turf or landscaped area more than fifteen minutes (15) on watering days.	Yes
4	Other - Prohibit vehicle washing except at facilities using recycled or recirculating water	Collective reduction from all Shortage Level 4 actions is up to 18,849 AF		Yes
5	Other	Collective reduction from all Shortage Level 5 actions is up to 23,561 AF	Includes all Stage 4 actions	Yes
5	Landscape - Limit landscape irrigation to specific days	Collective reduction from all Shortage Level 5 actions is up to 23,561 AF	Residents and CII customers will be prohibited from irrigating any turf or landscape area more than one day a week.	Yes
6	Other	Collective reduction from all Shortage Level 6 actions is greater than 23,561 AF	Includes all Stage 5 actions	Yes
6	Landscape - Prohibit all landscape irrigation	Collective reduction from all Shortage Level 6 actions is greater than 23,561 AF	Commercial nurseries shall be prohibited from the use of potable water for irrigation of outdoor, landscape and turf except by use of a hand-held hose equipped with a positive shutoff nozzle.	Yes
6	Landscape - Other landscape restriction or prohibition	Collective reduction from all Shortage Level 6 actions is greater than 23,561 AF		Yes
6	Other water feature or swimming pool restriction	Collective reduction from all Shortage Level 6 actions is greater than 23,561 AF	The following nonessential uses of water shall be prohibited: the filling, cycling, filtering, or refilling swimming pools, spas, Jacuzzis, fountains or other like devices.	Yes
NOTES:				

8.4.2 SUPPLY AUGMENTATION

The City does not plan to add a new source of water supply to address customer demands, but instead will consider increased supplies from existing sources. Table 8-3 reflects this approach and does not identify any new supplies. Instead, the City will focus on demand reduction measures in the event existing sources of supply are not sufficient to meet customer demands. As discussed in Chapter 6, the City's sources of water supply include: groundwater pumped from the Chino Basin; treated groundwater from the Chino Basin produced by the Chino Basin Desalter Authority; treated, imported surface water purchased from MWD through Water Facilities Authority; groundwater and/or surface water purchased from San Antonio Water Company; and recycled water purchased from Inland Empire Utilities Agency. The City's main source of water supply is groundwater pumped from the Chino Basin. As noted in Section 8.2, beginning July 1, 2022, the City will prepare and submit an Annual Assessment which will include a review of water supplies available to meet water demands for the current and upcoming years. In the event the City is currently in, or considers entering into, one of the standard water shortage levels identified in Section 8.3, the City will consider the water supply augmentation actions described below.

For each water shortage level discussed in Section 8.3, the City will consider supplementing its existing water supplies through increased groundwater production instead of the purchase of additional imported water supplies. Due to previous critically dry conditions, MWD developed the Water Supply Allocation Plan whereby available supplies are equitably allocated to its member agencies, including CDA, IEUA, and WFA. The WSAP establishes ten different shortage levels and a corresponding drought allocation to each member agency. Based on the shortage level established by MWD, the WSAP provides a reduced drought allocation to a member agency for its Municipal and Industrial retail demand. The ratio of MWD water supply drought allocation to local water supply will change based on the WSAP stage. The MWD drought allocation can be used to make Full-Service water deliveries at the Tier 1 rate up to a Tier 1 allocation. Any Full-Service water delivered in excess of a drought allocation is subject to a penalty rate in addition to the normal rate paid for the water.

MWD's primary first response to any gap between core supplies (from the State Water Project and Colorado River) and demand is to make optimal use of its supply augmentation options, consisting of drawing from flexible supply programs and storage reserves. MWD has developed and actively manages a portfolio of water supply programs including water transfer, storage, and exchange agreements. MWD pursues voluntary water transfer and exchange programs to help mitigate supply/demand imbalances and provide additional dry-year supply sources. In addition, MWD has developed significant storage capacity in reservoirs, conjunctive use, and other groundwater storage programs totaling approximately 6.0 million AF. Pursuant to MWD's "Emergency Storage Objective", updated in 2019, approximately 750,000 AF of total stored water is emergency storage reserved by MWD for use in the event of supply interruptions. Based on MWD's historical and on-going water supply and storage programs and management practices, the City will use up to the treated imported water supply made available from MWD through WFA in association with each of the standard water shortage levels identified in Section 8.3. Water demands will be addressed through increased use of the local groundwater supplies and implementation of demand reduction measures through the various stages of action.

The City will consider augmenting its existing water supplies through production of additional groundwater from the Chino Basin. As noted in Section 6.2.2, the Chino Basin is managed under the Chino Basin adjudication. During the period of management under the Chino Basin Judgment, significant drought events have occurred. In each drought cycle the Chino Basin has been managed to maintain water levels. Parties to the Chino Basin Judgment, including the City, are authorized to produce groundwater in excess of their rights and pay assessments for such production to the Chino Basin Watermaster. The assessments are used to purchase untreated imported water to replenish the Chino Basin. The Chino Basin Watermaster purchases untreated imported water to replenish the Chino Basin from MWD through Inland Empire Utilities Agency. Groundwater quality is carefully monitored by the Chino Basin Watermaster. Treatment facilities and/or blend plans have been developed by water agencies to meet potable water standards and to prevent the spread of any groundwater contamination. Groundwater quality in the Chino Basin is not expected to impact potable supplies or constrain supply reliability. Based on historical and on-going management practices, the City will be able to continue relying on the Chino Basin for adequate supplies in response to each of the standard water shortage levels identified in Section 8.3.

5	Transfers	Not applicable (see Notes)	
6	Transfers	Not applicable (see Notes)	
NOTES: The City will consider increased production from the Chino Basin using existing facilities to address increased demands. As noted on Table 8-2, the City plans to implement demand reduction measures in the event water supplies from existing sources are not sufficient to meet anticipated demands.			

8.4.3 OPERATIONAL CHANGES

During a water supply shortage situation, the City will manage its water supply resources to provide sufficient water supplies capable of meeting the demands of its customers. Section 8.4.1 describes the City's standard water shortage levels and associated demand reduction measures. Section 8.4.2 describes the City's water supply sources and water supply augmentation actions available. The supply augmentation actions and demand reduction measures, when implemented, may potentially result in short-term operational changes which are necessary to allow the City to utilize all available water supply sources in response to water shortage situations.

As noted in Section 8.2, beginning July 1, 2022, the City will prepare and submit an Annual Assessment which will include a review of the water supplies available to meet water demands for the current and upcoming years. Preparation of the Annual Assessment will assist the City in determining any potential operational changes. In addition, the City's standard water shortage levels and the associated demand reduction measures, in conjunction with the City's existing Demand Management Measures (discussed in Chapter 9), will be essential to the City in reducing water demands during any water shortage period. The operational changes the City will consider in addressing non-catastrophic water shortages on a short-term basis include the following:

- Improved monitoring, analysis, and tracking of customer water usage to enforce demand reduction measures
- Optimized production from existing available water supply sources
- Potential use of emergency supply sources, including emergency interconnections
- Potential blending of water supply resources
- Improved monitoring, maintenance, and repairs to reduce water distribution system losses

8.4.4 ADDITIONAL MANDATORY RESTRICTIONS

The mandatory restrictions which are implemented by the City to reduce customer demands are discussed in Section 8.4.2. There are no additional mandatory restrictions planned at this time.

8.4.5 EMERGENCY RESPONSE PLAN

Catastrophic water shortages are incorporated in the City's standard water shortage levels (identified in Section 8.3) and the associated demand reduction measures (described in Section 8.4.2). In addition to the water supply augmentation actions (Section 8.4.1) and potential operational changes (Section 8.4.3) which the City may consider in order to continue providing sufficient water supplies, the City will review and implement any necessary steps included in its "Emergency Response Plan".

As part of the "America's Water Infrastructure Act of 2018", community water systems serving a population greater than 3,300 people, including the City, are required to review and update their "Risk and Resilience Assessment" (RRA) and the associated "Emergency Response Plan" (ERP) every five (5) years. However, due to security concerns regarding the submitting of these reports, water systems are required to submit certifications to the United States Environment Protection Agency (USEPA), from March 31, 2020 and December 30, 2021, confirming the current RRA and ERP have been reviewed and updated.

The City's RRA, prepared in May 2020, evaluates the vulnerabilities, threats, and consequences from potential hazards to the City's water system. The City prepared its RRA (which is incorporated by reference) by evaluating the following items:

- Natural hazards and malevolent acts (i.e., all hazards);
- Resilience of water facility infrastructure (including pipes, physical barriers, water sources and collection, treatment, storage and distribution facilities, and electronic, computer and other automated systems);
- Monitoring practices;
- Financial systems (e.g., billing systems);
- Chemical storage and handling; and
- Operation and maintenance.

The District's RRA evaluated a series of potential malevolent acts, natural hazards, and other threats in order to estimate the potential "monetized risks" (i.e. associated economic consequences to both the water system and surrounding region, and the likelihood of occurrence) associated with the City's water facility assets. The cost-effectiveness of implementing potential countermeasures to reduce risks was also reviewed.

The City's ERP, prepared in September 2020, provides the management, procedures, and designated actions the City and its employees will implement during emergency situations (including catastrophic water shortages) resulting from natural disasters, system failures and other unforeseen circumstances. The City's ERP (which is incorporated by reference) provides the guidelines for evaluating an emergency situation, procedures for activating an emergency response, and details of the different response phases in order to ensure that customers receive a reliable and adequate supply of potable water. The scope of the ERP includes emergencies which directly affect the water system and the ability to maintain safe operations (such as a chlorine release, and earthquake or a threat of contamination). The ERP also incorporates the results of City's RRA and includes the following:

- Strategies and resources to improve resilience, including physical and cybersecurity
- Plans and procedures for responding to a natural hazard or malevolent act
- Actions and equipment to lessen the impact of a natural hazard or malevolent act
- Strategies to detect natural hazards or malevolent act

The City will review the ERP for procedures regarding the utilization of alternative water supply sources in response to water supply shortages, including during the standard water shortage levels. The City will also review applicable procedures described in the ERP regarding any necessary temporary shutdown of water supply facilities, including appropriate regulatory and public notifications.

8.4.6 SEISMIC RISK ASSESSMENT AND MITIGATION PLAN

CWC 10632.5.

(a) In addition to the requirements of paragraph (3) of subdivision (a) of Section 10632, beginning January 1, 2020, the plan shall include a seismic risk assessment and mitigation plan to assess the vulnerability of each of the various facilities of a water system and mitigate those vulnerabilities.

(b) An urban water supplier shall update the seismic risk assessment and mitigation plan when updating its urban water management plan as required by Section 10621.

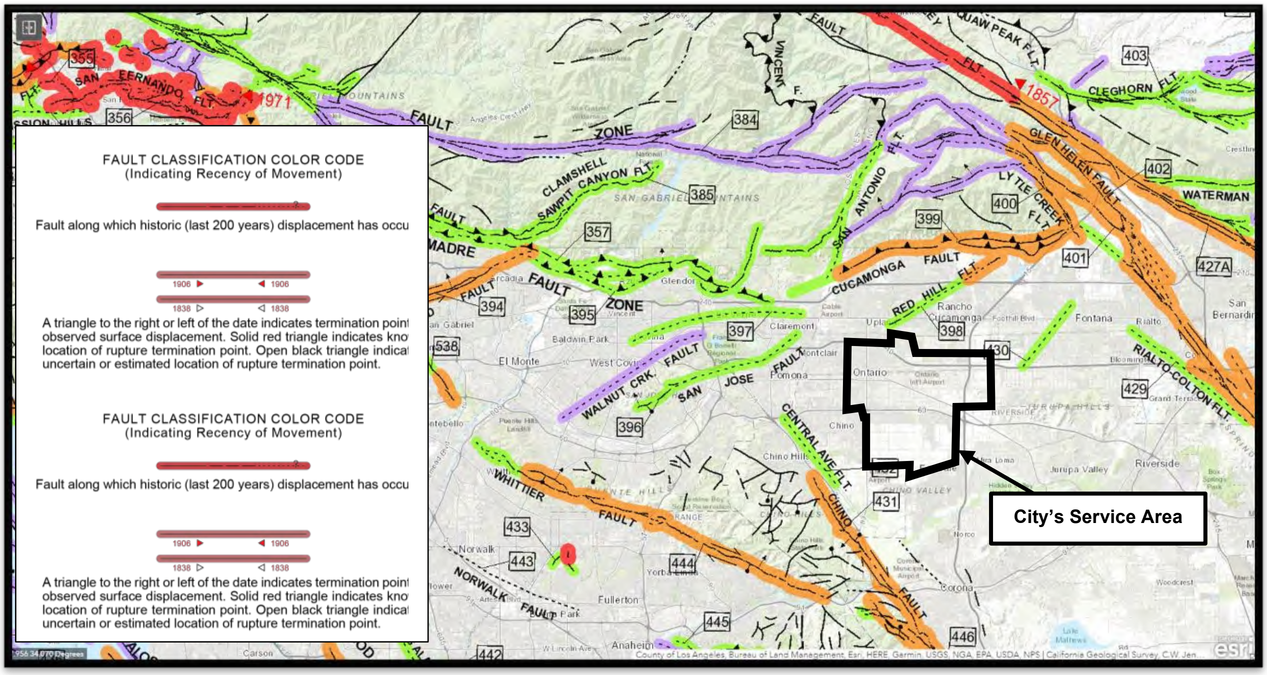
(c) An urban water supplier may comply with this section by submitting, pursuant to Section 10644, a copy of the most recent adopted local hazard mitigation plan or multihazard mitigation plan under the federal Disaster Mitigation Act of 2000 (Public Law 106-390) if the local hazard mitigation plan or multihazard mitigation plan addresses seismic risk.

The City prepared a local "Hazard Mitigation Plan" which was approved by the Federal Emergency Management Agency (FEMA) in 2018. The Hazard Mitigation Plan identifies effective ways to assess the significant natural hazards (including earthquakes) that may affect the City and its residents. The Hazard Mitigation Plan provides resources, information, and strategies to reduce the City's vulnerability to these hazards, while providing guidance for the coordination of mitigation activities throughout the City. The Hazard Mitigation Plan includes mitigation projects necessary to reduce seismic risk to the City's water distribution system facilities (including its distribution system pipelines, groundwater wells, booster pumps, and storage reservoirs) and potential disruptions in providing water service. The City's Hazard Mitigation Plan is provided in Appendix O.

The County of San Bernardino prepared a "Multi-Jurisdictional Hazard Mitigation Plan" which was approved by the Federal Emergency Management Agency in June 2017. The County's Multi-Jurisdictional Hazard Mitigation Plan identified methods to assess significant natural hazards (including earthquakes) affecting areas throughout San Bernardino County, and the mitigation strategies necessary to reduce risks, including seismic risk. The County's Multi-Jurisdictional Hazard Mitigation Plan is provided in Appendix P.

The California Geological Survey has published the locations of numerous faults which have been mapped in the Southern California region. Although the San Andreas fault is the most recognized and is capable of producing an earthquake with a magnitude greater than 8 on the Richter scale, some of the lesser-known faults have the potential to cause significant damage. The locations of these earthquake faults in the vicinity of the City's water service area are provided in the Figure 6 below. The faults that are located in close proximity to and could potentially cause significant shaking in the City's water service area include the San Andreas fault, the Walnut Creek fault, the San Jose fault, the Red Hill fault, the Cucamonga fault, the Chino fault, the Rialto-Colton fault and the Central Avenue fault. As discussed in Section 6.2.2, the faults which border the Chino Basin include the Rialto-Colton fault, the Chino fault, the San Jose fault, and the Cucamonga fault.

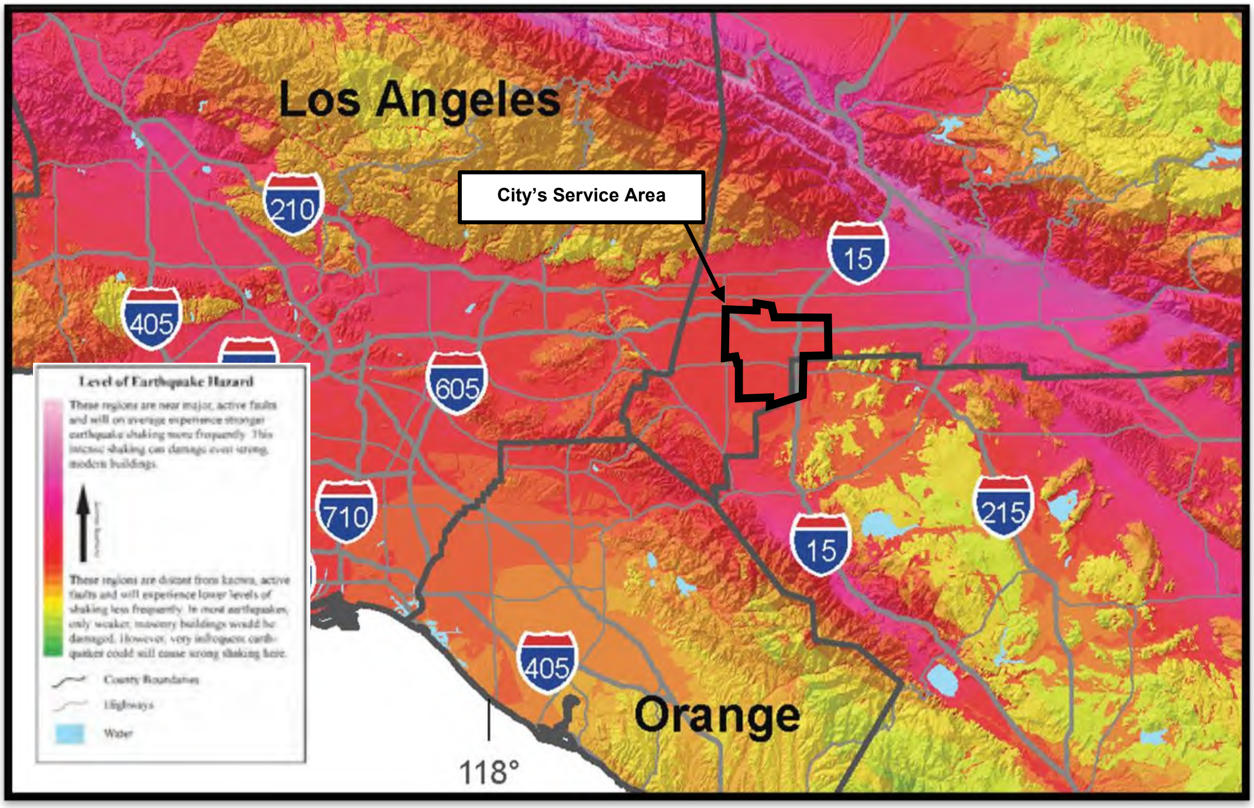
Figure 6 - Location of Earthquake Faults



Source: https://maps.conservation.ca.gov/cgs/fam/App/

The following Figure 7 provides the relative intensity of ground shaking in the vicinity of the City's service area from anticipated future earthquakes. The locations of relatively long-period (1.0 second) earthquake shaking, including the City's service area, are provided. Long-period shaking affects tall, relatively flexible buildings, but also correlates with earthquake damage. The shaking potential is calculated based on the level of ground motion that has a 2 percent chance of being exceeded in 50 years (or the level of ground-shaking with an approximate 2,500-year average repeat time). As discussed in Section 8.4.5, the City has prepared an Emergency Response Plan which provides the management, procedures, and designated actions the City and its employees will implement during emergency situations resulting from natural disasters, including during earthquakes, to ensure that customers receive a reliable and adequate supply of potable water. The City's ERP is incorporated by reference.

Figure 7 - Earthquake Shaking Potential



Source: "Earthquake Shaking Potential for California", 2016, California Geological Survey and United States Geological Survey

8.4.7 SHORTAGE RESPONSE ACTION EFFECTIVENESS

The effectiveness of the shortage response actions for each of the standard water shortage levels identified in Section 8.3, is evident in the City's historical ability to meet its customer's water demands in response to a water supply shortage. In addition, the City imposes water consumption regulations and restrictions, and supports local agencies in efforts to enforce regulations and prohibitions on water use. The effectiveness of each of the City's shortage response actions, in order to reduce any potential gaps between supply and demand, has been quantified in the expected demand reduction provided in Table 8-2 and Table 8-3.

Section 6.1 provides a tabulation of the City's historical annual water demands for each water supply source. During the past 10 years, the City experienced a five-year consecutive drought within its service area from FY 2011-12 to FY 2015-16. Throughout this extended dry year period, the City's annual water production ranged from 36,036 AF to 45,196 AF, with an average of approximately 41,558 AF. In addition, historical records indicate the City previously produced a maximum of up to 45,196 AF during FY 2013-14. The City has been able to provide sufficient water supplies to its customers, including during long-term droughts and years with historically high water demands. In addition, the City has been able to provide water service to meet maximum day water demands for these years, including during the summer months.

The City's water demands during the most recent five years (from FY 2015-16 to FY 2019-20) averaged approximately 39,374 AFY. Due to conservation efforts and demand management measures (discussed in Chapter 9), the City's recent water demands have been less than its historical water demands, including during long-term droughts. The City's projected water demands (during normal, single dry, and multiple dry years) are provided in Section 7.2.3 and are anticipated to incorporate similar reductions in water use rates as a result of the shortage response actions, ongoing conservation efforts, and demand management measures. Because the City's projected water rates are similar to its historical water use rates, it is anticipated the City will be able to continue providing sufficient water supplies to its customers to meet projected water demands, including during long-term droughts. In addition, as discussed in Section 8.4.1, based on historical and on-going management practices, the City will be able to continue relying on its water supply source from the Chino Basin for adequate supply augmentation in response to each of the standard water shortage levels identified in Section 8.3.

Based on the City's demonstrated ability to meet water demands during past water supply shortages, the adopted water shortage levels, the adjusted operating safe yields, and water supplies during long-term droughts, it is anticipated that the City will be able to provide sufficient water supplies to its customers during each of its standard water shortage levels. Although adequate supplies are anticipated, the cost of those water supplies may become incrementally more expensive. The City will enact varying stages of its WSCP to encourage retail customers to reduce water consumption and at the same time reduce the need to use the more expensive water supplies. Notwithstanding, the effectiveness of each of the City's shortage response actions, in order to reduce any potential gaps between supply and demand, has been quantified in the expected demand reduction section provided in Table 8-2 and Table 8-3. The effectiveness of the City's shortage response actions is based on the City's water demands prior to 2015 (unconstrained demands). The City reduced its water demands in 2015 in response to the Governor's April 1, 2015 Executive Order B-29-15 which mandated statewide reduction in water use of 25 percent. The City's actual water demand reduction during this period was used to estimate the extent of water use reductions for the City's Water Shortage Stages. The City's Water Shortage Stages 1, 2, 3, 4, 5, and 6 are expected to reduce water demands by up to 10%, 20%, 30%, 40%, 50%, and greater than 50%, respectively.

8.5 COMMUNICATION PROTOCOLS

CWC 10632.

(a)(5) Communication protocols and procedures to inform customers, the public, interested parties, and local, regional, and state governments, regarding, at a minimum, all of the following:

(A) Any current or predicted shortages as determined by the annual water supply and demand assessment described pursuant to Section 10632.1.

(B) Any shortage response actions triggered or anticipated to be triggered by the annual water supply and demand assessment described pursuant to Section 10632.1.

(C) Any other relevant communications.

Upon finding that a need to implement a Stage 1 through Stage 6 Water Supply Shortage exists, the City Council will order implementation of the appropriate water shortage response action, or other measures which it deems appropriate to address the water shortage. This order shall be made by Resolution and will be published in a daily newspaper of general circulation and will become effective immediately following publication. The appropriate regulations that fall under the Stage Level declared will take effect with the first full billing period commencing on or after the effective date of the City Council's Resolution.

In the event of an immediate emergency that causes an unplanned interruption of water supply, the City Manager or his/her designee is authorized to restrict water use and apportion the available supply of water among its customers in the most equitable manner possible to continue service fairly and without discrimination, except that preference shall be given to such service as is essential to the public interest and to the preservation of life and health.

8.6 COMPLIANCE AND ENFORCEMENT

CWC 10632.

(a)(6) For an urban retail water supplier, customer compliance, enforcement, appeal, and exemption procedures for triggered shortage response actions as determined pursuant to Section 10632.2.

The City's WSCP includes fines and penalties that may be imposed on any customer who fails to comply with the prohibitions and restrictions of each water supply shortage stage. All fines and penalties may apply to each of the prohibitions and restrictions of each water supply shortage stage. If a customer if found to be in violation of any water supply shortage stage provision, fines begin with a written notice and subsequent violations include fines of $100, $200, and $500.

8.7 LEGAL AUTHORITIES

CWC 10632.

(a)(7)(A) A description of the legal authorities that empower the urban water supplier to implement and enforce its shortage response actions specified in paragraph (4) that may include, but are not limited to, statutory authorities, ordinances, resolutions, and contract provisions.

(B) A statement that an urban water supplier shall declare a water shortage emergency in accordance with Chapter 3 (commencing with Section 350) of Division 1.

(C) A statement that an urban water supplier shall coordinate with any city or county within which it provides water supply services for the possible proclamation of a local emergency, as defined in Section 8558 of the Government Code.

CWC Division 1, Section 350

The governing body of a distributor of a public water supply, whether publicly or privately owned and including a mutual water company, shall declare a water shortage emergency condition to prevail within the area served by such distributor whenever it finds and determines that the ordinary demands and requirements of water consumers cannot be satisfied without depleting the water supply of the distributor to the extent that there would be insufficient water for human consumption, sanitation, and fire protection.

The City has the legal authority to implement and enforce its water shortage contingency plan. California Constitution article X, section 2 and California Water Code section 100 provide that water must be put to beneficial use, the waste or unreasonable use or unreasonable method of use of water shall be prevented, and the conservation of water is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and the public welfare. In addition, CWC Section 375 provides the City with the statutory authority to adopt and enforce water conservation restrictions, and CWC Section 350 et seq. authorizes the City to declare a water shortage emergency and impose water conservation measures when it determines that the City may not be able to satisfy ordinary demands without depleting supplies to an insufficient level. If necessary, the City shall declare a water shortage emergency in according with CWC Chapter 3 (commencing with Section 350) of Division 1. Once having declared a water shortage, the City is provided with broad powers to implement and enforce regulations and restrictions for managing a water shortage. For example: CWC section 375(a) provides:

> Notwithstanding any other provision of the law, any public entity which supplies water at retail or wholesale for the benefit of persons within the service area or area of jurisdiction of the public entity may, by ordinance or resolution adopted by a majority of the members of the governing body after holding a public hearing upon notice and making appropriate findings of necessity for the adoption of a water conservation program, adopt and enforce a water conservation program to reduce the quantity of water used by those persons for the purpose of conserving the water supplies of the public entity.

(CWC Section 375(a).) CWC Section 375(b) grants the City with the authority to set prices to encourage water conservation.

Pursuant to these authorities, the City adopted Ordinance No. 3027. Under the City's Ordinance No. 3027, a water shortage, including a water shortage emergency but excluding an immediate emergency, shall be declared by the adoption of a resolution of the City Council, in accordance with CWC section 350. The City Council may declare a water shortage based on a determination by the MWD and the IEUA of a water shortage, the declaration of an executive order of the Governor or the adoption of voluntary or mandatory water use restrictions by any State Agency governing the use of water or based upon any interruption in water supply or delivery that the City Council determines in its sole discretion necessitates water conservation pursuant to this chapter.

Under California law, including CWC Chapters 3.3 and 3.5 of Division 1, Parts 2.55 and 2.6 of Division 6, Division 13, and Article X, Section 2 of the California Constitution, the City is authorized to implement the water shortage actions outlined in this WSCP and in the City's Ordinance No. 3027. In water shortage cases, shortage response actions to be implemented will be at the discretion of the City and will be based on an assessment of the supply shortage, customer response, and need for demand reductions as outlined in this WSCP and the City's Ordinance No. 3027.

It is noted that upon proclamation by the Governor of a state of emergency under the California Emergency Services Act (Chapter 7 (commencing with Section 8550) of Division 1 of Title 2 of the Government Code) based on drought conditions, the state will defer to implementation of locally adopted water shortage contingency plans to the extent practicable.

The City will coordinate with the County and any other entities as necessary for possible proclamation of a local emergency as necessary under California Government Code, California Emergency Services Act (Article 2, Section 8558).

In the event of an immediate emergency that causes an unplanned interruption of water supply, the City Manager or his/her designee is authorized to restrict water use and apportion the available supply of water among its customers in the most equitable manner possible to continue service fairly and without discrimination, except that preference will be given to such service as is essential to the public interest and to the preservation of life and health.

At any time during Stage 1, 2, 3, 4, 5, or 6, if the City Council determines that additional reductions in the amount the potable water being used by water customers are necessary, it may adopt a resolution establishing water use limitations and enforce those water use limitations by the adoption and imposition of a volumetric penalty established therein.

8.8 FINANCIAL CONSEQUENCES OF WSCP

CWC 10632.

(a)(8) A description of the financial consequences of, and responses for, drought conditions, including, but not limited to, all of the following:

(A) A description of potential revenue reductions and expense increases associated with activated shortage response actions described in paragraph (4).

(B) A description of mitigation actions needed to address revenue reductions and expense increases associated with activated shortage response actions described in paragraph (4).

(C) A description of the cost of compliance with Chapter 3.3 (commencing with Section 365) of Division 1.

Potential revenue reductions and expense increases associated with activated shortage response actions are regulated and tracked by the City's financial department.

During periods of water supply shortages, state-mandated water use restrictions, or emergency conditions, the City may require its customers to reduce demands below levels projected under the current water rate structure. Under any of these circumstances, the City may experience a decrease in revenues. In order to offset any decline in revenues, the City Council may adopt resolutions to make additional adjustments to the water rates based on the City's increased costs to provide water to its customers.

Projected demands, water supply reductions, water rates and cost of water cannot be known with certainty. However, even under a hypothetical scenario whereby sales are gradually reduced by up to 50 percent, certain actions are known as noted below:

Water supplies:

- CDA supplies will not be impacted from a quantity or cost standpoint.
- As demands/sales are reduced, the City will rely on its least expensive sources of supply first and sequentially reduce the most expensive sources of water supply (i.e. imported water). This action will address much of the gap between reduced revenue from water sales and the cost of the water supplies.
- As sales are reduced, distribution system losses will also be reduced on a proportional basis resulting in savings by not having to provide as much water.

Revenue from water sales:

Revenue from the monthly standby charge to each retail customer will remain constant regardless of the volume of water sold.

The City will regularly track the impacts of potentially reduced water sales on revenue and compare it to the cost of operations. In the event that the City's revenues and expenditures are severely affected by a water shortage, the following measures could be taken by the City to alleviate the financial impacts before there has been a significant draw on financial reserves:

- Rate Adjustment
- Decrease in Capital Expenditure
- Decrease in O&M Expenditure

Rate increases are not viewed positively by the customers particularly when they reduce consumption. Negative consequences that could arise from the cost-cutting actions include dissatisfaction of the customers, reduced funding for Capital Improvement Projects and system maintenance, and reduced staff availability for emergency response. Nonetheless, these tools are available to the City in a worst-case scenario to ensure a constant balance between revenue and expenses.

8.9 MONITORING AND REPORTING

CWC 10632.

(a)(9) For an urban retail water supplier, monitoring and reporting requirements and procedures that ensure appropriate data is collected, tracked, and analyzed for purposes of monitoring customer compliance and to meet state reporting requirements.

Customer compliance of the provisions adopted by declaration of a WSCP are monitored and reported through water loss audits performed by the City's Utilities Department. Staff prepares annual Distribution System Water Audits to monitor water losses. Staff reviews the audits to track real and apparent losses. Losses are monitored by comparing water production to sales. The City regularly monitors its system and repairs leaks in a timely manner. This includes regular checks on valves and meters, and pipeline maintenance. If leaks are encountered or suspected during routine inspection of the system, further evaluation is conducted. If leaks are found, they are repaired.

8.10 WSCP REFINEMENT PROCEDURES

CWC 10632.

(a)(10) Reevaluation and improvement procedures for systematically monitoring and evaluating the functionality of the water shortage contingency plan in order to ensure shortage risk tolerance is adequate and appropriate water shortage mitigation strategies are implemented as needed.

The City's WSCP has been prepared as an adaptive management plan. As discussed in Section 8.9, the City will monitor and report on the implementation of the WSCP. The City will review the implementation results for any current or potential shortage gaps between water supplies and demands. The City will evaluate the need for revising the WSCP in order to resolve any shortage gaps, as necessary. The City will consider the following potential revisions in the event of a potential shortage gap:

- Implementation of additional public outreach, education, and communication programs (in addition to the programs discussed in Chapter 9).
- Implementation of more stringent water use restrictions under the standard water shortage levels (discussed in Section 8.4.1).
- Implementation of stricter enforcement actions and penalties (discussed in Section 8.6).
- Improvements to the water supply augmentation responses (discussed in Section 8.4.2), as well as any associated operational changes (discussed in Section 8.4.3) which may be required.
- Incorporation of additional actions recommended by City staff or other interested parties.

The City will use the monitoring and reporting data to evaluate the ability for these potential revisions to resolve any shortage gaps which may occur within the standard water shortage levels.

The WSCP is adopted as part of the City's 2020 Urban Water Management Plan adoption process discussed in Section 10.3. It is anticipated the City will review, revise, and adopt an updated WSCP as part of preparing its 2025 Urban Water Management Plan as necessary. However, the City will continue to review the monitoring and reporting data, and if needed, update the WSCP more frequently. Any updates to the City's WSCP will include a public hearing and adoption process by the City Council (see Section 8.12).

8.11 SPECIAL WATER FEATURE DISTINCTION

CWC 10632.

(b) For purposes of developing the water shortage contingency plan pursuant to subdivision (a), an urban water supplier shall analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas, as defined in subdivision (a) of Section 115921 of the Health and Safety Code.

The City's WSCP defines "decorative water features" as water features which are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, but excluding pools and spas. In general, there are additional health and safety considerations in the water supplied to pools and spas compared to decorative water features. As a result, the City's WSCP has reviewed the response actions, enforcement actions, and monitoring and reporting programs separately for decorative water features and for pools and spas, as applicable.

As described in Section 8.4.1, under a Stage 1 Water Supply Shortage Level, no water shall be used to clean, fill or maintain levels in decorative fountains, ponds, lakes or other similar aesthetic structures unless such water is part of a recycling system.

8.12 PLAN ADOPTION, SUBMITTAL, AND AVAILABILITY

CWC 10632.

(c) The urban water supplier shall make available the water shortage contingency plan prepared pursuant to this article to its customers and any city or county within which it provides water supplies no later than 30 days after adoption of the water shortage contingency plan.

The City's WSCP is adopted as part of the City's 2020 Urban Water Management Plan adoption process discussed in Chapter 10. The process for adopting the City's WSCP includes the following:

- The City will conduct a public hearing and make the WSCP available for public inspection.
- The City will provide notification of the time and place of the public hearing to any city or county in which water is provided.
- The City will publish notice of public hearing in a newspaper once a week, for two successive weeks (with at least five days between publication dates).
- The City Council will adopt the 2020 Urban Water Management Plan and the WSCP.
- As part of submitting the 2020 Urban Water Management Plan to DWR, the City will also submit the WSCP (electronically through DWR's online submittal tool) within 30 days of adoption and by July 1, 2021. The City will submit a copy of the WSCP to the California State Library and to any city or county in which water is provided within 30 days of adoption. In addition, the City will make the WSCP available for public review within 30 days of adoption.

If there are any subsequent amendments required, the process for adopting an amended WSCP includes the following:

- The City will conduct a public hearing and make the amended WSCP available for public inspection via public City Council agendas.
- The City Council will adopt the amended WSCP.
- The City will submit the amended WSCP to DWR (electronically through DWR's online submittal tool) within 30 days of adoption.

Additional information regarding the adoption, submittal, and availability of the City's WSCP (and 2020 Urban Water Management Plan) is provided in Chapter 10.

Chapter 9

DEMAND MANAGEMENT MEASURES

LAY DESCRIPTION – CHAPTER 9

DEMAND MANAGEMENT MEASURES

Chapter 9 (Demand Management Measures) of the City's 2020 Plan discusses and provides the following:

- The City has implemented "Demand Management Measures" to reduce its water demands and achieve its water use targets (discussed in Chapter 5)
- The City's Demand Management Measures include adoption of an ordinance to prevent water waste.
- The City's Demand Management Measures include metering of all customer connections, including separate metering for single-family residential, commercial, industrial, large landscape and institutional/governmental facilities.
- The City's Demand Management Measures include conservation pricing. The City's current water rate structure is tiered to promote water conservation by customers.
- The City's Demand Management Measures include public education and outreach programs regarding water conservation.
- The City's Demand Management Measures include various actions to assess and manage water distribution system losses.
- Additional Demand Management Measures including rebate, conservation, and educational programs are discussed.
- A summary of the Demand Management Measures the City has implemented over the past five (5) years is provided. The City met the 2020 Water Use Target (discussed in Chapter 5) through the implementation of these Demand Management Measures.

9.1 DEMAND MANAGEMENT MEASURES FOR WHOLESALE SUPPLIERS

CWC 10631.

(e) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1)(B) The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:

(ii) Metering.

(iv) Public education and outreach.
(vi) Water conservation program coordination and staffing support.

(vii) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.

(2) For an urban wholesale water supplier, as defined in Section 10608.12, a narrative description of the items in clauses (ii), (iv), (vi), and (vii) of subparagraph (B) of paragraph (1), and a narrative description of its distribution system asset management and wholesale supplier assistance programs.

9.1.1 METERING

The City is not a wholesale agency and is not required by DWR to complete Section 9.1.

9.2 EXISTING DEMAND MANAGEMENT MEASURES FOR RETAIL SUPPLIERS

CWC 10631.

(e) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1)(A) For an urban retail water supplier, as defined in Section 10608.12, a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years. The narrative shall describe the water demand management measures that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.

(B) The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:

(i) Water waste prevention ordinances.

(ii) Metering.

(iii) Conservation pricing.

(iv) Public education and outreach.

(v) Programs to assess and manage distribution system real loss.

(vi) Water conservation program coordination and staffing support.

(vii) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.

9.2.1 WATER WASTE PREVENTION ORDINANCES

Waste is defined as any excessive, unnecessary or unwarranted use of water, including but not limited to any use which causes unnecessary runoff beyond the boundaries of any property as served by its meter and any failure to repair as soon as reasonably possible any leak or rupture in any water pipes, faucets, valves, plumbing fixtures or other water service appliances. The City adopted Ordinance No. 3027 in October 2015 to establish water conservation measures, staged water supply shortage demand management measures (DMMs), and prevent water waste. The adoption of Ordinance No. 3027 was part of a comprehensive water shortage planning effort to manage the City's response to any water supply challenges it may encounter. The City will review and update as necessary when DWR publishes urban water use targets for its service area in accordance with SB 606 and AB 1668 regulations.

9.2.2 METERING

CWC 526.

(a) Notwithstanding any other provision of law, an urban water supplier that, on or after January 1, 2004, receives water from the federal Central Valley Project under a water service contract or subcontract… shall do both of the following:

(1) On or before January 1, 2013, install water meters on all service connections to residential and nonagricultural commercial buildings… located within its service area.

CWC 527.

(a) An urban water supplier that is not subject to Section 526 shall do both of the following:

(1) Install water meters on all municipal and industrial service connections located within its service area on or before January 1, 2025.

The City meters all customer connections, including separate metering for single-family residential, commercial, industrial, large landscape and institutional/governmental facilities. Furthermore, if there is new development within the City, each facility is individually metered.

Service charges for the city are based on the customers' connection size. Further information regarding the City's service fees and conservation pricing is provided in Section 9.2.3.

9.2.3 CONSERVATION PRICING

The City has two commodity rates (Budgeted Use and Drought Surcharge) for water for customers within its service area. A Readiness-to-Serve Charge is added to the commodity rates to comprise the total water bill and is based on the size of the meter. Water bills are sent out monthly. A water rate sheet showing current rates is provided in Appendix Q.

The City's current water rate structure is tiered to promote water conservation by customers. The water rates have been developed to fund the cost of water and are related to the overall cost of water service. In the event the customer uses more than the amount of water allotted for the budgeted allocation, a Drought Surcharge rate would apply. The Drought Surcharge rate essentially penalizes the customers for over usage of water. This applies to all water-use sectors (e.g., single family residential, multifamily residential, industrial, institutional, etc.). Therefore, there is an economic benefit to conserving water.

9.2.4 PUBLIC EDUCATION AND OUTREACH

The City developed a public information program to educate the public to the benefits of water conservation. The program involves the dissemination of information through literature provided at City Hall and other City of Ontario facilities, and articles in the City of Ontario newsletter. The City includes informational flyers with the water bills periodically to address water conservation and other important matters. The City periodically holds public seminars and workshops with other local agencies to promote water conservation. The City also provides water conservation information and updates on its website. The City will continue these programs to promote water conservation.

As part of a public outreach program for water conservation, City representatives have visited schools to discuss water conservation. This discussion is usually included as part of an overall presentation on the water system and how it works. The City will continue the school education programs to promote water conservation to that sector of the community.

9.2.5 PROGRAMS TO ASSESS AND MANAGE DISTRIBUTION SYSTEM REAL LOSS

The City's system is comprised mainly of single and multi-family dwellings. The City estimates water system losses at approximately 2.9 percent, as discussed in Section 4.2. The City has water conservation literature that alerts customers to be on the lookout for water system leaks and to correct them promptly. The City is available to assist customers in answering questions regarding system leaks or higher than expected water usage.

As a part of normal operation and maintenance of the water system, City staff does preventive maintenance. This includes regular checks on valves and meters, and pipeline maintenance. If leaks are encountered or suspected during routine inspection of the system, further evaluation is conducted. If leaks are found, they are repaired.

The City monitors the water system for loss by comparing water production to water sales. The City will continue to monitor the water system for water loss, and if a trend develops to indicate that further analyses are required, the City will provide the necessary funds to institute another leak detection program.

The City will continue these programs to assess and manage distribution system real losses.

9.2.6 WATER CONSERVATION PROGRAM COORDINATION AND STAFFING SUPPORT

Various City departments are involved in the water conservation program. These include maintenance and operations personnel, the Utilities General Manager, the Public Works Director, and administrative staff who answer billing and usage questions and serve at the front counter at City Hall. In addition, the City employs a full time Water Resources Coordinator to oversee all water conservation activities. The Water Resources Coordinator is responsible for all matters pertaining to the City's water conservation program including implementation of DMMs. The City plans to continue to provide water conservation program coordination and staffing support.

9.2.7 OTHER DEMAND MANAGEMENT MEASURES

Large Landscape Conservation Programs
The City routinely hosts seminars and workshops in the community to promote landscape conservation. The City continues to offer a rebate program for the purchase of landscape related items to both residential and commercial customers to promote water conservation. During FY 2015-16 through FY 2019-20, the City provided rebates for this program.

Rebate Programs
The City continues to offer a rebate program for the purchase of high-efficiency washing machines, high-efficiency toilets, and weather-based irrigation controllers to customers to promote water conservation. The City currently offers rebates to qualifying customers for high-efficiency washing machines, high-efficiency toilets, and weather-based irrigation controllers. The rebate application, along with a list of qualifying appliances, are listed on the City's website. During FY 2015-16 through FY 2019-20, the City provided rebates for this program.

The City plans to continue implementation of the programs described above to promote water conservation.

9.3 REPORTING IMPLEMENTATION

9.3.1 IMPLEMENTATION OVER THE PAST FIVE YEARS

CWC 10631.

(e) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1) (A) ...a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years.

The City is committed to implementing water conservation programs. The highlights of DMM implementation over the past five years are described below.

As discussed in Section 9.2.1, in October 2015, the City adopted Ordinance No. 3027 to establish water conservation measures and staged water supply shortage demand management measures.

As discussed in Section 9.2.2, the City metered all customer connections, including separate metering for single-family residential, commercial, industrial, large landscape and institutional/governmental facilities during the past five years. Furthermore, if there was new development within the City, each facility was individually metered. Service charges for the City are based on the customers' connection size.

As discussed in Section 9.2.3, the City has two commodity rates (Budgeted Use and Drought Surcharge) for water for customers within its service area. Readiness-to-Serve Charges are added to the commodity rates to comprise the total water bill and are based on the size of the meter. Water bills are sent out monthly. A water rate sheet showing current rates is provided in Appendix Q.

As discussed in Section 9.2.4, the City developed a public information program to educate the public to the benefits of water conservation. The program involves the dissemination of information through literature provided at City Hall and other City of Ontario facilities, and articles in the City of Ontario newsletter. The City included informational flyers with the water bills periodically to address water conservation and other important matters. The City periodically held public seminars and workshops with other local agencies to promote water conservation. The City also provided water conservation information and updates on its website. As part of a public outreach program for water conservation, City representatives visited schools to discuss water conservation. The City coordinated and/or participated in public education/outreach events from FY 2015-16 through FY 2019-20.

As discussed in Section 9.2.5, the City distributed water conservation literature that alerted customers to be on the lookout for water system leaks and to correct them promptly.

As a part of normal operation and maintenance of the water system, City staff performed preventive maintenance. This included regular checks on valves and meters, and pipeline maintenance. The City monitored the water system for losses by comparing water production to water sales.

As described in Section 9.2.6, the City employed a full time Water Resources Coordinator to oversee all water conservation activities from FY 2015-16 through FY 2019-20. The Water Resources Coordinator is responsible for all matters pertaining to the City's water conservation program including implementation of DMMs. The City plans to continue to provide water conservation program coordination and staffing support.

Other DMMs employed by the City are discussed in Section 9.2.7. Highlights of other DMM implementation over the past five years are described below.

- Landscape Conservation Program – During FY 2015-16 through FY 2019-20, the City routinely hosted seminars and workshops in the community to promote landscape conservation. The City also offered a rebate program for the purchase of landscape related items to both residential and commercial customers to promote water conservation.
- High Efficiency Clothes Washing Machine Rebate Program – The City distributed high efficiency washing machine rebates from FY 2015-16 through FY 2019-20.
- High Efficiency Toilet Rebate Program – The City distributed high efficiency toilet rebates from FY 2015-16 through FY 2019-20.

9.3.2 IMPLEMENTATION TO ACHIEVE WATER USE TARGETS

CWC 10631.

(e)(1)(A) For an urban retail water supplier, as defined in Section 10608.12, a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years. The narrative shall describe the water demand management measures that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.

The Demand Management Measures implemented by the City are discussed in Section 9.2. Descriptions regarding the nature and extent of these Demand Management Measures implemented by the City over the past five years are discussed in Section 9.3. The City will continue to implement these Demand Management Measures and other water conservation programs and work collaboratively with IEUA and MWD to provide water conservation programs for its residents.

As discussed in Section 5.5, the City's per-capita water use during FY 2019-20 was 161 GPCD. The City's confirmed 2020 Water Use Target is 196 GPCD. The City's per-capita water use during FY 2019-20 meets the 2020 Water Use Target and is in compliance. The City met the 2020 Water

Use Target through the implementation of the Demand Management Measures discussed in Section 9.2. Continued implementation of these Demand Management Measures will assist the City in meeting water use targets and objectives.

9.4 WATER USE OBJECTIVES (FUTURE REQUIREMENTS)

The City is currently working with DWR to develop Water Use Objectives pursuant to AB 1668 and SB 606. Beginning in 2024, water agencies, including the City, are required to begin reporting compliance of their Water Use Objectives consisting of indoor residential water use, outdoor residential water use, commercial, industrial and institutional, irrigation with dedicated meters, water loss, and other unique local uses. The City plans to meet its Water Use Objectives through continued implementation of the Demand Management Measures discussed in Section 9.2.

Chapter 10

PLAN ADOPTION, SUBMITTAL, AND IMPLEMENTATION

LAY DESCRIPTION – CHAPTER 10

PLAN ADOPTION, SUBMITTAL, AND IMPLEMENTATION

Chapter 10 (Plan Adoption, Submittal, and Implementation) of the City's 2020 Plan discusses and provides the following:

- The steps the City has performed to adopt and submit its 2020 Plan are detailed.
- The steps the City has performed to adopt and submit its Water Shortage Contingency Plan are detailed.
- The City coordinated the preparation of its 2020 Plan with the Chino Basin Watermaster, CDA, County of San Bernardino, Cucamonga Valley Water District, Fontana Water Company, IEUA, Jurupa Community Services District, Monte Vista Water District, MWD, Santa Ana Watershed Project Authority, SAWCo, WFA, and the Cities of Chino, Chino Hills, Fontana, Montclair, Pomona, Rancho Cucamonga, and Upland. The City notified these agencies at least sixty (60) days prior to the public hearing of the preparation of the 2020 Plan and invited these agencies to participate in the development of the 2020 Plan.
- The City provided a notice of the public hearing to the same agencies regarding the time, date, and place of the public hearing.
- The City published a newspaper notification of the public hearing, once a week for two successive weeks.
- The City conducted a public hearing to discuss and adopt the City's 2020 Plan and City's Water Shortage Contingency Plan.
- Within 30 days of adoption, the City submitted the 2020 Plan and Water Shortage Contingency Plan to the California Department of Water Resources.
- Within 30 days of adoption, the City submitted all data tables associated with the 2020 Plan to the California Department of Water Resources.
- Within 30 days of adoption, the City submitted a copy of the 2020 Plan to the State of California Library.
- Within 30 days of adoption, the City submitted a copy of the 2020 Plan (and Water Shortage Contingency Plan) to the County of San Bernardino Assessor- Recorder/ Clerk's office and the City Clerk's Office.
- Within 30 days after submittal of the 2020 Plan to the California Department of Water Resources, the City made the 2020 Plan (including the Water Shortage Contingency Plan) available at the City Clerk's Office and on the City's website.

- The steps the City will perform to amend the 2020 Plan and/or the Water Shortage Contingency Plan, if necessary, are provided.

10.1 INCLUSION OF ALL 2020 DATA

The data provided in the City's 2020 Plan and the Water Shortage Contingency Plan is provided on a FY basis through June 30, 2020 (as discussed in Section 2.5).

10.2 NOTICE OF PUBLIC HEARING

The City's public hearing notification process for its 2020 Plan and the Water Shortage Contingency Plan is discussed below.

10.2.1 NOTICE TO CITIES AND COUNTIES

CWC 10621.

(b) Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days before the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan.

CWC 10642.

…The urban water supplier shall provide notice of the time and place of a hearing to any city or county within which the supplier provides water supplies. Notices by a local public agency pursuant to this section shall be provided pursuant to Chapter 17.5 (commencing with Section 7290) of Division 7 of Title 1 of the Government Code. A privately owned water supplier shall provide an equivalent notice within its service area…

10.2.1.1 60 DAY NOTIFICATION

As discussed in Section 2.6.1 and Section 2.6.2, the City coordinated the preparation of the 2020 Plan with the Chino Basin Watermaster, CDA, Cucamonga Valley Water District, Fontana Water Company, IEUA, Monte Vista Water District, MWD, Santa Ana Watershed Project Authority, SAWCo, and WFA. The City notified these agencies, as well as the city and county within which the City provides water supplies, at least sixty (60) days prior to the public hearing of the preparation of the 2020 Plan and invited them to participate in the development of the Plan. A copy of the notification letters sent to these agencies is provided in Appendix D.

10.2.1.2 NOTICE OF PUBLIC HEARING

The City provided a notice of the public hearing to the Chino Basin Watermaster, CDA, Cucamonga Valley Water District, Fontana Water Company, IEUA, Monte Vista Water District, MWD, Santa Ana Watershed Project Authority, SAWCo, and WFA. The notice includes the time and place of the public hearing. In accordance with Government Code Section 7291, if the City's audience for the public hearing includes a substantial number that are not able to speak or understand English, the City will provide interpreters. To ensure that the draft 2020 Plan and the draft Water Shortage Contingency Plan were available for review, the City placed a copy at the City Clerk's Office located at City Hall and made a copy available for review on its website. Copies of the notice of the public hearing are provided in Appendix D.

10.2.1.3 SUBMITTAL TABLES

Table 10-1 summarizes the agencies which were provided notifications by the City.

Table 10-1 Notification to Cities and Counties

Submittal Table 10-1 Retail: Notification to Cities and Counties		
City Name	60 Day Notice	Notice of Public Hearing
Add additional rows as needed		
Chino	Yes	Yes
Chino Hills	Yes	Yes
Fontana	Yes	Yes
Montclair	Yes	Yes
Pomona	Yes	Yes
Rancho Cucamonga	Yes	Yes
Upland	Yes	Yes
County Name *Drop Down List*	60 Day Notice	Notice of Public Hearing
Add additional rows as needed		
San Bernardino County	Yes	Yes
NOTES:		

10.2.2 NOTICE TO THE PUBLIC

CWC 10642.

…Prior to adopting either, the urban water supplier shall make both the plan and the water shortage contingency plan available for public inspection and shall hold a public hearing or hearings thereon. Prior to any of these hearings, notice of the time and place of the hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code. The urban water supplier shall provide notice of the time and place of a hearing to any city or county within which the supplier provides water supplies.

Government Code 6066.

Publication of notice pursuant to this section shall be once a week for two successive weeks. Two publications in a newspaper published once a week or oftener, with at least five days intervening between the respective publication dates not counting such publication dates, are sufficient. The period of notice commences upon the first day of publication and terminates at the end of the fourteenth day, including therein the first day.

Pursuant to Section 6066 of the Government Code, the City published an English and Spanish notice of public hearing in the newspaper during the weeks of June 1, 2021 and June 8, 2021. A notice of public hearing was also provided to the City Clerk's office and was posted throughout the City of Ontario and on the City's website. A copy of the published notice is provided in Appendix D. To ensure the draft 2020 Plan and the draft Water Shortage Contingency Plan were available for review, the City placed a copy of the Plan at the City Clerk's Office located at City Hall and made a copy available for review on its website.

10.3 PUBLIC HEARING AND ADOPTION

CWC 10642.

…Prior to adopting either, the urban water supplier shall make both the plan and the water shortage contingency plan available for public inspection and shall hold a public hearing or hearings thereon.

CWC 10608.26.

(a) In complying with this part, an urban retail water supplier shall conduct at least one public hearing to accomplish all of the following:

(1) Allow community input regarding the urban retail water supplier's implementation plan for complying with this part.

(2) Consider the economic impacts of the urban retail water supplier's implementation plan for complying with this part.

(3) Adopt a method, pursuant to subdivision (b) of Section 10608.20, for determining its urban water use target.

10.3.1 PUBLIC HEARING

Prior to adopting the draft 2020 Plan and the draft Water Shortage Contingency Plan, the City held a public hearing on June 15, 2021 which included input from the community regarding the City's draft 2020 Plan and the draft Water Shortage Contingency Plan. As part of the public hearing, the City adopted a method to determine of its water use targets through selection of Target Method 1 (see Section 5.2.1 and Appendix H). In addition, the City considered the economic impacts of meeting these water use targets; including measures described in Section 8.8.

10.3.2 ADOPTION

CWC 10642.

… After the hearing or hearings, the plan or water shortage contingency plan shall be adopted as prepared or as modified after the hearing or hearings.

Following the public hearing, the City adopted both the draft 2020 Plan and the draft Water Shortage Contingency Plan (included in Chapter 8). A copy of the resolutions adopting the 2020 Plan, the Water Shortage Contingency Plan, and the addendum to the 2015 Urban Water Management Plan are provided in Appendix R.

10.4 PLAN SUBMITTAL

CWC 10621.

(e) Each urban water supplier shall update and submit its 2020 plan to the department by July 1, 2021.

CWC 10644.

(a) (1) An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption.

CWC 10635.

(c) The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.

The City's submittal process for its 2020 Plan and the Water Shortage Contingency Plan is discussed below.

10.4.1 SUBMITTING A UWMP AND WATER SHORTAGE CONTINGENCY PLAN TO DWR

The City Council adopted the 2020 Plan on June 15, 2021 and within 30 days of adoption and before July 1, 2021, the City submitted the adopted 2020 Plan (including the Water Shortage Contingency Plan) to DWR. The 2020 Plan and Water Shortage Contingency Plan were submitted through DWR's "Water Use Efficiency (WUE) Data Portal" website.

DWR developed a checklist which was used by the City to assist DWR with its determination that the City's 2020 Plan has addressed the requirements of the California Water Code. The City has completed the DWR checklist by indicating where the required CWC elements can be found within the City's 2020 Plan (See Appendix C).

10.4.2 ELECTRONIC DATA SUBMITTAL

CWC 10644.

(a)(2) The plan, or amendments to the plan, submitted to the department ...shall be submitted electronically and shall include any standardized forms, tables, or displays specified by the department.

Within 30 days of adoption of the 2020 Plan and before July 1, 2021, the City submitted all data tables associated with the 2020 Plan through DWR's "Water Use Efficiency Data Portal" website.

10.4.3 SUBMITTING A UWMP, INCLUDING WSCP, TO THE CALIFORNIA STATE LIBRARY

Within 30 days of adoption of the 2020 Plan by the City Council, a copy (CD or hardcopy) of the 2020 Plan was submitted to the State of California Library. A copy of the letter to the State Library will be maintained in the City's file. The 2020 Plan will be mailed to the following address if sent by regular mail:

California State Library
Government Publications Section
Attention: Coordinator, Urban Water Management Plans
P.O. Box 942837
Sacramento, CA 94237-0001

The 2020 Plan will be mailed to the following address if sent by courier or overnight carrier:

California State Library
Government Publications Section
Attention: Coordinator, Urban Water Management Plans

Sacramento, CA 95814

10.4.4 SUBMITTING A UWMP TO CITIES AND COUNTIES

Within 30 days of adoption of the 2020 Plan (including the Water Shortage Contingency Plan) by the City Council, a copy of the 2020 Plan was submitted to the County of San Bernardino Assessor-Recorder/ Clerk's office and the City of Ontario's City Clerk's Office. A copy of the letter to the County of San Bernardino will be maintained in the City's file.

10.5 PUBLIC AVAILABILITY

CWC 10645.

(a) Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.

(b) Not later than 30 days after filing a copy of its water shortage contingency plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.

Within 30 days after submittal of the 2020 Plan to DWR, the City made the 2020 Plan (including the Water Shortage Contingency Plan) available at the City Clerk's Office located at City Hall during normal business hours and on the City's website.

10.6 NOTIFICATION TO PUBLIC UTILITIES COMMISSION

CWC 10621.

(c) An urban water supplier regulated by the Public Utilities Commission shall include its most recent plan and water shortage contingency plan as part of the supplier's general rate case filings.

The City is not regulated by the California Public Utilities Commission (CPUC).

10.7 AMENDING AN ADOPTED UWMP OR WATER SHORTAGE CONTINGENCY PLAN

CWC 10621.

(d)The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640).

CWC 10644.

(a)(1) An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption. Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.

The City's amendment process for its 2020 Plan is discussed below.

10.7.1 AMENDING A UWMP

If the City amends the adopted 2020 Plan, the amended Plan will undergo adoption by the City's governing board. Within 30 days of adoption, the amended Plan will then be submitted to DWR, the State of California Library, the County of San Bernardino Assessor- Recorder/ Clerk's office, and the City of Ontario's City Clerk's Office.

10.7.2 AMENDING A WATER SHORTAGE CONTINGENCY PLAN

CWC 10644.

(b) If an urban water supplier revises its water shortage contingency plan, the supplier shall submit to the department a copy of its water shortage contingency plan prepared pursuant to subdivision (a) of Section 10632 no later than 30 days after adoption, in accordance with protocols for submission and using electronic reporting tools developed by the department.

If the City amends the adopted 2020 Plan (including the Water Shortage Contingency Plan), the amended Plan (and Water Shortage Contingency Plan) will undergo adoption by the City's governing board. Within 30 days of adoption, the amended Plan (and Water Shortage Contingency Plan) will then be submitted to DWR through the WUE portal, the State of California Library, the County of San Bernardino Assessor- Recorder/ Clerk's office, and the City of Ontario's City Clerk's Office.

SECTION ES

EXECUTIVE SUMMARY

ES-1 General

The City's latest Water Master Plan was completed in 2012. The intent of the 2020 Water Master Plan Update was to update the City's water model, perform hydraulic analyses, and develop capital improvement project recommendations based on the latest available information. The water model geometry was imported from the City's Water Geodatabase, from March 2019. The existing model demands and diurnal patterns were updated with the recent production, purchase, and water billing data. Future planning data was utilized to estimate future water demands. The hydraulic model was calibrated and used to conduct the existing and future system analyses. Average day demand (ADD), maximum day demand (MDD), peak hour and MDD plus fire flow scenarios were run. Existing and future system deficiencies were identified and improvement project were recommended.

ES-2 Study Area

The water service area coincides with the City of Ontario boundary with the exception of two small areas. The City is divided into two distinct areas, the Original Model Colony (OMC) and Ontario Ranch (OR). The OMC consists of existing residential, commercial, and industrial developments, and the Ontario International Airport. It comprises approximately 37.2 square miles. Ontario Ranch is an agricultural area that was annexed to the City in 1999. It currently consists of approximately 12.8 square miles of primarily agricultural land.

The City's General Plan 2010 details future development of the agricultural lands in Ontario Ranch into a mix of residential, commercial, industrial, and public uses. Development of Ontario Ranch has begun with the development of Edenglen residential community located southeast of the intersection of Riverside Drive and Mill Creek Avenue. Residential communities currently in construction include Park Place development located east of Archibald Avenue and north and south of Merrill Avenue and the New Haven development located southwest of Haven Avenue and Schaefer Avenue.

For this Water Master Plan Update, the future residential population of Ontario Ranch was estimated to reach about 190,594. The total population of the City is estimated to expand to 371,979.

ES-3 Water Supply

The City's existing imported water supply consists of water from the Water Facilities Authority (WFA) and Chino Basin Desalter Authority (CDA), with total entitlements of 25.0 MGD (17,260 AFY) and 8.6 MGD (8,533 AFY), respectively.

The City extracts groundwater from the Chino Groundwater Basin (Chino Basin or Basin), via seventeen (17) existing wells. Per the Chino Basin Judgement, the City of Ontario has appropriative rights to 16,337 AFY (14.6 MGD). The City has secured additional supply through early transfers for unused groundwater, groundwater recharge, and acquisition of groundwater rights.

ES-4 Water Use

Historical water production and purchase data was reviewed between 2007 and 2019, which indicate that there has been a decrease in potable water production in recent years. This may be attributed to the expansion of the City's recycled water system, as well as a conscientious water conservation effort by the customers.

The existing potable water demand is important for evaluating the adequacy of the existing potable water facilities. Upon reviewing current production, purchase, and water billing data, the existing average day demand (ADD) is 19,280 gpm (31,153 AFY, 27.8 MGD) and the maximum day demand (MDD) is 29,790 gpm (48,951 AFY, 42.9 MGD).

To account for future development and redevelopment within the service area, future demands were estimated from specific plans, the General Plan, and the potable water demand factors. The potable water unit demand factors are generally based on the factors that were developed as a part of a study completed in May 2016 entitled "*Ultimate Citywide Water Demand Estimate*", and the revised potable water unit demand factors are shown in Table ES-1

ES-1

Potable Water Unit Demand Factors

Landuse		SAWCO (AFY)	Density (people/ du)[2]	Factors[3]

Public Elementary School (w/RW)	PS	-	-	10	gpd/student	1,800	-

[1] *Max Density per the City's 2010 General Plan (The Ontario Plan) for OMC without recycled water. Density for LDR, LMDR, MDR, and HDR with recycled water (Ontario Ranch) were increased per the City Planning Department recommendation (March 2016).*

[2] *Density per the City's 2010 General Plan (The Ontario Plan)*

[3] *Unit Flow Factor Abbreviations:*

ac = acre *du = dwelling unit* *gpd = gallons per day*

room = hotel/motel room *stu = student* *tsf = thousand square feet*

[4] *If possible it is recommended to use 130 - 155 gpd/room on a case by case basis. It is difficult to estimate the number of rooms or square footage per acre.*

[5] *Mixed Use demands should be based on the types of landuse that make up the specific area and the unit demand factors provided above. The City's 2010 General Plan (The Ontario Plan) provides detailed information on the landuses that make up each mixed use area.*

The future average day demand (ADD) was 35,716 gpm (57,610 AFY, 51.4 MGD) and the maximum day demand (MDD) was 54,778 gpm (88,357 AFY, 78.9 MGD).

ES-5 Diurnal Patterns

To evaluate the adequacy of the potable water sources of supply, pumping facilities, reservoirs, and the transmission / distribution facilities, it is important to have an understanding of how the potable water demand vary over a 24-hour period. A mass balance of the supply in, flow out, and change in reservoir level was conducted to develop the diurnal demand patterns in 15 minute increments. Diurnal demand patterns were developed by hydraulic zone, by meter type, and for high water users. Since system pressures, pipe velocities and fire flow capabilities can be affected by the usage patterns of customers with historically high water use, specific diurnal patterns were developed for the high water users.

ES-6 Existing System

According to the City's Water Geodatabase from March 2019, the City's existing domestic water system consisted of the following:

- Five (5) primary pressure zones (925, 1010, 1074, 1212, and 1348 Zones)
- Over 3.1 million feet (584 miles) of transmission and distribution pipe, 2 inches through 42 inches in diameter
- 7,277 fire hydrants
- 35,906 water meters
- Seventeen (17) active wells
- Twelve (12) reservoirs with a total volume of 75 MG
- Six (6) active booster pump stations
- Fifteen (15) pressure reducing stations (PRS)
- Two (2) connections to Water Facilities Authority
- Two (2) connections to Chino Desalter Authority
- Five (5) inter-agency connections
- Two (2) Ion Exchange Treatment Facility
- Four (4) altitude valves

The existing potable water system is shown on Figure ES-1.

ES-7 Performance Evaluation Criteria

Establishing performance criteria is an important part of evaluating existing water systems, as it forms the basis for system analysis and system improvement recommendations. Some criteria are based upon experience and their application is at the discretion of the water purveyor. This includes service pressures, storage capacity, and sources of supply. Other criteria, such as water quality and fire protection, are based on federal, state and local jurisdictional requirements. A summary of the service criteria is listed in Table ES-2.

ES-2

Service Criteria

Description	Criteria	Existing Requirement	Future Requirement
1. Source of Supply			
a. Total	Maximum Day Demand (except for closed zones which shall be Maximum Day Demand plus Fire Flow Demand or Peak Hour, whichever is greater)	29,790 gpm	54,780 gpm
b. Local Supply	Average Day Demand	19,280 gpm	35,700 gpm
2. Reservoir Capacity			
a. Operational Storage	30% of Maximum Day Demand for the OMC and 25% of Maximum Day Demand for Ontario Ranch	TBD	TBD
b. Emergency Storage	100% of Average Day Demand	27.8 mg	39.7 mg
c. Fire Suppression	Highest Fire Flow Requirement		
Residential			
Rural	1,500 gpm for 2 hours	0.18 mg	0.18 mg
Low Density	1,500 gpm for 2 hours	0.18 mg	0.18 mg
Low-Medium Density	1,500 gpm for 2 hours	0.18 mg	0.18 mg
Medium Density	2,000 gpm for 2 hours	0.24 mg	0.24 mg
High Density	3,500 gpm for 4 hours	0.84 mg	0.84 mg
Retail / Service			
Neighborhood Commercial	2,500 gpm for 3 hours	0.45 mg	0.45 mg
General Commercial	3,000 gpm for 3 hours	0.54 mg	0.54 mg
Office Commercial	3,000 gpm for 3 hours	0.54 mg	0.54 mg
Hospitality	4,000 gpm for 4 hours	0.96 mg	0.96 mg
Employment			
Business Park	3,000 gpm for 3 hours	0.54 mg	0.54 mg
Industrial	4,000 gpm for 4 hours	0.96 mg	0.96 mg

ES-8 Hydraulic Model

The hydraulic model was developed to evaluate the adequacy of the existing facilities under the current and future supply and demand conditions.

Generally, the model development steps included the following:

1. Import water system GIS data to modeling software
2. Verify and complete pipe information (pressure zone, diameter, length, roughness)
3. Verify and complete junction information (pressure zone, elevations)
4. Add detailed facility data (wells, pump station, reservoir, imported water turnouts, and pressure reducing stations)

5. Add facility information (dimensions and water level for tank, pump curves for pumps, sizes and pressure settings for pressure reducing valves, and aquifer levels for well pump suction levels)
6. Determine and assign demands to model junctions
7. Develop and assign diurnal demand curves to model junctions
8. Assign controls to facilities (well, booster pump station, and altitude valve start and stop conditions)
9. Model Calibration

ES-9 Model Calibration

The general calibration methodology was to gather as much system information as possible from available SCADA information and pressure measuring equipment temporarily installed in the field. This information was then used for input into the model as well as for comparison of model results. The calibration process was used to verify the accuracy of the model, system configuration, and the hydraulic parameters utilized.

April 18, 2019 was selected as the calibration day. SCADA data, specific to the calibration data, was reviewed to research the initial reservoir levels, well and pump station start and stop times, imported water turnout flowrates, and PRS status. A mass balance analysis was performed for each hydraulic zone to develop the calibration day demand and diurnal patterns. A calibration scenario was created in the hydraulic model, which includes this input data that is specific to April 18, 2019.

The model reservoir levels were compared to the SCADA data over the 24-hour period to verify that model calibration. To further calibrate the model, pressure data was collected by installing portable pressure data loggers throughout the system, during the calibration period. The model pressures were compared to the recorded field pressure at these locations to further verify that the model was well calibrated.

ES-10 Existing System Analysis

The existing system analysis was conducted to identify all necessary potable water system improvements. Planned rehabilitation and replacement projects were identified for facilities with known condition, capacity, operation, and/or maintenance deficiencies. These projects were identified upon review of the city's existing CIP schedule and meetings with City staff. Recommendations include but are not limited to replacement of transmission mains, reservoir rehabilitation, well rehabilitation, reservoir rehabilitation, pump station rehabilitation and groundwater treatment projects. Other projects recommended included PRS improvements, back-up power sources, meter improvements, SCADA upgrades and security improvements.

In addition, the established system criteria and calibrated system computer model were used to analyze the existing system under average day, maximum day, and peak hour conditions. Source of supply, reservoir storage, system pressure, and pipeline velocities were evaluated with the hydraulic model.

The condition of the existing potable water facilities were also evaluated. All facilities have useful lives for which relatively trouble-free service can be expected. Once exceeded, these facilities become less reliable, expensive to maintain and are subject to failure. Therefore, facility age is considered in the assessment of all water systems and in formulating future replacement projects. Wells, pump stations, reservoirs, and pipelines that have reached the end of their useful lives were identified and replacement projects were recommended.

Pipes with small diameters that do not currently meet the City's minimum criteria (8-inches) were recommended for replacement. In addition, fire hydrant laterals that do not meet the City's diameter minimum criteria (6-inches) and older metal hydrant laterals were also recommended for replacement.

The recommendations from the existing system analysis were incorporated into the capital improvement program (CIP).

ES-11 Future System

A future system model scenarios were updated to include the recommendations included from the existing system analysis as well as projects that have been identified for the future water system expansion.

Developer Impact Fee (DIF) projects were provided by the City and incorporated into the future system model and CIP. The DIF projects primarily include reservoirs, wells, pump stations, pipelines, water quality treatment facilities, and pressure reducing stations that will serve the Ontario Ranch (OR) developments in the 925 Zone and the 1010 Zone. The future potable water system is shown on Figure ES-2.

The proposed DIF projects include one additional 6 MG reservoir and two 9 MG reservoirs in the 925 Zone. The proposed 6 MG reservoir will be located adjacent the existing 6 MG reservoir (Dupont Ave and Jurupa St). The two 9 MG reservoirs are planned to be located between Bon View Avenue and Cucamoga Avenue, north of Francis Street. Treatment facilities will be provided at both reservoir sites to treat groundwater before entering the distribution system. The DIF projects also include seven (7) new wells, which will provide an additional 17,000 gpm capacity for the future growth in this area.

The proposed DIF projects were incorporated into the CIP.

ES-12 Future System Analysis

The established system criteria and future system model scenarios were used to analyze the future system under average day, maximum day, peak hour, and maximum day plus fire flow conditions. Source of supply, reservoir storage, system pressure, pipeline velocities, fire flow pressure, and fire flow availability were evaluated with the hydraulic model.

The recommendations from the future system analysis were incorporated into the CIP.

ES-13 Capital Improvement Program

The primary goal of the Capacity Improvement Program (CIP) is to provide the City with a long-range planning tool for implementing its water system improvements in an orderly manner and a basis for financing of these improvements. The CIP consists of projects that will enhance the system to meet the established criteria, properly maintain the system's assets, and replace the facilities that have reached the end of their useful lives.

ES-13.1 Project Categorization

Improvement projects are categorized as follows:

Existing System Improvement Projects include:

- Improvements identified from the hydraulic model analysis, such as velocity and fire flow deficiencies.
- Projects identified from the City's operations and engineering staff, to improve the condition of the main facilities such as reservoirs.
- Projects included on the City's existing DIF maps in the OMC area

Annual Improvement Projects are projects that need to be regularly updated and include:

- Reservoir recoating/repainting/ and repair improvements
- Meter replacement

Condition Projects – Mainline Replacement Program include:

- Small diameter pipes
- Pipes exceeding useful lives

Condition Projects – Facility Improvement Program include:

- Improvements to existing fire hydrant lateral size and/or material
- Wells exceeding useful lives
- Pump stations exceeding useful lives
- Reservoirs exceeding useful lives

Future System Development Projects include:

- DIF projects in the OR area

ES-13.2 Project Cost Estimate

The cost estimates are based upon recent information for similar projects in the City of Ontario, and include contingencies for this planning level study. The cost estimates are based on the unit construction costs, detailed in Table ES-3. Pipeline costs take into consideration the size of the pipe as well as whether the construction will be within the OMC or OR areas. OMC is largely developed and there are many existing utilities to consider; therefore, the costs of replacing water pipes will be generally higher than the new construction costs in undeveloped areas such as OR.

Pipe improvements recommendations in the OMC are based on the replacement of the existing pipes. Replacement costs are generally more conservative and will therefore allow the City more flexibility for each project. Preliminary design studies should be conducted, utilizing detailed utility information to identify and evaluate project alternatives such as parallel pipes.

The estimated unit costs for wells include permanent back-up power.

Table ES-3
Unit Cost Summary

Type		Units	OMC	OR
Pipe	6-inch [1]	$/LF	$108.36	$72.00
Pipe	8-inch	$/LF	$144.48	$96.00
Pipe	12-inch	$/LF	$216.72	$144.00
Pipe	16-inch	$/LF	$288.96	$192.00
Pipe	18-inch	$/LF	$325.08	$260.06
Pipe	24-inch	$/LF	$433.44	$331.56
Pipe	30-inch	$/LF	$541.80	$403.05
Pipe	36-inch	$/LF	$650.16	$486.31
Pipe	42-inch	$/LF	$758.52	$557.81
Well		$/LS	$4,000,000.00	
Reservoir		$/MG	$1,444,800.00	
Pump Station		$/HP	$6,000.00	
PRS		$/LS	$680,260.00	
Treatment Plant		$/Well	$6,324,111.00	

[1] *6-inch recommendation for laterals only*

The total costs include construction, contingency, engineering, design, and construction management costs. The individual cost components are calculated as follows:

1. Base Cost = Unit Cost x Recommended Units (such as footage, number of wells, etc.)
2. Contingency Cost = 10% of the Base Cost
3. Construction Cost = Base Cost + Contingency Cost
4. Engineering and Design Cost = 10% of the Construction Cost
5. Construction Management Cost = 5% of the Construction Cost
6. Total Cost = Construction Cost + Engineering and Design Cost + Construction Management Cost

Construction costs can be expected to fluctuate as changes occur in the economy. These costs should therefore be reevaluated and updated annually based upon Engineering News Record (ENR) Index for the Los Angeles area (ENRLA), with the base ENRLA Index of 12,144.49 for January 2020.

The recommended CIP is detailed in Table ES-4. Project locations are shown on Plate 1.

A summary of the total costs are as follows:

Existing System Improvement Projects:	$237,900,000
Condition Projects – Mainline Replacement Program:	$226,200,000
Condition Projects – Facility Improvement Program:	$89,600,000
Future System Development Projects:	$225,600,000
Total CIP cost:	**$779,300,000**
Annual Improvement Projects:	$3,600,000/Year

SECTION 1

INTRODUCTION

1-1 Purpose

The City of Ontario provides potable water service to residential, commercial, industrial, public and agricultural lands and the Ontario International Airport within its service area. The City recognizes its responsibility to efficiently meet the customers' needs with long range planning efforts. By reviewing its existing water system and future needs, the City can continue to maintain a high service level and reliability in its water system in a cost effective and fiscally responsible manner. This report is intended to update the domestic water analysis of the *2012 Water Master Plan* and to provide a comprehensive planning guide for improving and upgrading the City's domestic water system.

1-2 Previous Studies

Previous studies completed and utilized in the development of this Water Master Plan include the following:

- *The Ontario Plan (General Plan), February 2010*
- *The Ontario Plan Draft Environmental Impact Report, April 2009*
- *City of Ontario Water and Recycled Water Master Plan Update*, *April 2006*
- *City of Ontario Water Master Plan, April 2012*
- *2015 City of Ontario Urban Water Management Plan, July 2016*
- *Ultimate Citywide Water Demand Estimate Technical Memorandum, May 2016*
- *Sanitary Sewer Survey, October 2016*

1-3 Scope of Work

The scope of work for this study consists of the following:

Task 1 – Obtain and Review all Related Information

Task 2 – Review and Update the City's Current Design Criteria

Task 3 - Update Potable Water Hydraulic Model

- Update the City's current model geometry to the most-recent GIS shapefiles
- Update all facilities (wells, pump stations, reservoirs, pressure reducing stations, turnouts and interconnections)
- Update facility operational controls
- Utilize City's existing potable water demand factors that were developed as part of the 2016 Ultimate Citywide Water Demand Estimate Technical Memorandum.
- Develop peaking relationships for demands based on the City's historical production and purchase data.
- Allocation of potable water demands, based on the most recent water billing meter records
- Develop diurnal patterns based on SCADA data, automatic meter read (AMR), and automatic meter infrastructure (AMI) data
- Model calibration consists of making adjustments to the model such that the field data and model results are similar for the chosen 24-hour calibration period.

Task 4 – System Analysis

- Existing and future system analyses are conducted for average day demand, maximum day demand, and maximum day plus fire flow demands.

- Review and update the following:
    - System-wide Supply Analysis
    - Storage Capacity Evaluation
    - Pipeline Replacement Plan

Task 5 – Develop an updated Capital Improvement Program (CIP)

1-4 Organization of Report

The Potable Water Master Plan Update presents the methodology for developing the hydraulic model. A brief outline of the report is as follows:

Section ES: ***Executive Summary***

Section 1: Introduction

Section 2: Study Area

Section 3: Water Supply

Section 4: Water Use

Section 5: Diurnal Patterns

Section 6: Existing System

Section 7: Criteria

Section 8: Hydraulic Model

Section 9: Model Calibration

Section 10: Existing System Analysis

Section 11: Future System

Section 12: Future System Analysis

Section 13: Capital Improvement Program

1-5 Acknowledgements

AKM Consulting Engineers would like to express their sincere appreciation to the following individuals for their valuable assistance and support throughout the preparation of this study:

- Scott Burton, Assistant Utilities General Manager
- Dennis Mejia, Utilities Engineering Division Manager
- Christy Stevens, Senior Associate Civil Engineer
- Jeffrey Krizek, Associate Engineer
- Tom O'Neill, Water Production Manager
- Chris Bonadurer, Water Production Supervisor
- Ivan Sanchez, Engineering Assistant/GIS
- Joline Neal, Water Quality Specialist

SECTION 2
STUDY AREA

2-1 Purpose

This section describes the City of Ontario water service area, the land uses within the study area, and population estimates.

2-2 Location

The study area, shown on Figure 2-1, coincides with the City of Ontario boundary with the exception of two small areas in the north central and northeastern portion of the City that are served by Cucamonga Valley Water District (CVWD). It is located approximately 35 miles east of downtown Los Angeles and encompasses approximately 50 square miles (32,060 acres) of residential, commercial, industrial, public and agricultural lands and the Ontario International Airport. It is bordered by the Cities of Chino and Montclair on the west; the Cities of Upland and Rancho Cucamonga on the north; the Cities of Fontana, Eastvale, and Jurupa Valley on the east; and the Cities of Chino and Eastvale on the south. The major highways crossing through portions of the study area include the San Bernardino Freeway (I-10) on the north, the Pomona Freeway (SR-60) on the south, and the Ontario Freeway (I-15) on the east.

The City is divided into two distinct areas, the Original Model Colony (OMC) and Ontario Ranch (OR). The two areas are generally divided by Riverside Drive. The OMC consists of existing residential, commercial, and industrial developments, and the Ontario International Airport. It comprises approximately 37.2 square miles (23,776 acres). Ontario Ranch is an agricultural area that was annexed to the City in 1999. It currently consists of approximately 12.8 square miles (8,182 acres) of agricultural land. The City's 2010 General Plan details plans to develop the agricultural lands in Ontario Ranch into a mix of residential, commercial, industrial, and public uses. The future residential population of Ontario Ranch is expected to reach about 181,385. Development of Ontario Ranch has begun with the development of Edenglen residential community located southwest and south east of the intersection of Riverside Drive and Mill Creek Avenue. Residential communities currently in construction include the Park Place development located southeast of Archibald Avenue and Merrill Avenue and the New Haven development located southwest of Haven Avenue and Schaefer Avenue.

2-3 Topographic Description and Geology

2-3.1 General Area

The City's water service area is located in the San Bernardino Plain, which is an expanse of sand, gravel and boulders. Dominating the valley are Mt. San Antonio, Cucamonga Peak, and Ontario Peak. Cucamonga Peak is visibly flat on top which represents sections of the original valley floor. Loose dirt and gravel flows swiftly from the slopes of these young mountains with the sometimes torrential rains.

The valley and plain has taken more than 10 million years to form. Geologists place the beginning of the area's geologic history between 12 and 28 million years ago, the same time the San Andreas Fault is believed to have been formed. The San Gabriel Mountains are part of the east-west trending transverse ranges, which run across the north-south grain of California. The San Gabriel Mountains are intersected 25 miles east of Ontario at the Cajon Pass by the San Andreas Fault. These mountains were partially formed by geologic activity along this fault.

Visible to the south of Ontario is a portion of the peninsular range consisting of the Santa Ana Mountains, the base of which is carved by the Santa Ana River. Several blocks of the peninsular range are separated by faults generally attributed to the San Andreas Fault system. Small rolling hills make up the north and west portions of the valley (Chino Hills, Diamond Bar, and the Covina Hills).

The transverse and peninsular ranges meet in the San Gorgonio Pass area, 50 miles east of Ontario. Mount San Gorgonio is the tallest peak in Southern California and is frequently visible from Ontario.

Soils Map
Figure 2-2

2-3.2 Elevations

The topography of the region generally slopes in a southwesterly direction. The highest point in the service area is west of Grove Avenue and north of 8th Street at 1180 feet above mean sea level (amsl), and the lowest point is at the intersection of Euclid Avenue and Merrill Avenue (633 feet amsl).

2-3.3 Soils

Native soils, shown on Figure 2-2, consist of the following:

Class I Soils	• Chino Silt Loam • Grangeville Fine Sandy Loam • Hanford Sandy Loam
Class II Soils	• Delhi Fine Sand • Hanford Coarse Sandy Loam • Hilmar Loamy Fine Sand
Class III Soils	• Tujunga Loamy Sand
Class IV Soils	• Soboda Stony Loamy Sand • Tujunga Gravelly Loamy Sand

Due to the presence of predominantly dairy industries over a long period of time, prime agricultural soils, high in salts and nitrates, cover approximately 2,999 acres or 36 percent of the total area in the Ontario Ranch (SOI General Plan Amendment, 1998). Organic materials (manure and feed) are reportedly present in thickness of up to six feet.

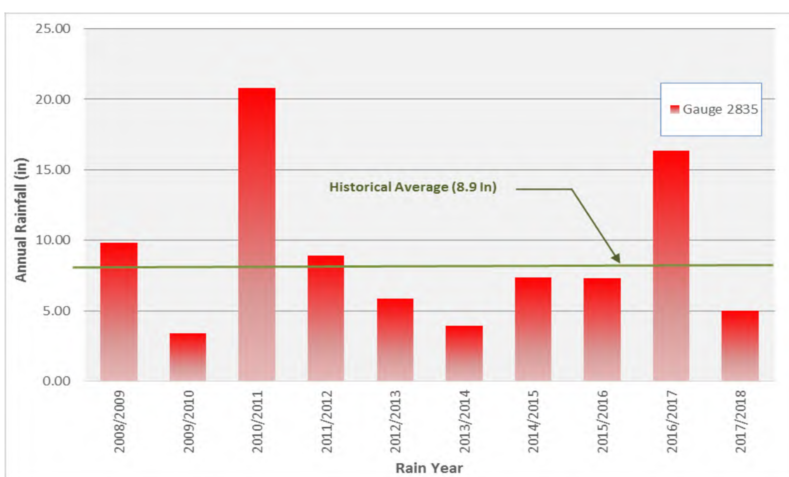
Ontario Ranch is located within the Chino Groundwater Basin, which has been found to maintain a relatively shallow water table. The SOI General Plan Amendment reported findings of groundwater elevations ranging from 530 to 590 feet in 1991. Water depths observed in 1991 were about 100 feet (SOI General Plan Amendment).

2-4 Climate

According to the National Oceanic and Atmospheric Administration (NOAA), the climate in the study area is generally Mediterranean with hot summers and warm winters. The average median temperature is approximately 66° F.

The historical average annual rainfall is about 8.9 inches. Most of the rainfall typically occurs between October and April. Figure 2-3 shows the seasonal rainfall from 2008 to 2018 as measured by the San Bernardino County Rain Gauge Stations 2835, which is located at Ontario Fire Station #4 on Mountain Avenue, south of Fourth Street.

Figure 2-3
Seasonal Rainfall 2008-2018



2-5 Land Use

The land use information utilized in the preparation of the Water Master Plan is primarily based upon the City's GIS parcel land use data and newly approved General Plan data. This information was supplemented by aerial photographs, field reviews, and information provided by City staff.

2-5.1 Existing Land Use

The City is a well planned urban community with a balance of residential, commercial, and industrial land uses. The City's land use GIS shapefile from May 2017 was considered current and has been used for reporting purposes. Within the service area, the residential land uses are 5,973 acres or 19 percent of the total. Industrial uses are 5,235 acres or 17 percent of the total. Approximately 6,741 acres or 22 percent of the total service area is Agricultural Multi-Use which primarily resides in the Ontario Ranch area. Table 2-1 provides a summary of the existing land uses. Figure 2-4 shows the locations of the land uses.

The total number of housing units in the City is estimated at 51,283. With a population of 182,871 and a 3.7 percent vacancy rate, the average number of persons per household is estimated at 3.69 (Ref: *California Department of Finance, Demographic Research Unit, Table E-5, 2020*).

POTABLE WATER MASTER PLAN UPDATE
Existing Land Use Map
Figure 2-4

2-5.2 Future Land Uses

The future land uses are generally based upon the City's latest general plan document entitled *The Ontario Plan (2010).* Revisions have been incorporated by the City's planning department, for specific developments that have been developed or planned that may differ from the 2010 document. Table 2-2 provides a summary of the future land uses. Figure 2-5 shows the locations of future land use according to the City's GIS land use shapefile from May 2017. The residential area will increase to 10,869 acres (34.2 percent of total). The employment area, including business parks and industrial uses, is expected to entail about 7,818 acres (24.6 percent of total).

- ***Residential Land Uses:*** The Ontario Plan defines five residential land use categories: Rural, Low Density, Low-Medium Density, Medium Density, and High Density. The plan provides densities for each of the residential land use categories, which are summarized in Table 2-2.
- ***Retail / Service:*** Four retail / service uses are defined: Neighborhood Commercial, General Commercial, Office Commercial, and Hospitality. The intensities for each commercial use are shown in Table 2-3.
- ***Employment:*** Two employment uses are defined: Business Park and Industrial. The intensities for each employment use are shown in Table 2-3.
- ***Open Space:*** Open Space land use designations include Non-Recreational Open Space, Recreational Open Space and Water Open Space (i.e. lakes, ponds, etc.).
- ***Public:*** Public land use designations include Public Facility and Public School.
- ***Other:*** Other land use designations include the Ontario International Airport, Landfill, Railroad and Roadways.

It should be noted that Table 2-2 is general in nature for the entire City. It has been found that many of the newer developments constructed and proposed in Ontario Ranch exceed the densities (dwelling unit per acre) anticipated when the 2012 Water Master Plan was completed. Therefore, the maximum densities for the Ontario Ranch area were increased in Table 2-2 (per the City Planning Department).

For the 2020 Potable Water Master Plan Update, the future land uses and associated sewer loads were estimated using more detailed information, such as specific plans and detailed development information, when available. This is especially important in the east portion of Ontario Ranch which is already being developed and the City has development proposals under review. Details of how future water loads were calculated and allocated in the hydraulic model are described in Section 4-7.3.

2-6 Population

Since its incorporation in 1890, the City of Ontario has grown from a population of 683 to approximately 182,871 in 2020 (*Ref: California Department of Finance, Table E-5, 2020*). The historical population increase from 1890 to 2020, as well as future projections are depicted on Figure 2-6.

It should be noted that the estimates shown on Figure 2-6 for the year 2000 through 2035 includes Ontario Ranch, which was annexed by the City in 1999. The population shown also includes the 628 acres of land (5,770 persons) within the Ontario Ranch, but served water by the Cucamonga Valley Water District (CVWD).

Projections for 2020 and 2035 are based on South California Association of Government future projections.

The future population in Ontario Ranch is expected to be approximately 181,385. The future population in the OMC is estimated at 190,594. The total future population is estimated at 371,979 which will nearly double the existing population.

SECTION 3
WATER SUPPLY

3-1 Source of Supply

The City's existing potable water supply consists of imported water from the Water Facilities Authority (WFA) and Chino Basin Desalter Authority (CDA) and the groundwater from Chino Basin, extracted via the City's wells. The City has seventeen (17) active wells. Over the last twelve years, the City has imported an average of 12,253 AFY and pumped 23,100 AFY from the groundwater basin. Therefore, about 35 percent of the City's water supply is imported.

3-2 Imported Water Supply

Water is imported into Southern California through two major water supply systems:

1. The Colorado River Aqueduct, constructed and operated by Metropolitan Water District of Southern California (MWD), transports water from the Colorado River to MWD's service area.
2. The State Water Project, owned and operated by the State of California Department of Water Resources (DWR), transports water from the Sacramento-San Joaquin Delta through the California Aqueduct.

The City's imported water supply over the last ten years is shown in Table 3-1.

Table 3-1

Imported Water Supply

Year	CDA Supply		WFA Supply		SAWCO		Total Imported Water Supply	
	(AFY)	(mgd)	(AFY)	(mgd)	(AFY)	(mgd)	(AFY)	(mgd)

3-2.1 Water Facilities Authority

The Water Facilities Authority (WFA) was formed in 1980 as a Joint Powers Authority by the Cities of Chino, Chino Hills, Ontario and Upland, and the Monte Vista Water District. It was formed to construct and operate water treatment facilities that provide a supplemental supply of potable water to its member agencies. The WFA currently owns and operates the Agua de Lejos Water Treatment Plant located at the Benson Avenue and 18th Street, in the City of Upland. It is a conventional surface water treatment facility that treats and disinfects imported water supplies, primarily State Water Project water that is purchased from MWD through WFA. The current rated capacity of the plant is 81 mgd. The City of Ontario owns 25 mgd, or 31.4 percent of the treatment plant capacity.

The water from Agua de Lejos Water Treatment Plant is conveyed to two locations that connect with the City's existing water system. The first turnout (Turnout 1) is located adjacent the 1212-1A and 1212-1B Reservoirs at the northwest corner of Eighth Street and Fern Avenue. The City has access to 16 mgd from the WFA Turnout 1, available to the 1212 Zone.

The second WFA connection (Turnout 2) is through the 1348 Zone and is located adjacent to the 1212-3 at the southeast corner of Campus Avenue and A Street. The City has an internal subconnection (Turnout 2A) that takes the water from Turnout 2 and feeds the 1212 Zone. The City has access to 9 mgd from the WFA Turnout 2. The maximum volume of water that the City can receive from their WFA connections is therefore 25 mgd. According to the City's operations staff, the WFA turnouts can currently be taken at a maximum flowrate of 17,260 AFY (15.4 mgd)

Based on historical records for 2007 through 2018, the average annual WFA supply has been 6,905 AFY (6.2 mgd), as shown in Table 3-1. The maximum annual supply was 10,967 AFY (9.8 mgd) in 2013. The minimum annual supply was 2,398 AFY (2.1 mgd) in 2016.

3-2.2 Chino Basin Desalter Authority

The City of Ontario is a member of the Chino Basin Desalter Authority (CDA), a joint powers agency created on September 25, 2001. Other members of the CDA include Jurupa Community Services District (JCSD), Santa Ana River Water Company (SARWC), IEUA, Western Municipal Water District (WMWD) and the Cities of Chino, Chino Hills, and Norco. The CDA purifies brackish groundwater extracted from the lower Chino Basin with the Chino 1 and Chino 2 Desalter facilities and distributes drinking water to member agencies. The treatment of the brackish groundwater, high in salts and nitrates, provide the members of the CDA a reliable source of water, as well as protects the downstream Santa Ana River of contamination. Each of the member agencies has "take or pay" contracts to purchase water produced by the CDA.

CDA owns and operates the two groundwater treatment desalination systems, Chino Desalter 1 (CDA I) and Chino Desalter 2 (CDA II). Both facilities include groundwater extraction wells, pumps and pipelines that provide water to advanced treatment facilities that include processes for pretreatment, filtration, air stripping of volatile organic compounds, ion exchange for removal of nitrates, and reverse osmosis for removal of salts. The treated water is then blended and disinfected to produce high quality drinking water that is delivered to member agencies through pipelines, pumps, and reservoirs.

CDA I is located in the City of Chino south of Kimball Avenue, west of Euclid Avenue. CDA I produces 14.2 mgd or 15,900 AFY of high-quality drinking water. In 2018, the City received 655AFY of water from the CDA I facility. The point of connection from CDA's facilities to the City's potable water system (1010 Zone) is located near the intersection of Archibald Avenue and the Remington Avenue. Water is pumped to the City from the JCSD system at the Archibald Pump Station. The water is a blend of CDA I water and JCSD system water.

CDA II is located at 11202 Harrel Street in Mira Loma, California. CDA has recently completed the Chino Desalter Phase 3 Expansion, which was planned to increase the existing capacity of CDA II by an additional 9.4 mgd or 10,500 AFY. Prior to the Phase 3 expansion, the City had a contract entitlement of 5,000 AFY (4.5 mgd). With the recent expansion the City's contract entitlement was increased to 8,533 AFY (8.6 mgd). Since the agreement is set up as "take or pay", the City tries to utilize the full entitlement.

The City has four points of connection to the CDA II system at the following locations:

- CDA II Lateral A – Philadelphia Street and Milliken Avenue (925 Zone)
- CDA II Lateral B – Philadelphia Street and Milliken Avenue (1010 Zone)

- CDA II Lateral C – Riverside Drive and Hamner Avenue (925 Zone)
- CDA II Lateral D – Riverside Drive and Hamner Avenue (1010 Zone)

The water at Laterals A and B consist of a blend of CDA II water and JCSD system water. The water at Laterals C and D consist water from CDA II alone.

3-2.3 Inter-Agency Connections

The City of Ontario has inter-agency connections with the following agencies:

- Cucamonga Valley Water District (CVWD) can provide water to the 1212 Zone, at the intersection of Milliken Avenue and Fourth Street. Water cannot be delivered to CVWD at this connection.
- City of Chino, can receive water from the City of Ontario's 1212 Zone, at reservoir near Benson Avenue and State Street. Water cannot be provided to the City at this connection.

3-3 Groundwater Supply

The City extracts groundwater from the Chino Groundwater Basin (Chino Basin or Basin), which is one of the largest groundwater basins in the Southern California area with storage capacity estimated at five to seven million acre-feet. It collects roughly 140,000 acre-feet of water each year. Chino Basin encompasses about 235 square miles of the upper Santa Ana River watershed and lies within portions of San Bernardino, Riverside, and Los Angeles counties. The location of the groundwater basin is illustrated in Figure 3-1.

3-3.1 Chino Basin Judgement

The Chino Basin Judgement (Judgement) was entered by the California State Superior Court for San Bernardino County on January 27, 1978. The Judgement adjudicates water rights in the Chino Basin and establishes the Chino Basin Watermaster (Watermaster) to account for and implement the management of the basin. The Judgement declared that the initial operation safe yield of the Chino Basin is 145,000 AFY. There are three pools of water users: agricultural, non-agricultural (industrial users), and appropriative (water municipalities and other government entities). The safe yield is allocated at 82,800 AFY to the agricultural pool, 7,366 AFY to the non-agricultural pool, and 54,834 AFY to the appropriative pool. The Judgement was expanded in 2000 and 2007 with the addition of Peace Agreements I and II, respectively, which further clarified the Watermaster's operations.

Per the Judgement, the City of Ontario has appropriative rights to 16,337 AFY and its share of the initial operating safe yield is 11,373 AFY or 21 percent of the 54,834 AFY appropriative pool rights. The City has secured additional supply through the following:

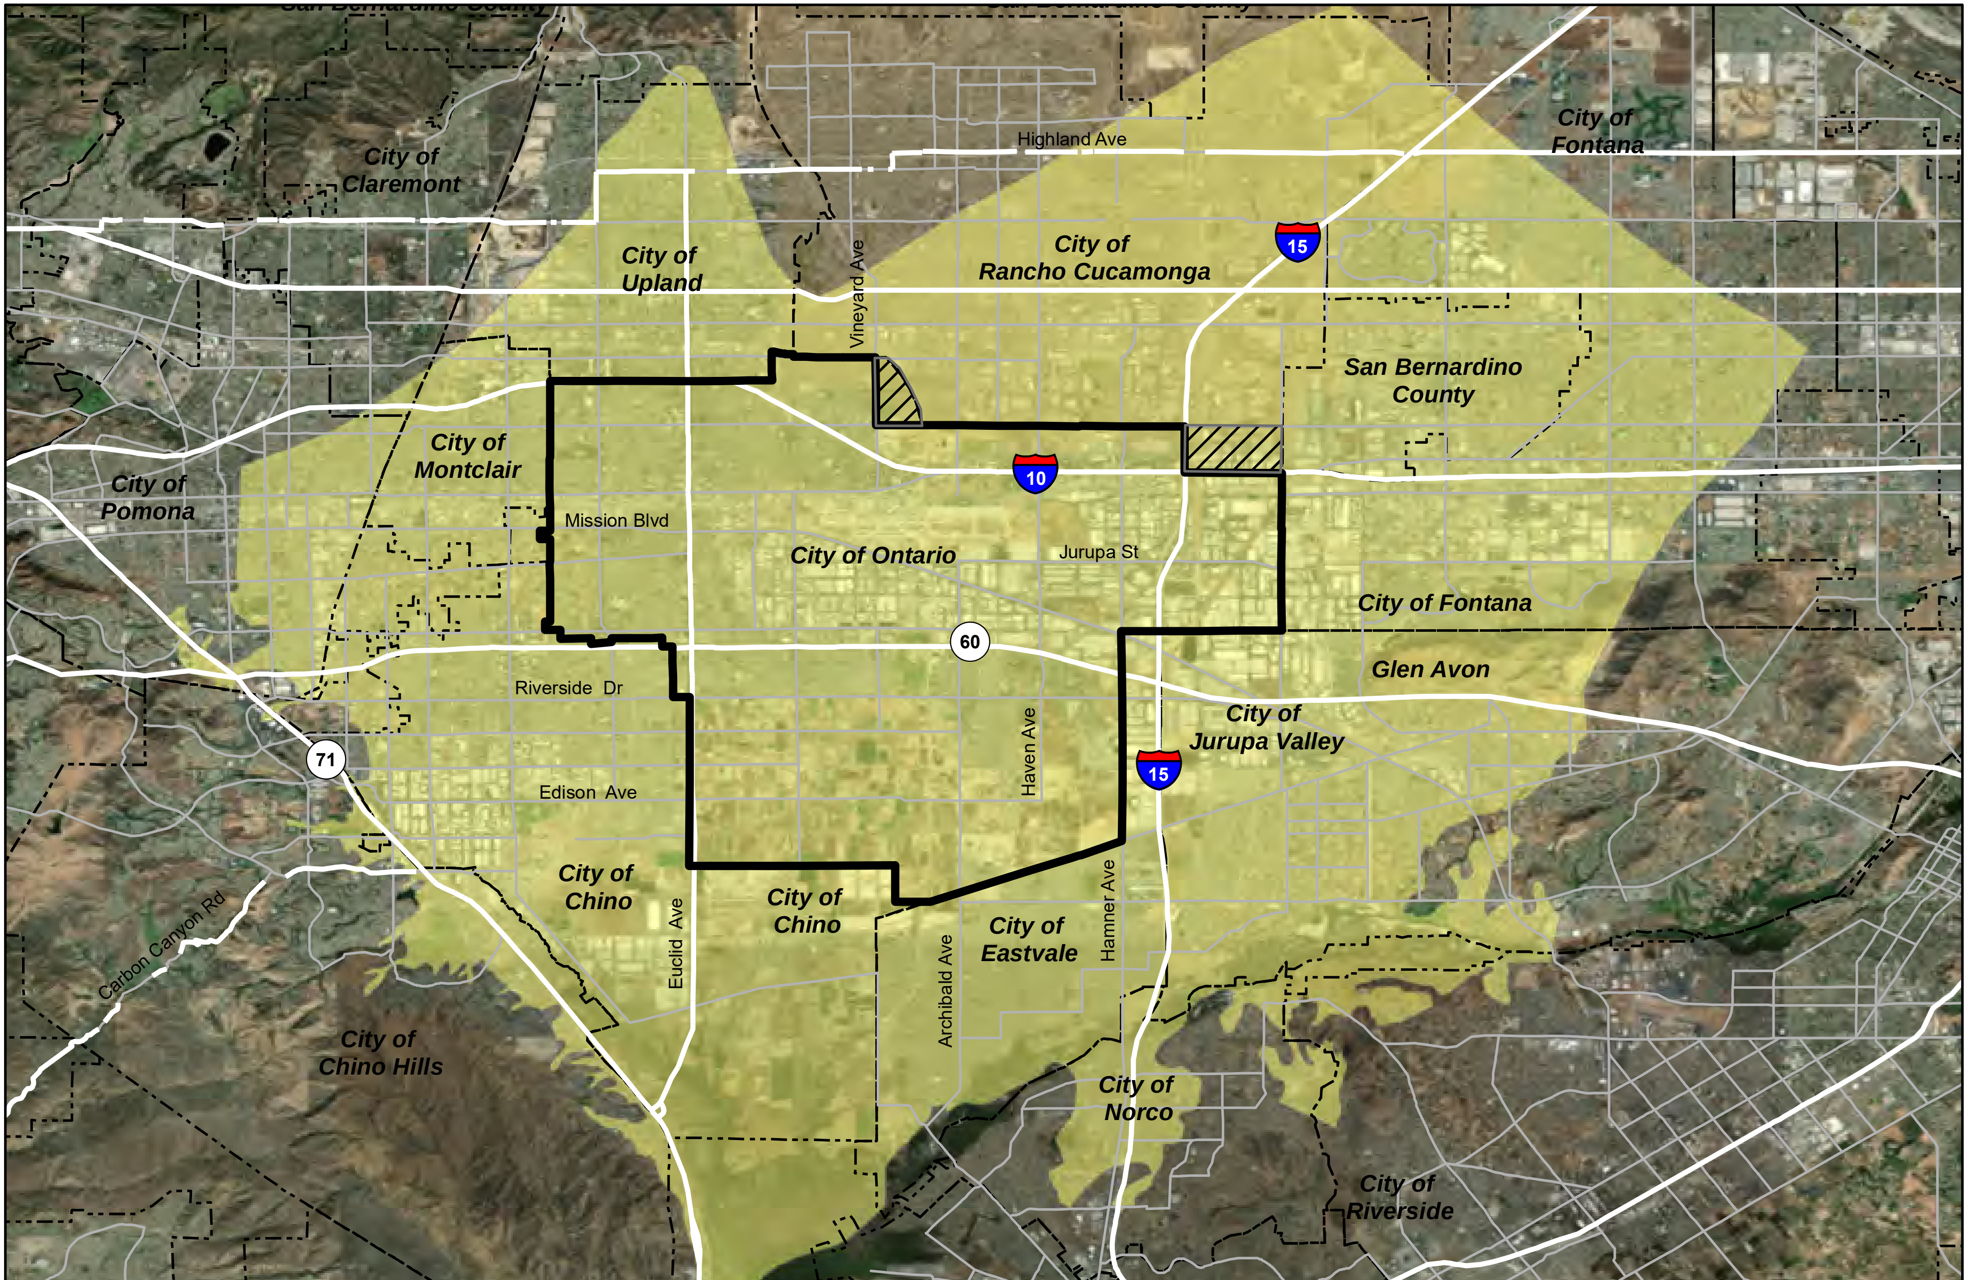
- Annual early transfers, which is expected water not used by agricultural pool
- Groundwater recharge from recycled water and storm water
- Purchased groundwater recharge rights from the City of Fontana
- Acquisition of San Antonio Water Company rights, available through the WFA connection

3-3.2 Watermaster

The Chino Basin Watermaster (Watermaster) is a governmental body responsible for managing water use and supplies within Chino Basin. The Watermaster's primary responsibilities include the following:

- Maintain and increase the water supply
- Sustain and improve water quality
- Ensure that water will be fairly shared
- Provide cooperative leadership
- Study and increase understanding of the basin

The Watermaster is comprised of three stakeholder groups based on how they use water obtained from the basin. The groups are called Pools and are represented by Pool Committees:



Legend

- Service Area Boundary
- Chino Groundwater Basin

ONTARIO

PROJECT NO: 1001398.00

DATE: June 2020

CITY OF ONTARIO
POTABLE WATER MASTER PLAN UPDATE

Chino Groundwater Basin

Figure 3-1

- Overlying Agricultural Pool Committee, representing dairymen, farmers, and the State of California;
- Overlying Non-Agricultural Pool Committee, representing area industries;
- Appropriative Pool Committee, representing local cities, public water districts, and private water companies.

Representatives from the three Pools form an Advisory Committee to oversee the regular activities of the Watermaster. The Pool Committees handle business affecting their own members and then make recommendations to the Advisory Committee. The Advisory Committee, in turn makes recommendations to the Watermaster Board of Directors, consisting of nine members appointed by the San Bernardino County Superior Court.

3-3.3 Optimum Basin Management Program

The Optimum Basin Management Program (OBMP) was adopted by the Watermaster after a 1998 court decree required the development of a detailed plan outlining issues facing Chino Basin and solutions to resolve them. The program was supposed to address water quality problems within the Chino groundwater basin and increase and improve the water supply available from this source. The OBMP identifies groundwater recovery in the southern portion of the basin as a way to improve basin water supplies.

The OBMP and the specific actions contained within it, has guided the Watermaster's activities ever since its adoption. The OBMP includes nine major tasks:

1. Comprehensive monitoring program for documenting changes in water level, quality, and flow by testing at wells within the Basin
2. Comprehensive recharge program
3. Water supply plan for the impaired areas of the Basin to improve water quality and supply
4. Regional supplemental water program
5. Comprehensive groundwater management plan for monitoring zone 1 to stop land subsidence
6. Cooperative programs with the Regional Board and other agencies to improve Basin management
7. Salt management program
8. Groundwater storage management program
9. Conjunctive use programs

3-3.4 Dry Year Yield Storage Program

The Dry Year Yield (DYY) Storage Program is a cooperative conjunctive use program involving MWD, IEUA, CBWM, Three Valleys Municipal Water District (TVMWD) and Chino Basin groundwater producers. Under the DYY Program, MWD is allowed to store up to 100,000 AFY of water in the Chino Basin when surplus water is available during wet years and to produce 33,000 AFY in dry, drought, or emergency periods.

The City of Ontario authorized execution of an agreement with IEUA to participate in the DYY program in 2003. Participation means that the City agrees to reduce its use of imported water compared to the previous year by a fixed amount, known as their "shift obligation". The City's shift obligation is 8,076 AFY. This means that during years when MWD calls for extraction, the City's WFA production would be reduced by 8,076 AFY compared to the previous year and it would extract this amount from the designated DYY wells.

DYY funds were used for the construction of three groundwater wells (Wells 45, 46, and 47) and an ion-exchange facility located at John Galvin Park to treat water extracted from Well 44 and Well 52. When MWD calls for stored water delivery, the City will operate these facilities, to meet its shift obligation. MWD would pay for the cost of operations and the City would pay MWD (through IEUA) the full service water rate. The City can use the DYY facilities to meet its normal water demands during other periods but is responsible for the O&M costs.

This program allows the City to be less reliant upon imported water supplies. The additional groundwater capacity allows the City to increase the percentage of groundwater supply used to meet peak demands.

3-4 Water Quality

Imported water quality and local groundwater quality per the City's 2018 Water Quality Report is shown in Table 3-2.

Imported water is generally of good quality with nitrate and total dissolved solid concentrations well below the established maximum contaminant levels.

The City's groundwater contains the following water quality issues for perchlorate, nitrates, 1,2,3 Trichloropropane (TCP), and bacterial constituents.

- Wells 3, 4, 9, 15, 31, 35, and 50 were removed from service due to high nitrate and/or perchlorate concentrations.
- Well 34 was removed from service due to (TCP) water quality issues.
- The operations of Wells 44 and 52 are limited due to the migration of the bacterial groundwater plume when these wells are used too frequently.
- Well 25 was taken out of service due to a PFOA detection, which was below the PFOA interim notification level.

Areas of high nitrate concentrations are shown on Figure 3-2.

The City is anticipating that all existing wells will require improvements to provide the necessary treatment capabilities for the various water quality issues with the groundwater source. Capital improvement projects are recommended for water quality treatment near Reservoir 925-2A, near future Reservoirs 925-1A and 925-1B, and for wells in the OMC.

CITY OF ONTARIO
POTABLE WATER MASTER PLAN UPDATE

PROJECT NO: 1001398.00

DATE: June 2020

High Nitrate and Plume Areas

Figure 3-2

SECTION 4
WATER USE

4-1 Historic Water Production and Purchase

The City obtains its potable water supply from groundwater wells in Chino Basin and imported water from the Water Facilities Authority (WFA) and the Chino Basin Desalter Authority (CDA). Currently, the City operates seventeen (17) active wells.

The total annual water production and purchase from January 2007 to December 2018 is shown in Table 4-1 and on Figure 4-1. Figure 4-2 illustrates the historic water production and purchase by month. Over the last twelve years, the annual supply has averaged a total of 35,774 AFY (31.9 mgd). The average groundwater production is 23,520 AFY (21.0 mgd). Per the Chino Basin Watermaster 41st Annual Report, the City of Ontario has appropriative rights to 16,337 AFY, and its share of the initial operating safe yield is 11,374 AFY or 21 percent of the appropriative pool rights. The City has secured additional supply through transfers, purchase, and groundwater recharge. The average amount of imported water purchased is 12,253 AFY (10.9 mgd).

There has been a decrease in production over the past twelve years. This may be attributed to the expansion of the City's recycled water system, as well as a conscientious water conservation effort by the customers. Water conservation is discussed further in Section 4-9.

Table 4-1

Figure 4-1

Historical Water Production and Purchase (Annual)

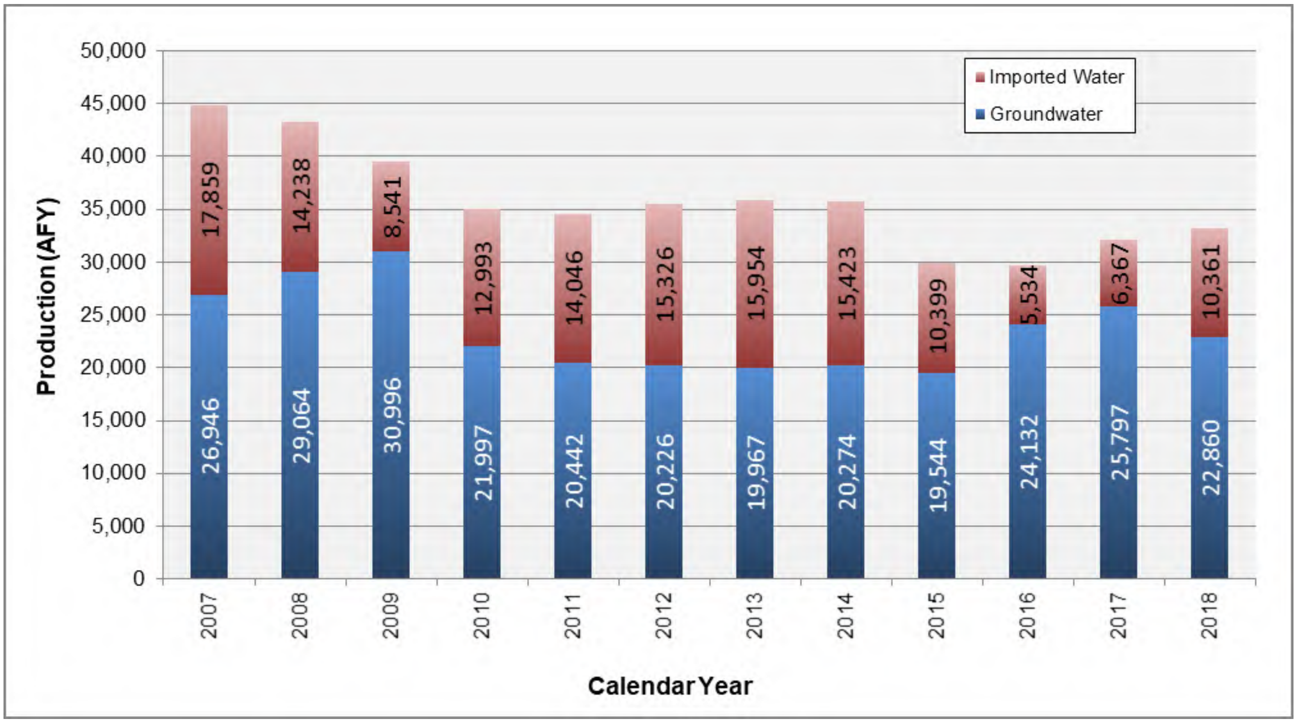

Figure 4-2

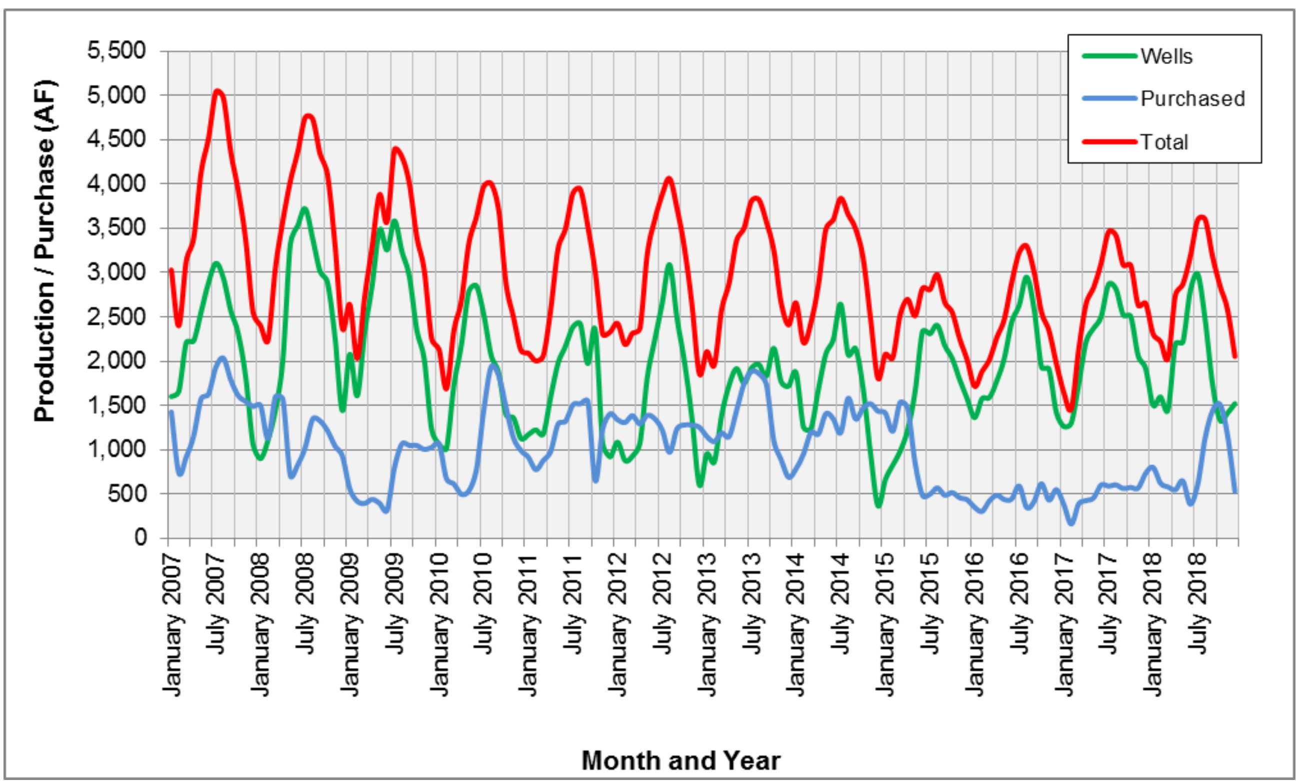
Historical Water Production and Purchase (Monthly)



4-2 Water Consumption versus Water Production / Purchase

The City typically purchases/produces more water than the quantity measured by the customer meters. Table 4-2 summarizes the difference between the measured consumption and production from 2007 to 2018. Figure 4-3 graphically shows the City's water consumption versus production/purchase.

Table 4-2

Water Consumption versus Water Production/Purchase

Calendar Year	Water Consumption[1] (AFY)	Water Production/ Purchase[2] (AFY)	Non-Revenue Water (%)	Population[3]	Per Capita Production/ Purchase (gpcd)	Per Capita Consumption (gpcd)
2007	44,286	44,806	1.2%	158,405	253	250
2008	42,072	43,302	2.8%	158,181	244	237
2009	37,708	39,537	4.6%	157,539	224	214

Average	**35,539**	**35,774**	**2.6%**	**162,498**	**197**	**196**

[1] *Consumption from annual Department of Water Resources Public Water System Statistics Report.*

[2.] *Water Production/Purchase data extracted from City's Anuual System Operations Data*

[3] *Population data from California Department of Finance, E-5 Population and Housing Estimates for Cities 2000-2018, excluding estimate of population for areas in Ontario served by CVWD.*

[4] *Water consumption estimates are from monthly water billing data.*

Per the historical records, the consumption between 2010 and 2012 was more than the amount of water produced and/or purchased, which could not have actually happened. Possible explanations for the discrepancy in data include the following:

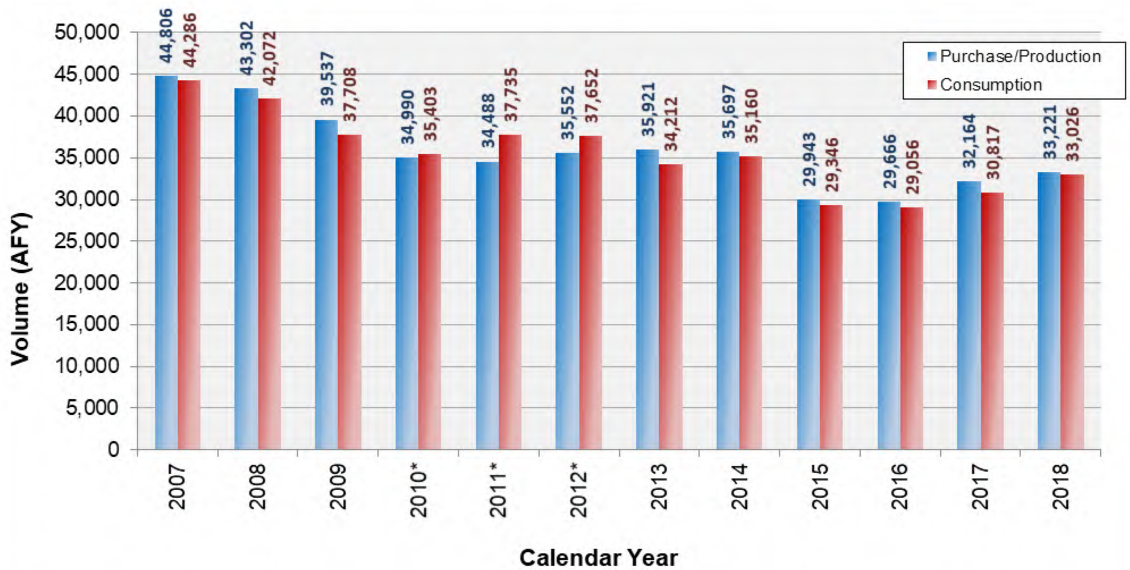
- During this time, the City was expanding its recycled water system. Some customers were converted from potable water use to recycled water use. Some of the consumption data might have actually been a combination of the potable and recycled water use.
- City staff has been updating and reclassifying meter types in its billing database. Some of the data provided in the historical DWR reports might have been misclassified at the time the report was created.
- Meters are not always perfectly calibrated. The margin of error in few large meters that measure production and purchase amounts or the thousands of small meters measuring consumption could contribute to the discrepancy in data.

The water consumption data before the 2015 Calendar Year is based on Department of Water Resources Public Water System Statistics Reports. After the 2015 Calendar Year, the consumption data is based on the monthly water billing data. Non-revenue water makes up between 0.6% and 4.8% of the total production and purchase supply, respectively. The City strives to keep the percentage as low as possible. The City's non-revenue water is 2.6%, on average.

Non-revenue water occurs in all water systems. There will be differences in the accuracies of the few large meters which measure purchases and production, and the thousands of small customer meters which measure sales. Non-revenue water can also be due to unmeasured uses such as water main flushing and other maintenance related tasks. The remainder may be due to leaks from the system. The City's average non-revenue water rate of 2.6%.

Figure 4-3

Water Consumption versus Water Production/Purchase



** Data discrepancy possibly doe to conversion of potable meters to recycled water system, reclassification of meters in billing database, and/or error in meter reads*

4-3 Water Demand Variations

Demand variations through a year are influenced by seasonal effects such as temperature, humidity, and precipitation. System demand variations throughout a day are influenced by the customer base and the daily lifestyles of the customers. In primarily residential areas, the peak demands within a day typically occur in the morning hours between 6:00 am and 9:00 am, when customers wake to begin their daily routine. In largely commercial and industrial areas, the peaks may occur mid-day or the demand may even remain relatively constant throughout the work day. For this study, the variations are expressed as a ratio to the average demand, with the average demand being equal to one.

For the purpose of this master plan, the average day demand was based on the most recent twelve consecutive months of production and purchase data that was available at the time the hydraulic model was created. The average day demand is summarized in Table 4-3.

Table 4-3
Average Day Demand for the Hydraulic Water Model

	AF	MGD	gpm
September 2018	3,179	34.53	23,980
October 2018	2,850	29.95	20,800
November 2018	2,583	28.06	19,483
December 2018	2,053	21.58	14,988
January 2019	1,915	20.13	13,980

July 2019	3,404	35.78	24,847
August 2019	3,479	36.57	25,397
Total	**31,153**	**27.76**	**19,280**

4-4 Monthly Demand Variations

Typical of most Southern California communities, the City's water consumption exhibits a distinct seasonal pattern. Peak and low monthly consumption occur during the dry summer months and wet winter months, respectively. Monthly demand totals and factors for 2007 to 2018 are shown in Table 4-4. Peak demands typically occur in July and August. Low demands typically occur in February. The highest and lowest monthly demand factor for the 2018 Calendar year is 1.46 and 0.82, respectively.

The maximum month factor is estimated to be 1.46 times the ADD, which is representative of the OMC demands, since there is very little existing usage in the OR area. The OR maximum day peaking factor was estimated to be 1.36, which was developed by excluding a portion of the water use that is expected to be served through the recycled water system.

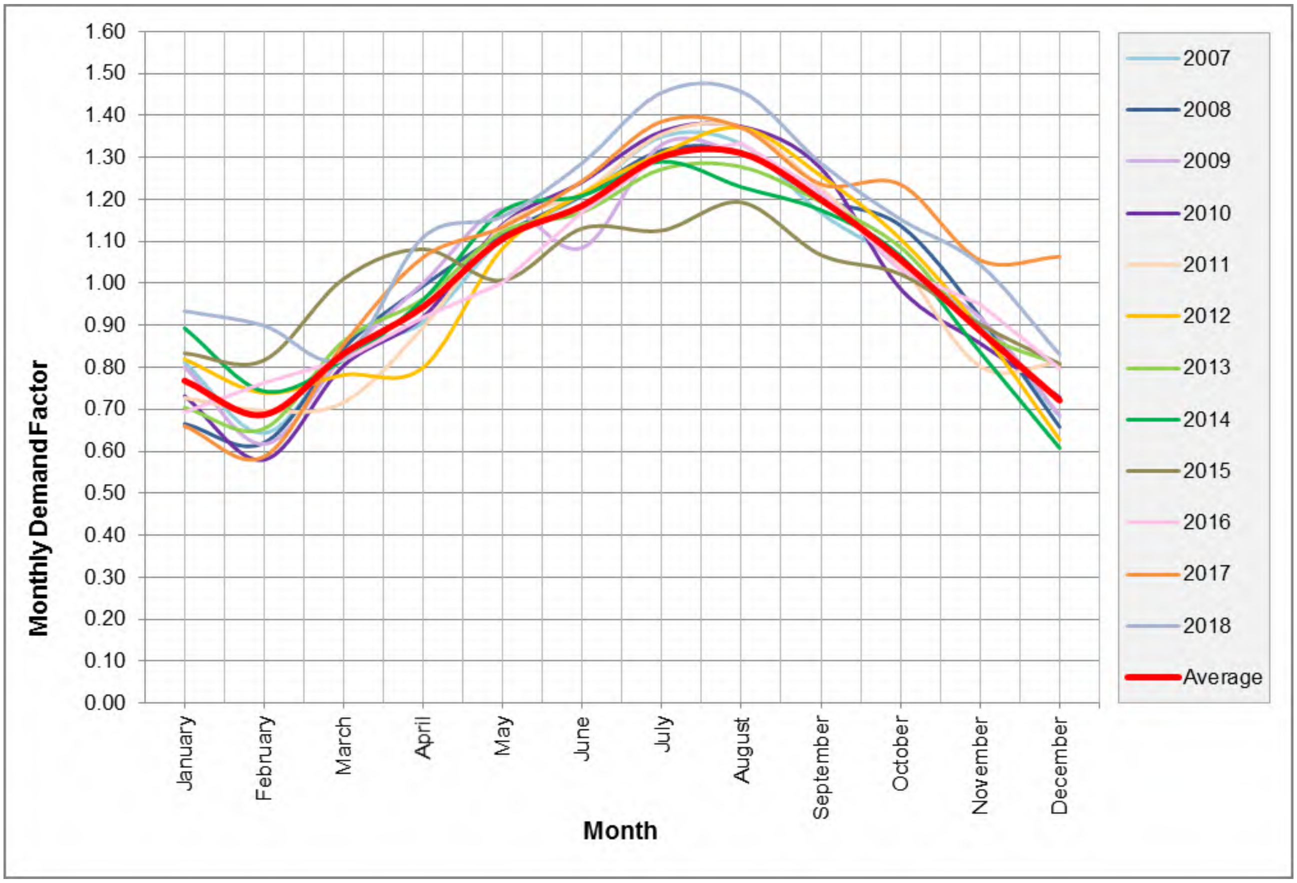
Figure 4-4

Monthly Demand Factors



4-5 Daily Demand Variations

In the predominately developed OMC service area, the MDD is estimated to be 1.60 times the ADD. The OR maximum day peaking factor was estimated to be 1.50, which was developed by excluding a portion of the water use that is expected to be served through the recycled water system. The MDD estimate is summarized in Table 4-5.

In the hydraulic model, demands and patterns for high water users were allocated based on field data that was captured during the calibration period. For modeling purposes, the calibration diurnal pattern and demands were used for the ADD and MDD scenarios.

Table 4-5

Maximum Day Demand Summary

	ADD (gpm)			MDD/ADD Peaking Factor	MDD (gpm)		
	Non-HWU	HWU[1]	Total		Non-HWU	HWU[1]	Total
Original Model Colony (OMC)	17,196	1,691	18,887	1.6	27,512	1,691	29,202
Ontario Ranch (OR)	391	2	393	1.5	586	2	588
Total	17,587	1,693	19,280		28,097	1,693	29,790

[1] *High water user demand and diurnal patterns are based on the calibration period*

4-6 Hourly Demand Variations

Knowledge of accurate demand variations over a 24-hour period is essential for proper analysis of water systems. For this study, diurnal use patterns were developed for each hydraulic zone. Customer specific diurnal patterns were developed for high water users. The development of diurnal use patterns are described in detail in Section 5 (Diurnal Patterns) of this report.

4-7 System Demands and Peaking Factors

It is important to evaluate a water system during various incremental peak demands. Typically, a water system is designed to meet the maximum demands placed on it. The system components must be designed to cope with these demands as they occur. Maximum month and maximum day demands are important factors in sizing a system's supply capability. Maximum day demands usually dictate the design criteria for both system transmission and storage needs. Peak hour criterion is a measure of the system's overall adequacy with respect to its transmission and distribution elements, as well as its operational storage capacity.

The peaking factors for Ontario Ranch (OR) was further refined to account for the fact that it is planned to be largely residential in nature and there were a dual recycled water system constructed in all major streets. The City anticipates a target of 12 percent of the total water use in low density residential areas to be provided by the recycled water system. It is expected that this percentage will increase as the residential density increases. With more recycled water and less irrigation use on the domestic water system, the peaking factors in OR are reduced as detailed in Table 4-6. These factors are utilized for future demand estimates in Ontario Ranch. The relationships between the peaking factors developed for this study with respect to the average day demand estimate are displayed graphically on Figure 4-5.

Table 4-6

Existing Water System Demands and Peaking Factors

Demand Description	OMC Demand	OR Demand	HWU Demand[1]	Total System Demand			(OMC) Peaking Factor	(OR) Peaking Factor	Total System Peaking Factor

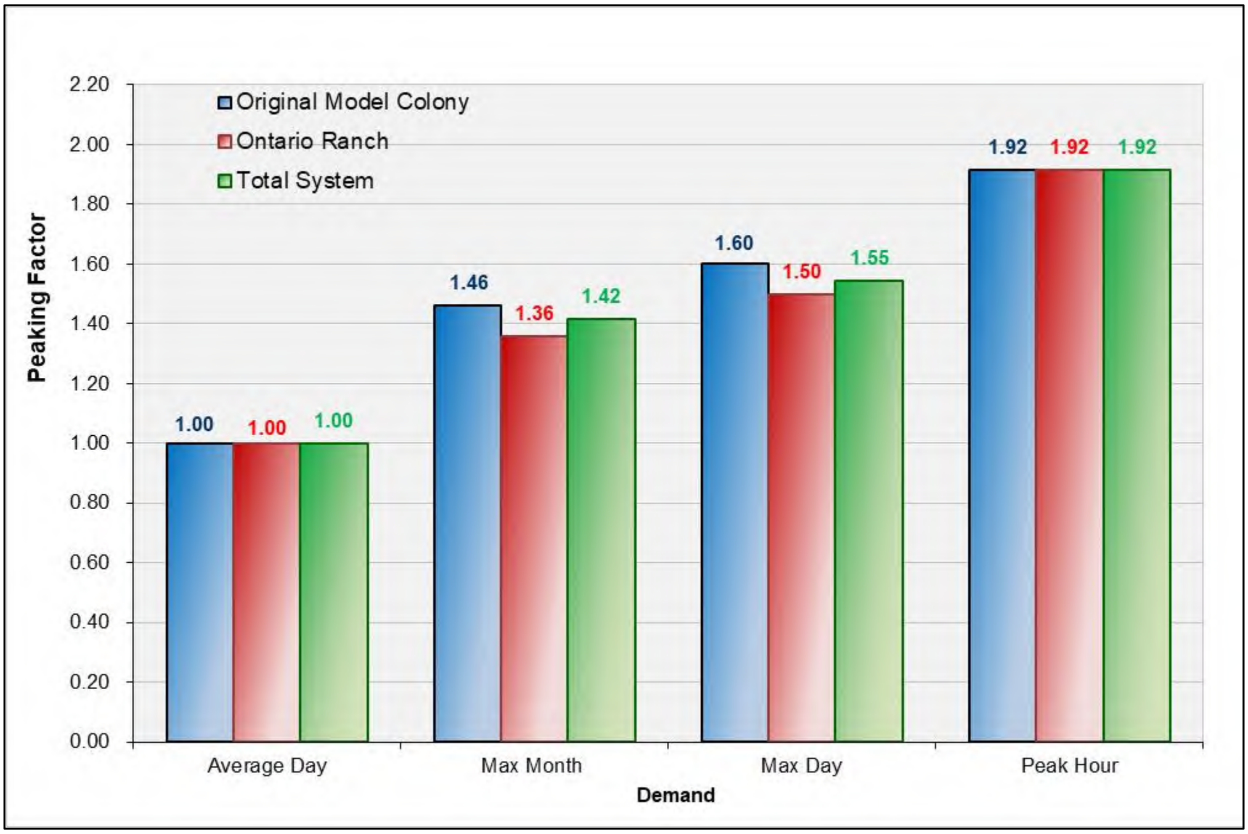
Figure 4-5

Water Demand Peaking Factors



4-7.1 Existing Demands

- **Average Day -** As detailed in Table 4-2, the average day demand is based on the City of Ontario's average daily production and purchase data between September 2018 and August 2019. As shown in Table 4-5, the average day demand is 31,153 AFY (19,280 gpm).
- **Maximum Month -** As detailed in Table 4-6, the maximum month peaking factor for OMC and OR are 1.46 and 1.36, respectively. The maximum month demand is estimated as 45,341 AFY (28,109 gpm).
- **Maximum Day -** As detailed in Table 4-6, the maximum day peaking factor for OMC and OR are 1.6 and 1.5, respectively. The maximum day demand is estimated as 48,051 AFY (29,790 gpm).
- **Peak Hour Demands -** Modeled peak hour demands were based upon the diurnal patterns that were developed for the hydraulic model, as detailed in Section 5. The overall peak hour system demand is estimated to be 1.98 times the average day demand or 61,656 AFY (38,224 gpm). This factor varies by zone depending on the diurnal patterns developed by zone, meter type, and for high water users.
- **Existing Water Demands by Zone -** Existing water demands by zone are shown in Table 4-5. These estimates are based upon the demand distribution generated from water billing historical data linked to the City's meter geodatabase. The average day demands (ADD) were distributed in the model using the 12-month consumption data from the City's billing department, adjusted to the most-recent production and purchase data (31,094 AFY; 27.8 mgd; 19,280 gpm) which takes into consideration non-revenue water.

  Generally, the ADD were increased with the factors included in Table 4-6 to develop the Maximum Day Demands (MDD), which are summarized by zone in Table 4-7. It should be noted that the MDD model demands for the high water users are based on actual field data collected during the calibration period, and they are not estimated with the MDD peaking factor included in Table 4-6. The MDD total 48,051 AFY (42.9 mgd; 29,790 gpm).

Table 4-7

Existing Water Demands by Zone

Zone	Average Day Demand				Maximum Day Demand[1]			
	gpm	mgd	AFY	% of Total	gpm	mgd	AFY	% of Total

Total	**19,280**	**27.76**	**31,098**	**100.0%**	**29,790**	**42.90**	**48,051**	**100.0%**

[1] *MDD for high water users model demands are based on actual field data collected, not MDD peaking factors included in Table 4-6*

4-7.2 Water Unit Demand Factors

Existing consumption data was used in this study to represent the water use of existing customers. For future developments, water unit demand factors were used to estimate future water use. Potable water unit demand factors are generally based on the factors that were developed as a part of a study completed in May 2016 entitled "*Ultimate Citywide Water Demand Estimate*".

The revised potable water unit demand factors are shown in Table 4-8.

The residential unit demand factors were first developed in terms of gpd/person. Then the maximum densities (people/du and du/ac) were applied to determine the factors in other units. The resulting unit factors in terms of gpd/du and gpd/ac represent the maximum expected demand factors.

The 2016 study included maximum residential densities in the Ontario Ranch area, which were based on historical development projections that were provided by the City's planning department. Some of the recent actual projections are higher than those included in the Ontario Plan, which needed to be updated to appropriately develop the demand factors and the future demand estimate.

Table 4-8

Potable Water Unit Demand Factors

[1] Max Density per the City's 2010 General Plan (The Ontario Plan) for OMC without recycled water. Density for LDR, LMDR, MDR, and HDR with recycled water (Ontario Ranch) were increased per the City Planning Department recommendation (March 2016).

[2] Density per the City's 2010 General Plan (The Ontario Plan)

[3] Unit Flow Factor Abbreviations:

ac = acre	*du = dwelling unit*	*gpd = gallons per day*
room = hotel/motel room	*stu = student*	*tsf = thousand square feet*

[4] If possible it is recommended to use 130 - 155 gpd/room on a case by case basis. It is difficult to estimate the number of rooms or square footage per acre.

[5] Mixed Use demands should be based on the types of landuse that make up the specific area and the unit demand factors provided above. The City's 2010 General Plan (The Ontario Plan) provides detailed information on the landuses that make up each mixed use area.

4-7.3 Future Demands

The City of Ontario's Future water system demands utilized in this study are detailed in Table 4-9 by zone. Generally, the ADD were increased with the factors included in Table 4-6 to develop the Maximum Day Demands (MDD), which are summarized by zone in Table 4-7. It should be noted that the MDD model demands for the high water users are based on actual field data collected during the calibration period, and they are not estimated with the MDD peaking factor included in Table 4-6. The MDD total 48,051 AFY (42.9 mgd; 29,790 gpm).

Table 4-9

Future Water demands by Zone

Zone	Average Day Demand				Maximum Day Demand[1]			
	gpm	mgd	AFY	% of Total	gpm	mgd	AFY	% of Total
1348	2,137	3.08	3,446	6.0%	3,398	4.89	5,481	6.2%
1212	11,298	16.27	18,224	31.6%	17,481	25.17	28,196	31.9%
1074	4,103	5.91	6,618	11.5%	6,361	9.16	10,261	11.6%
1010	6,292	9.06	10,149	17.6%	9,706	13.98	15,657	17.7%
925	11,886	17.12	19,172	33.3%	17,831	25.68	28,762	32.6%
Total	**35,716**	**51.43**	**57,610**	**100.0%**	**54,778**	**78.88**	**88,357**	**100.0%**

[1] MDD for high water users model demands are based on actual field data collected, not MDD peaking factors included in Table 4-6

The increase in future water demand is due to development of Ontario Ranch, anticipated densification in land use and population per the City's 2010 General Plan, and the assumption that the area within the service area will be fully occupied (vacant land will be built upon and occupied).

The total water maximum day demand for the future system is estimated 54,778 gpm (78.88 mgd; 88,357 AFY). This Subsection describes the process of developing the future system demands for the areas that are going to be developed or redeveloped and distributing the demands in the hydraulic model. The existing demands remained the same unless an area was going to be redeveloped.

In summary, the following steps were used to estimate the future demands:

1. Existing meter data was used for existing uses.
2. Used Water Demand Factors included in Table 4-7 to estimate demand for the vacant and future densification areas. In areas of redevelopment the existing demands were updated with the estimated flows for the future development.
3. The "City Buildout Table" approved in April 2015 (*Appendix 4-1*) provided the population and job estimates for all future mixed use areas as defined by the Ontario Plan (General Plan). The unit flow factors provided in Table 4-7 were used to estimate the total average day water demand for mixed use areas. Any existing water demands were deducted from the total future average water demand estimate. If the existing demands were greater than the calculated future demands, the existing water demand was maintained in the hydraulic model. The difference was then applied to the hydraulic model in the specific mixed use area.
4. In the Original Model Colony, future average water demands were calculated for currently vacant parcels, assuming that they will be developed in the future per the land use designated in the General Plan. The parcel acreage and the water demand factors provided in Table 4-7 were utilized to estimate the total water demand.
5. All available specific plans and other more current planning information were utilized for Ontario Ranch. The specific plan areas are shown on Figure 4-6. The City compiled the information and provided table specifying the proposed land uses (*Appendix 4-1: Ontario Ranch Proposed Land Uses per Specific Plans*). The detailed land use information and the water demand factors provided in Table 4-7 were utilized for calculating the future water demands. Demands were applied to the nearest model junction. If less than 50 percent of a specific plan area was constructed at the time of this study, all existing water demand was removed and replaced with the projected future water demand. If a specific plan area was mostly constructed, the difference in existing and future water demand was added to the model in that particular area.
6. On the west side of Ontario Ranch, where no specific plans yet exist, the future water demands were calculated utilizing the General Plan land uses, parcel acreages, and the water demand factors provided in Table 4-7. Demands were applied to the nearest model junction.

4-8 Recycled Water

The City's recycled water use was 9,653 AFY (3,042 gpm) in Fiscal Year 2018. The recycled water is supplied by Inland Empire Utilities Agency (IEUA). Recycled water from IEUA's treatment plants are conveyed through IEUA's pipe conveyance system to the City's recycled distribution system. According to the City's billing data, there are approximately 370 recycled customer meters in the City.

The City's Recycled Water Master Plan was last updated in April 2006. It is being updated concurrent to this master plan. Potable water customers that are anticipated to be converted to the recycled water system in the future will be identified as part of the recycled water master plan update.

4-9 Water Conservation

Title 6, Chapter 8A, The Emergency Water Conservation Plan of the City's Municipal Code addresses water conservation issues. The reference for this Chapter is Ordinance 2907, which became effective June 16, 2009.

Voluntary conservation is encouraged to limit the amount of water used to the amount absolutely necessary for health, business, and irrigation. The following elements of conservation apply at all times on a voluntary basis:

- Avoid hose washing of sidewalks, walkways, driveways, parking areas or other paved surfaces, except as required for sanitary purposes.
- Wash motor vehicles, trailers, boats and other types of mobile equipment using a hand held bucket or a hose equipped with a positive shutoff nozzle for quick rinses, or at the immediate premises of a commercial car wash or with recycled wastewater for approved uses.
- Avoid using water to clean, fill or maintain levels in decorative fountains, ponds, lakes or other similar aesthetic structures unless such water is part of a recycling system.
- Encourage restaurants, hotels, cafés, cafeterias or other public places where food is sold, served or offered for sale, to serve drinking water only to those customers expressly requesting water.
- Promptly repair all leaks from indoor and outdoor plumbing fixtures.
- Avoid watering lawn, landscape or other turf area more often than every other day and during the hours between 6:00 a.m. and 6:00 p.m.
- Avoid causing or allowing the water to run off landscape areas into adjoining streets, sidewalks or other paved areas due to incorrectly directed or maintained sprinklers or excessive watering.

The City maintains water conservation information on their website for viewing by the public. Information includes water use efficiency and conservation tips, links to other websites pertaining to water conservation, and links to IEUA's website where indoor and outdoor rebates are offered for residents of the IEUA service area. Indoor and outdoor rebates are also offered to commercial businesses

4-9.1 California Water Conservation

A variety of executive orders have been issued since 2009 regarding water conservation in the state of California. The following is a brief summary:

1. **November 2009 – Senate Bill SBx7-7 (i.e. The Water Conservation Act of 2009) enacted**
   - Requires State of California Department of Water Resources (DWR) in consultation with other state agencies, to develop a single standardized water use reporting form that can be used by both urban and agricultural water agencies.
   - For urban water conservation, the legislation sets an overall goal of reducing per capita urban water use by 20 percent by December 31, 2020.
2. **April 2014 Proclamation**
   - Governor declares a drought State of Emergency to exist in California due to severe drought conditions.

- Calls on Californians to reduce their water usage by 20 percent.
- Suspends California Environmental Quality Act to allow the emergency regulation and other actions to take place as quickly as possible

3. **December 2014 - Executive Order B-28-14**
   - Extends the California Environmental Quality Act suspension through May 2016
4. **April 2015 - Executive Order B-29-15**
   - Imposes restrictions on urban water suppliers to achieve a statewide 25 percent reduction in potable urban usage through February 2016
   - Requires commercial, industrial, and institutional users to implement water efficiency measures
   - Prohibits irrigation with potable water of ornamental turf in public street medians
   - Prohibits irrigation with potable water outside newly constructed homes and buildings that is not delivered by drip or microspray systems
   - Directs urban suppliers to develop rate structures and other pricing mechanisms to promote water conservation
   - Requires urban suppliers to increase enforcement against water waste
5. **November 2015 – Executive Order B-26-15**
   - Directs State agencies to prioritize and accelerate approvals for projects that enhance the ability of a local or state agency to capture high precipitation events
   - Extends drought restrictions through October 2016
6. **May 2016 - Executive Order B-37-16**
   - Aims to bolster California's climate and drought resilience by instructing State agencies to help Californians adopt permanent changes to use water more wisely.
   - Directs the State Water Resources Control Board to develop new mandatory water conservation regulations
   - Directs the Department of Water Resources to update new water use targets for urban water agencies. These new targets will build upon the existing requirement to achieve 20% reduction in usage by 2020. The executive order states that new targets would be developed no later than 2020, with the goal of reaching full compliance by 2025.
   - Directs the State Water Resources Control Board to eliminate water waste by
     - **i.** permanently prohibits practices that waste potable water
     - **ii.** directing actions to minimize water system leaks
     - **iii.** directing urban and agricultural water suppliers to accelerate data collection, improve water system management and prioritize capital projects to reduce water waste
   - Directs the Department of Water Resources to strengthen local drought resilience by updating requirements for Water Shortage Contingency Plans
   - Directs the Department of Water Resources to improve agricultural water use efficiency and drought planning
7. **April 2017 – Executive Order B-40-17 was issued**
   - Terminates the January 17, 2014 Drought State of Emergency
   - Rescinds Executive Orders B-26-14, B-28-14, B-29-15, and B-36-15

- Most of Executive Order B-37-16 (Making Water Conservation a California Way of Life) remains in full force. The Department of Water Resources and State Water Resources Control Board continues to:

  i. develop permanent prohibitions on wasteful water use and requirements for reporting water use by urban water agencies. Permanent restrictions include:

  - ✓ Hosing off sidewalks, driveways and other hardscapes
  - ✓ Washing automobiles with hoses not equipped with shut-off nozzle
  - ✓ Using non-recirculated water in a fountain or other decorative water feature
  - ✓ Watering lawns in a manner that causes runoff, or within 48 hours after measurable precipitation
  - ✓ Irrigating ornamental turf on public street medians

  ii. develop standards that urban water suppliers will use to set new urban water use efficiency targets

  iii. direct actions to minimize water system leaks that waste large amounts of water.

  iv. direct urban and agricultural water suppliers to accelerate their data collection, improve water system management, and prioritize capital projects to reduce water waste

  v. work with agencies and suppliers to identify mechanisms that would encourage and facilitate the adoption of rate structures and other pricing mechanisms that promote water conservation

8. Assembly Bill No. 606 – May 31, 2018

- authorizes State Water Resources Control Board (SWRCB), along with the Department of Water Resources (DWR) to issue regulation requiring wholesale water suppliers, urban retail water suppliers, or distributors of public water supply to submit information relating to water production, water use, or water conservation.
- require urban water suppliers to submit a urban water usage objective report by November 1, 2023
- updates the requirements of the urban water management plans

9. Assembly Bill No. 1668 – May 31, 2018

- authorizes State Water Board, along with the Department of Water Resources (DWR) to issue regulation requiring wholesale water suppliers, urban retail water suppliers, or distributors of public water supply to submit information relating to water production, water use, or water conservation.
- establishes 55 gallons per capita daily as the standard for indoor residential water use beginning January 1, 2025 and 50 gallons per capita daily beginning January 1, 2030
- require DWR and SWRCB to adopt standards to monitor the performance of commercial, industrial, and institutional water use.
- Includes penalties of $1,000 to $10,000 per day to the water supplier for violations to this order

SECTION 5

DIURNAL PATTERNS

5-1 General

Knowledge of accurate demand variations over a 24-hour period is essential for proper analysis of water systems. For this study, 15-minute demand variations were represented by the development of diurnal demand patterns based on recorded field data. The diurnal demand patterns are used to develop an extended period hydraulic model simulation. The model analysis is used to determine the adequacy of the sources of supply, pumping facilities, reservoirs, and the transmission / distribution facilities. For this study, diurnal patterns were created for each hydraulic pressure zone for residential usage, non-residential usage, and high water users (HWUs).

5-2 Diurnal Patterns Areas

SCADA data was collected from April 8, 2019 to April 22, 2019. An electronic database with the following information for each facility was provided for use in developing the diurnal patterns.

1. Reservoirs – levels
2. Booster Pump Stations – total flow
3. Wells – flow
4. Turnouts - flow
5. Flow Control Facilities - flow

The SCADA information was utilized in calculating the demands for each diurnal pattern area in 15 minute increments over a typical 24-hour period (average weekday excluding days with odd usages and/or missing data). Diurnal patterns were based on data for April 18, 2019, for each of the following pressure zones:

1. 925 Zone
2. 1010 Zone
3. 1074 Zone
4. 1212 Zone
5. 1348 Zone

It should be noted that the diurnal patterns start at 12 am and end at 12 am of the following day. As the model runs, the first time step represents 12 am midnight.

The mass balance of the supply in, flow out, and change in reservoir level for each of the hydraulic pressure zones is summarized in Table 5-1. The diurnal patterns for each of the five pressure zones are shown on Figure 5-1.

Section 5-3 to Section 5-5 detail the processes used to develop use patterns for residential, non-residential, and high water users.

[1] *Well is currently inactive, but could be placed back in service*

[2] *Well use is restricted due to high operation and energy costs*

[3] *Well usage is restricted due to water quality*

[4] *Ion exchange treatment is necessary*

5-3 Residential Diurnal Patterns

The service area is predominately residential to the west and industrial to the east. To account for the variations in usage by type, diurnal patterns were developed for the residential customers.

Automatic meter infrastructure (AMI) data was gathered for approximately 4,000 meters, which were predominately single family residential meters located in the OMC area. Multi-family residential usage was not included with the residential diurnal pattern, since there was limited AMI data and its usage pattern was not consistent with the single family residential use patterns. Hourly data was gathered between April 8, 2019 and April 22, 2019. The residential diurnal pattern was developed for each pressure zone by summarizing the total residential water usage for each hour for the April 18, 2019 calibration day. The residential diurnal patterns for each pressure zone are detailed on Figure 5-2.

During the calibration period, the demands in the 925 Zone were only 282 gpm (455 AFY), as detailed in Table 4-7. The existing land use is predominately residential, with several large developments that were under construction at that time. It is understood that the diurnal pattern developed from the mass balance estimate is representative of residential land use, and it is used for model calibration and existing system analyses. As illustrated on Figure 5-1, the residential demand factor variation in the 925 Zone is greater than those developed for the other zones. This difference can be attributed to the overall low demand in this zone, which may be heavily influenced by several high water users. As the development in the 925 Zone is expanded, the intermittent peaks will lessen as the future customer's peak usage offset each other to develop a more appropriate diurnal pattern. For the future demand scenario, the 1010 Zone residential diurnal pattern was applied to the residential customers in the 925 Zone. As development expands and becomes occupied, it is recommended that the City reevaluate the residential diurnal patterns in the 925 Zone, and make model updates, as necessary.

5-4 Non-Residential Diurnal Patterns

To create the non-residential patterns for each pressure zone, the residential use were subtracted from the total use patterns for each zone over the 24-hour period. In addition, the demand for customers with high water use were also excluded when developing the non-residential diurnal pattern, since diurnal patterns were developed specifically for each of these high water use customers. Multi-family residential usage was included in the non-residential diurnal pattern, since there was limited AMI data and its usage pattern was not consistent with the residential use patterns. The non-residential diurnal patterns for each pressure zone are detailed on Figure 5-3.

During the time of calibration, there was insufficient non-residential usage within the 925 Zone. For the future demand scenario, the 1010 Zone non-residential diurnal pattern was applied to the residential customers in the 925 Zone. As development expands and becomes occupied, it is recommended that the City reevaluate the residential diurnal patterns in the 925 Zone, and make model updates, as necessary.

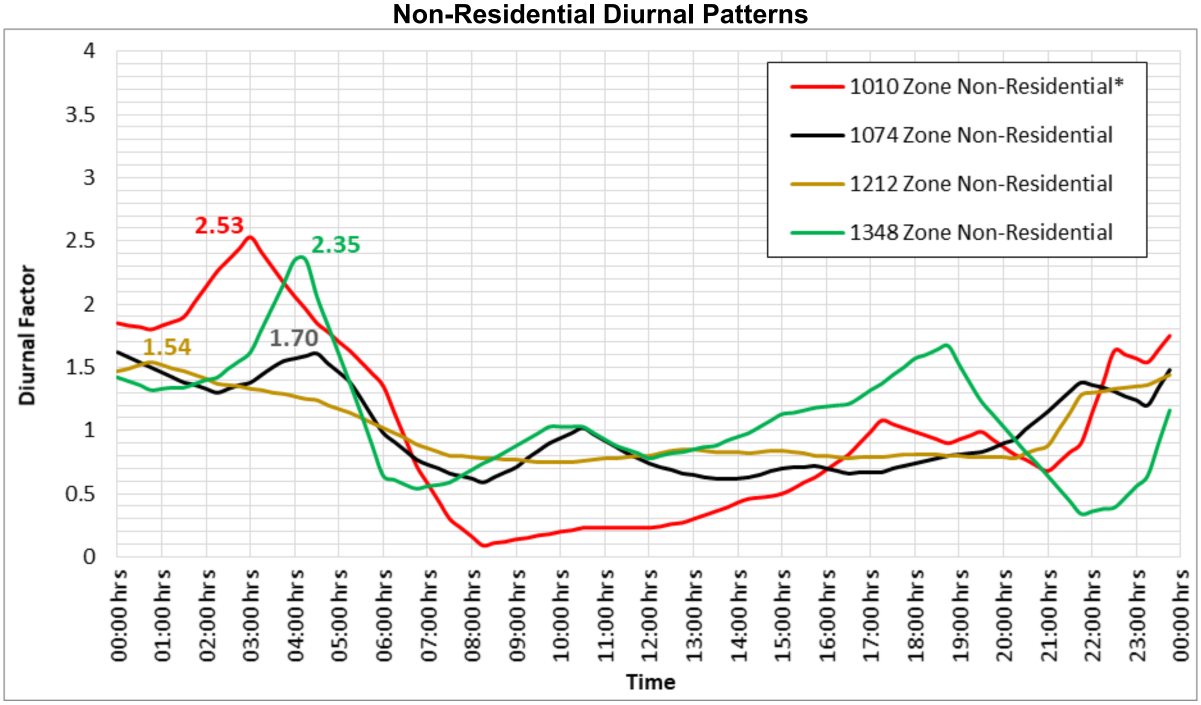
**Future 925 Zone demands are represented with the 1010 Zone diurnal pattern.*

Figure 5-3

Non-Residential Diurnal Patterns



**Future 925 Zone demands are represented with the 1010 Zone diurnal pattern.*

5-5 High Water User Diurnal Patterns

To further refine the demand distribution, specific diurnal patterns were developed for the customers with the highest water use. Billing records from 2016 were reviewed to identify the high water use customers. To capture the total flow for some of these customers, multiple meters were needed. Automatic meter reading (AMR) data was gathered by the City's operations staff. Data was captured in hour increments between April 8, 2019 and April 22, 2019. The summary of high water user location is detailed on Figure 5-4, and summarized in Table 5-2. Specific use patterns for these high water users is detailed in Appendix 5-1.

SECTION 6
EXISTING SYSTEM

6-1 General

According to the City's Water Geodatabase from March 2019, the City's existing domestic water system consisted of the following:

- Five (5) primary pressure zones (925, 1010, 1074, 1212, and 1348 Zones)
- Over 3.1 million feet (584 miles) of transmission and distribution pipe, 2 inches through 42 inches in diameter
- 7,277 fire hydrants
- 35,906 water meters
- Seventeen (17) active wells
- Twelve (12) reservoirs with a total volume of 75 MG
- Six (6) active booster pump stations
- Fifteen (15) pressure reducing stations
- Two (2) connections to Water Facilities Authority
- Five (5) connections to Chino Desalter Authority
- Two (2) inter-agency connections
- Two (2) Ion Exchange Treatment Facility
- Four (4) altitude valves

A breakdown of the water meters by customer classes are shown in Table 6-1.

The existing domestic water system is shown on Figure 6-1. The hydraulic schematic of the existing water system is shown on Figure 6-2.

Table 6-1
Potable Water Meter Type

Meter Type	Number of Meters
Residential	28,906
Multifamily Residential	2,014
Irrigation	1,192
Commercial	2,999
Industrial	337
Departmental/Government	294
Hydrant (Construction)	164
Total	**35,906**

6-2 Pressure Zones

The existing system is divided into the five (5) pressure zones entitled: 925 Zone, 1010 Zone, 1074 Zone, 1212 Zone, 1348 Zone. It should be noted that the 925 Zone has very minimal existing demands. The 925 Zone will serve the future OR developments. The largest pressure zone in the system is the 1212 Zone, which covers about 38 percent of the existing water service area. A summary of all pressure zones are detailed in Table 6-2.

Table 6-2
City of Ontario Pressure Zones

Pressure Zone Name[1]	Area (sq. mi.)	Area (Ac)	Pipe Length (ft)	Hydraulic Grade Line (ft)	Ground Elevation Range (ft)	Static Pressure Range[2] (psi)
1348	3.0	1,913	365,426	1,348	1036 - 1177	74 - 135
1212	18.7	11,952	1,271,132	1,212	860 - 1096	50 - 152

WATER MASTER PLAN

Existing Water System
Hydraulic Schematic

Figure 6-2

6-3 Transmission and Distribution System

The potable water system includes approximately 584 miles of transmission and distribution pipe that is ranging in size from 2-inches through 42-inches. A summary of the system pipes by diameter, material, and date of construction is shown on Figure 6-3, Figure 6-4 and Figure 6-5, respectively.

Figure 6-3

Length of Pipe by Size

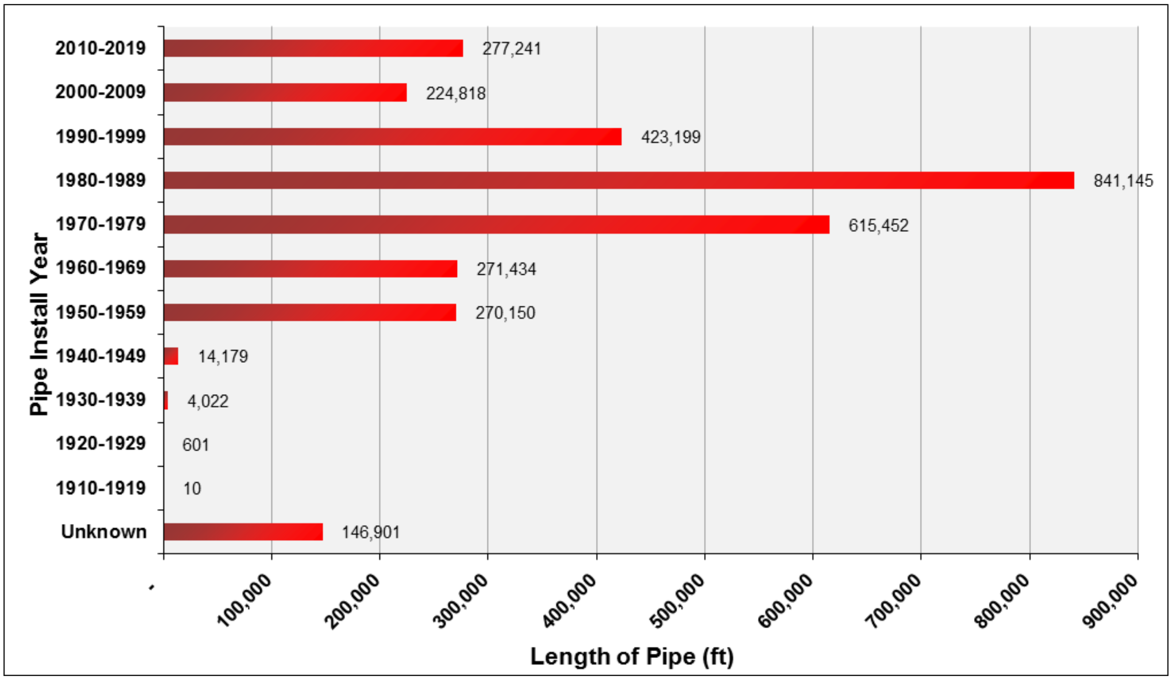
Length of Pipe by Decade of Construction



6-4 Wells

The total well capacity is about 38,600 gpm or 55.6 mgd. Well information and characteristics are provided in Table 6-3. There are currently seventeen (17) active wells.

The following wells are active but may either require treatment or are unreliable due to poor water quality.

- Wells 29 and 31 production need to be treated for nitrates, which requires higher costs for production. Currently, the City only uses these wells as needed during the warmer high demand periods.
- Well 35 is not reliable. In the past, this well did not meet the minimum water quality requirements and could not be used. As of September 2019, the samples passed all regulations and Well 35 was operating continuously.
- Well 40 needs to be treated for perchlorate, which requires higher costs for production. Currently the City only uses this well as needed during the warmer high demand periods.
- Recently treatment processes added to Well 41 have allowed the City to use this source consistently.
- Wells 44 and 52 are treated for nitrate and perchlorate removal by the Dry Year Yield Ion Exchange Plant.
- Wells 37 is currently not used due to water quality. It is scheduled to be placed back in service once additional treatment is provided. The discharge piping for Well 37 will connect to the 1010 Zone instead of the 1212 Zone.
- Well 39 is active, but placed out of service, due to poor water quality. It is scheduled to be placed back in service once additional treatment is provided.

The status of the inactive wells is summarized below:

- Well 20 and 27 are physically separated from the system, and are on the City's standby status. These wells were put on emergency use only due to their age and their low production. These wells could be rehabilitated and reconnected to the system if needed. These wells are not planned to be upgraded in the future.

- Wells 50 is currently inactive due to water quality. It is planned to be placed back in service once additional treatment is provided.
- Wells 34 is currently inactive due to 1,2,3 Trichloropropane (TCP). This well is not planned to be placed back in service.
- The pump at Well 25 has burned up, and the City does not plan to reactivate this well, at this time.

Additional information regarding the wells is as follows:

- Well 11 was constructed in 1958. It is located at the Ontario International Airport property. While the water quality meets the primary and secondary standards, it produces sand even after a new sand separator was installed in 2003. It is inactive and will be abandoned.
- Well 16, constructed in 1960, is inactive due to the production of sand and traces of oil from the oil-lubricated pump. There are no plans to reactivate this well.
- Wells 3, 4, 9, 15, 17, and 19, have been abandoned and Well 18 was destroyed due to high nitrates and perchlorates, and facility condition.
- Well 3 (1962) and Well 4 (1919) were abandoned due to high levels of nitrate and perchlorate. These wells had also exceeded their useful lives. The production of Wells 3 and 4 were replaced by Wells 44 and 52.
- Well 9 was abandoned due to high nitrates and perchlorates. The Well 9 property is large enough for the construction of a new well and a treatment facility.
- Well 15 was abandoned due to high nitrates and perchlorates.
- Wells 26 is currently inactive and will be abandoned.

6-5 Reservoirs

The City's water system includes twelve (12) reservoirs ranging in capacity from 2 million gallons to 20 million gallons. The City's total reservoir capacity is currently 75 MG, of which approximately 32 MG is within the 1212 Zone. The hydraulic gradient in each pressure zone is controlled by the high water elevation of the reservoirs that feed the zones by gravity. The characteristics of each existing storage reservoir are shown in Table 6-4.

All the existing reservoirs are less than 65 years old with the exception of Reservoir 1212-3, which was constructed in 1926. The average life expectancy of concrete reservoirs and steel tanks is about 100 years, provided that reservoirs are properly maintained and repainted or recoated every 15-20 years. Thus, most of the City reservoirs are expected to be in fairly good condition and no improvements based on age are recommended except for Reservoir 1212-3, due to its age and condition.

6-6 Booster Pump Stations

The City's system includes five (5) booster pump stations. Details of each booster station are summarized in Table 6-5.

The John Galvin Pump Station is adjacent to the 1074 Zone reservoirs, east of Cucamonga Avenue and south of Fourth Street. It was constructed in 1960. It takes suction from the 1074 Zone. Booster Pump Galvin 1074-1, Galvin 1074-2, and Galvin 1074-3 are vertical turbine pumps that pump into the 1212- Zone. Booster Pump Galvin 1074-4 is a vertical turbine pump that pumps into the 1348 Zone. Currently, these pumps are rarely used.

The booster pump station housing booster pumps 1348-3 and 1348-4 is located adjacent Reservoir 1212-3, on Campus Avenue, north of Eighth Street. It was constructed in 1959 and rehabilitated in 2004. It takes suction from Reservoir 1212-3. There are two horizontal split case pumps that pump into the 1348 Zone.

The booster pump station housing booster pumps 1348-1 and 1348-2 is located east of Euclid Avenue just south of the I-10 Freeway. It was constructed in 1960. It takes suction from the 1212 Zone. There are two horizontal split case pumps that pump into the 1348 Zone.

The Ontario Booster Pump Station was constructed in 2008 and is located at 4251 East Jurupa Avenue, east of Dupont Avenue. It currently takes suction from Reservoir 925-2A, which was constructed to ultimately serve the 925 Zone (Ontario Ranch). Currently, there is little demand in New Model Colony. Per the “take or pay” agreement with CDA, the City tries to utilize 8,533 AFY from CDA, which is routed through the 925 Zone. Historically, the imported water supply has exceeded the 925 Zone demand, and the Ontario Booster Pump Station was constructed to move this water to the 1212 zone, which has an abundance of storage.

Milliken Booster Pump Station is located at 4301 E. Guasti Road, east of Milliken Avenue. It currently takes suction from Reservoir 1010-2A and Reservoir 1010-2B. Per the “take or pay” agreement with CDA, the City tries to utilize 8,533 AFY, which can be served to the 1010 Zone through CDA 2, Lateral D. As the imported water supply can exceed the total 1010 Zone demand, and the Milliken Booster Pump Station was constructed as a way to move the imported water to the 1212 Zone, which has an abundance of storage

6-7 Pressure Reducing Stations

The City’s system includes fifteen (15) pressure reducing stations (PRS), The details of each PRS are shown in Table 6-6. Most of the stations have two or more pressure reducing valves (PRVs), a main valve and one or more bypass valves. The main valve, the smallest in diameter, typically has the highest pressure setting. Bypass valves are larger in diameter and have slightly lower pressure settings than the main valve. The bypass valve will open when the system pressure drops below the main valve’s pressure setting and the main valve cannot supply enough water. If the downstream pressure continues to fall below the bypass valve pressure setting, the second bypass valve will open to provide additional water.

Pressure relief valves are present at PRS4, PRS12, and PRS13. These valves protect the water system from abnormally high pressures should the reducing valves fail to work properly.

Table 6-6

Existing Pressure Reducing Stations Summary Table

Station No.	From Zone	To Zone	Location	Diameter (inch)	Pressure Setting (psi)	Ground Elevation (feet)	Model ID

6-8 Altitude Valves

The existing system has four (4) altitude valves that regulate reservoir operations. The altitude valves are operated based on levels in City reservoirs. Details are shown in Table 6-7.

Table 6-7

Altitude Valves

ID	From Zone	To Zone	Location	Model ID	Diameter
AV-1010-2	1212	1010	Reservoir 1010-2A & 1010-2B	WMP2019_VL00003_ALT_1212_1010	12

6-9 Imported Water Connections

The City has two (2) Water Facilities Authority (WFA) turnouts and five (5) points of connection with the Chino Basin Desalter Authority (CDA). The locations and details are listed in Table 6-8.

Table 6-8

Imported Water Connections

ID	To Zone	Location	Model ID	Connection Comment	Supply Agency Comment
WFA Turnout 1	1212	Northwest corner of Eighth St and Fern Ave (adjacent Reservoir 1212-1A and 1212-1B)	E12PR101_WFA_1	16 mgd (16,800 AFY) Capacity	City plans for 15 mgd (17,900 AFY) maximum to be taken from turnout.
WFA Turnout 2	1348	Southeast corner of Campus Ave and A St (adjacent Reservoir 1212-3)	WMP2019_VL00001_WFA_2	9 mgd (10,100 AFY) Capacity. This supply can be directed into the 1212-3A Reservoir through WFA 2A. This flow can be directed into the 1212-3A Reservoir through WFA 2A	
CDA I[1]	1010	Intersection of Archibald Ave and extension of Schaefer St	WMP2019_VL00009_CDA_1	Blend of CDA II water and JCSD Water. Not used much due to additional pumping cost and water quality concerns.	CDA entitlement is 8.6 MGD (8,533 AFY) through CDA I and CDA II combined.
CDA II - Lat A[2]	925	Intersection of Philadelphia St and Milliken Ave	WMP2019_VL00006_CDA_2_LAT_A	Blend of CDA II water and JCSD Water. Currently not used much, since Laterals C and D are a direct connection to CDA II.	
CDA II - Lat B[2]	1010	Intersection of Philadelphia St and Milliken Ave	WMP2019_VL00005_CDA_2_LAT_B		
CDA II - Lat C[2]	925	Intersection of Riverside Dr and Milliken Ave	WMP2019_VL00007_CDA_2_LAT_C	Newly constructed connection provides the majority of the CDA supply.	
CDA II - Lat D[2]	1010	Intersection of Riverside Dr and Milliken Ave	WMP2019_VL00008_CDA_2_LAT_D		

[1] CDA I is the Chino Basin Desalter Facility No. 1

[2] CDA II is the Chino Basin Desalter Facility No. 2

6-10 Inter-Agency Connections

The City's water system has two (2) inter-agency connections with neighboring cities or water utilities. These inter-agency connections allow the City to obtain water from or provide water to adjacent water systems. The inter-agency connections and their locations are listed in Table 6-9.

Table 6-9

Inter-Agency Connections

No.	Location	From	To	Connection Size (in)	Comments
1	Milliken Ave & 4th St.	CVWD	City of Ontario 1212 Zone	4" and 8"	PRS 14
2	Benson Ave & State St	City of Ontario 1212 Zone	City of Chino	10	Connected to City of Chino Reservoir

6-11 Water Treatment

Operated by the City for over thirty (30) years to treat raw Colorado River water from the MWD Upper Feeder, the John Galvin Water Treatment Plant was deactivated in 1993 because the treatment process did not meet the requirements of the Surface Water Treatment Rule.

As a part of participating in the DYY program, the John Galvin Water Treatment Plant site (southeast corner of Cucamonga Avenue and Fourth Street) was chosen for the location of a new ion-exchange facility. The John Galvin Ion Exchange Treatment Facility was commissioned on April 29, 2009. The treatment facility extracts raw groundwater with nitrate and perchlorate concentrations in excess of or near 80% of the MCL from either Well 44 and Well 52. The City's domestic water supply permit allows the operation of either Well 44 or Well 52 or both wells at once, depending on the water quality concentrations experienced when the facility is in operation. The facility's final chlorinated product is comprised of a small portion of raw water (either Well 44 or Well 52 or both wells, depending at the time of operation) that is bypassed and blended with treated water from the treatment facility before delivery into Reservoirs 1074-1A & 1074-1B. In addition, the facility includes a bypass blending system where the facility's final chlorinated product can be blended with Zone 1212 water prior to entering Reservoirs 1074-1A and 1074-1B. The maximum well water concentrations are 70 milligrams per liter (mg/L) nitrate and 8 micrograms/L (µg/L) perchlorate. The treatment facility's final chlorinated product has nitrate concentrations, on average of 25 mg/L and perchlorate concentrations of 2.8 (µg/L), on average.

SECTION 7

CRITERIA

7-1 General

Performance criteria are established to evaluate the adequacy of various water system components through a systematic analysis. Necessary improvements are identified and recommended for inclusion in a Capital Improvement Program (CIP). Some criteria are based upon experience and their application is at the discretion of the water purveyor. This includes service pressures, storage capacity, and sources of supply. Other criteria, such as water quality and fire protection, are based on federal, state and local jurisdictional requirements. This section details the criteria which will serve as the benchmark for evaluating the City's water system. A summary of the service criteria is listed in Table 7-1.

Table 7-1

Service Criteria

Description	Criteria	Existing Requirement	Future Requirement
1. Source of Supply			
a. Total	Maximum Day Demand (except for closed zones which shall be Maximum Day Demand plus Fire Flow Demand or Peak Hour, whichever is greater)	29,790 gpm	54,780 gpm
b. Local Supply	Average Day Demand	19,280 gpm	35,700 gpm
2. Reservoir Capacity			
a. Operational Storage	30% of Maximum Day Demand for the OMC and 25% of Maximum Day Demand for Ontario Ranch	TBD	TBD
b. Emergency Storage	100% of Average Day Demand	27.8 mg	39.7 mg
c. Fire Suppression	Highest Fire Flow Requirement		
Residential			
Rural	1,500 gpm for 2 hours	0.18 mg	0.18 mg
Low Density	1,500 gpm for 2 hours	0.18 mg	0.18 mg
Low-Medium Density	1,500 gpm for 2 hours	0.18 mg	0.18 mg
Medium Density	2,000 gpm for 2 hours	0.24 mg	0.24 mg
High Density	3,500 gpm for 4 hours	0.84 mg	0.84 mg
Retail / Service			
Neighborhood Commercial	2,500 gpm for 3 hours	0.45 mg	0.45 mg
General Commercial	3,000 gpm for 3 hours	0.54 mg	0.54 mg
Office Commercial	3,000 gpm for 3 hours	0.54 mg	0.54 mg
Hospitality	4,000 gpm for 4 hours	0.96 mg	0.96 mg
Employment			
Business Park	3,000 gpm for 3 hours	0.54 mg	0.54 mg
Industrial	4,000 gpm for 4 hours	0.96 mg	0.96 mg

Table 7-1

Service Criteria (continued)

Description	Criteria	Existing Requirement	Future Requirement
Other			
Airport	4,000 gpm for 4 hours	0.96 mg	0.96 mg
Mixed Use	3,500 gpm for 4 hours	0.84 mg	0.84 mg
Open Space	1,500 gpm for 2 hours	0.18 mg	0.18 mg
Public Facility	3,000 gpm for 3 hours	0.54 mg	0.54 mg
Public School	2,500 gpm for 3 hours	0.45 mg	0.45 mg
3. Booster Pump Stations	➢ Capable of delivering Maximum Day Demand plus Fire Flow or Peak Hour Demand of service area, whichever is greater ➢ Stand-by pump equal in size to the largest duty pump ➢ Flow meters, suction and discharge pressure gauges, and telemetry equipment for alarm and status notification at each station ➢ Provisions for emergency power at all stations		
4. Minimum Pipe Size	12-inch in commercial and industrial areas 8-inch in all other areas		
5. Maximum Velocities	➢ 5 ft/s at Average Day Demand ➢ 7 ft/s at Maximum Day Peak Hour Demand (5 ft/s for PVC pipe) ➢ 10 ft/s at Maximum Day plus Fire Flow Demand		
6. Static Pressures	➢ Minimum 40 psi ➢ Desired 60 - 80 psi ➢ With pressure regulation over 80 psi		
7. Dynamic Pressures	Minimum 40 psi during Peak Hour Demand		
8. Fire Flows and Pressures			
Residential			
Rural	1,500 gpm for 2 hours with 20 psi residual pressure at fire hydrant		
Low Density	1,500 gpm for 2 hours with 20 psi residual pressure at fire hydrant		
Low-Medium Density	1,500 gpm for 2 hours with 20 psi residual pressure at fire hydrant		
Medium Density	2,000 gpm for 2 hours with 20 psi residual pressure at fire hydrant		
High Density	3,500 gpm for 4 hours with 20 psi residual pressure at fire hydrant		
Retail / Service			
Neighborhood Commercial	2,500 gpm for 3 hours with 20 psi residual pressure at fire hydrant		
General Commercial	3,000 gpm for 3 hours with 20 psi residual pressure at fire hydrant		
Office Commercial	3,000 gpm for 3 hours with 20 psi residual pressure at fire hydrant		
Hospitality	4,000 gpm for 4 hours with 20 psi residual pressure at fire hydrant		
Employment			
Business Park	3,000 gpm for 3 hours with 20 psi residual pressure at fire hydrant		
Industrial	4,000 gpm for 4 hours with 20 psi residual pressure at fire hydrant		
Other			
Airport	4,000 gpm for 4 hours with 20 psi residual pressure at fire hydrant		
Mixed Use	3,500 gpm for 4 hours with 20 psi residual pressure at fire hydrant		
Open Space	1,500 gpm for 2 hours with 20 psi residual pressure at fire hydrant		
Public Facility	3,000 gpm for 3 hours with 20 psi residual pressure at fire hydrant		
Public School	2,500 gpm for 3 hours with 20 psi residual pressure at fire hydrant		

7-2 Service and Operational Criteria

7-2.1 Source of Supply

Any water system must be capable of meeting all demands imposed upon the system. This can be achieved through multiple supply sources, storage, or a combination of both. Generally, the determination is based upon water availability, existing storage capacity, and economics. It is prudent to secure water supplies from multiple sources so that demands can be met at reasonable levels when one or more water sources are not available.

California Code of Regulations Related to Drinking Water require a minimum source of supply to meet the service area's maximum day demand. Also since the City serves more than 1,000 meters, the system must be capable of providing four hours of peak hourly demand through a combination of source capacity, storage capacity, and emergency source capacity. Under this criterion, reservoirs are typically needed to regulate hourly fluctuations in demand, provide fire flow and supplement supply during an outage of a source for an extended duration.

As much of the average day demand shall be supplied by local sources as feasible.

7-2.2 Storage

Typically for a water system, three categories of storage are of importance: operational, emergency, and fire suppression. The entire system as well as each individual pressure zone is evaluated to determine the system's ability to meet storage criteria.

The required storage requirements for each pressure zone are anticipated to be met with reservoir capacity and well water. For pressure zones with multiple reservoirs, there is the potential that the high water elevations will differ between the two reservoirs. There may be unusable space, which will be accounted for in the storage analysis.

Operational Storage

Operational storage serves to equalize variations in sources of supply and demand over short periods of time (daily or weekly). Utilizing the daily demand hydrograph, the component of operational storage needs to account for the difference in supply and demand, which can be determined with an extended period simulation of the system over a day or a week, etc.

The operational storage might typically be based on one maximum day demand if groundwater storage is not available. For the City of Ontario's system, operational storage criterion is based on 30 percent of the maximum day demand for Ontario Ranch (OR) and 25 percent of the maximum day demand for the Original Model Colony (OMC). Greater daily demand fluctuations are anticipated in OR due to its residential character compared to the mixed residential and industrial character of OMC.

Emergency Storage

Emergency storage is used in the event of an interruption in the primary water supply source. It is assumed that most outages can be mitigated within 7 days. Accordingly, many agencies that depend solely on imported water utilize 7 average days of storage as their emergency storage criterion. It is reasonable to expect that groundwater sources will be available during an outage of the imported water supply. Therefore, the required emergency storage volumes may typically be reduced by an agency's groundwater supply capacity. The City of Ontario's emergency storage volume can be reduced by the actual production capacity of its wells. The only requirement would be that the facilities be capable of pumping the water needed during an emergency from the wells to the higher zones. Since the City's well capacity of 38,604 gpm exceeds the existing average day demand (20,600 gpm), the emergency storage criteria is set to one average day demand.

Operational and fire storage shall be available for each individual zone while emergency storage shall be available system-wide. Again, the only the requirement be that the facilities are capable of moving the water needed during an emergency, from the location of the storage to all other zones.

Fire Suppression Storage

Fire suppression storage, shown in Table 7-1, is the volume required to supply the service area with the required fire flows, which range from 1,500 to 4,000 gpm for a duration of two (2) to four (4) hours.

7-2.3 Booster Pump Stations

Booster pump stations are typically sized to deliver the maximum day demand plus fire flow or the peak hour demand of the service areas, whichever is greater. The exception is closed service zones supplied by either a hydropneumatic pumping system or a variable speed pumping system. Under these circumstances, the booster pumps must meet maximum day demand plus fire flow requirements or there must be a separate fire pump installed to meet the fire flow requirements.

All booster pump stations shall incorporate a standby pump of the same size as the largest duty pump. This ensures that there is a replacement for the largest duty pump during maximum day demand conditions, while one of the pumps at the station is being repaired or replaced. It typically takes pump manufacturers 12 to 16 weeks for delivery of a new pump and motor unit once the order is placed and shop drawings are approved.

7-2.4 System Pressures

Most water utilities set 60 to 80 pounds per square inch (psi) as the average static pressure throughout the system. The water system shall also be capable of maintaining a minimum residual pressure of 40 psi during the peak hour demand. A residual pressure of 20 psi must be maintained at the fire hydrant outlet in developed areas during fire flow.

In areas where pressures exceed 80 psi, the Uniform Plumbing Code requires customers to install “an approved type pressure regulator preceded by an adequate strainer” on their service connections to protect domestic plumbing and water heaters.

7-2.5 Transmission and Distribution Pipelines

The distribution system shall be sized and designed to provide redundant service at adequate pressures for normal use as well as at fire flow conditions. In most cases, this can be accomplished by looping the system. Looping through easements or other areas which are not easily accessible shall be avoided. Provisions shall be made for supplying each service zone from at least two sources where feasible.

In order to maintain adequate system pressures and prolong the life of the pipe, flow velocities shall be limited. The system shall operate at velocities of 1 to 3 feet per second (fps) normally, with a maximum velocity of 7 fps at intermittent peak flows for all pipes other than VCP pipes. Velocity in PVC pipes shall not exceed 5 fps. The pipe velocity at fire flows shall not exceed 10 fps for all pipes.

The pressure in the system at any given point for a particular flow is dependent on a number of variables including pipe size, roughness and length. These components all contribute to the magnitude of pressure losses in the system. The system shall be designed and operated to maintain system losses to less than 10 feet for each 1000 feet of pipe length under any condition, subject to satisfying all other criteria.

All pipes shall be sized to provide adequate fire flows. To achieve this, when a single, unlooped pipe provides fire service to an area, a minimum diameter of 8-inch shall be maintained to the last hydrant. All mains shall be constructed with a minimum diameter of 8-inches. In commercial and industrial areas, the minimum diameter required is 12-inches. These pipe size recommendations shall be adhered to for all new design and construction projects, as well as any waterline replacement/upgrade projects.

7-2.6 Fire Suppression

The fire flow requirements used for this study are based upon the 2016 California Fire Code, which is adopted by the City’s municipal code (Section 4-4.01).

Fire flows shown in Table 7-1 are required to be delivered at a minimum residual pressure of 20 psi at the fire hydrant outlet. The requirements in the California Fire Code are specific to each building on a given parcel of land and based on several factors, including land use, building construction methods and materials, and whether or not automatic sprinklers are present. These specific requirements are shown in Appendix 7-1.

As this Potable Water Master Plan is a planning level document, an evaluation of whether California Fire Code requirements are met at each parcel was not performed. Instead, selected typical requirements as a function of land use are used to establish minimum fire flow availability at each system hydrant. The minimum required fire flow was generally established based on the adjacent land use having the highest fire flow requirement. Table 7-1 is a summary of the selected fire flow criteria for the various land uses within the City. These requirements were established as performance evaluation criteria and used in developing system improvement recommendations.

For specific future development planning and design, the criteria should be adjusted on a case by case basis per the latest California Fire Code.

The 2016 California Fire Code requires the 20 psi minimum residual pressures at the fire hydrant outlet. Per the requirements of the City's fire department, the potable water system must be capable of maintaining this pressure, while providing the full fire flow requirement through a single fire hydrant. System pressures are estimated using the City's potable water hydraulic model, which has been updated and calibrated as part of this master plan effort.

7-2.7 Service Life of Facilities

All facilities have useful lives for which relatively trouble-free service can be expected. Once exceeded, these facilities become less reliable, expensive to maintain and are subject to failure. Therefore, facility age is considered in the assessment of all water systems and in formulating future replacement projects.

The determination of the useful life is dependent upon multiple considerations. Table 7-2 shows the useful lives that are generally accepted as prudent planning criteria. They shall be one of the considerations in determining the phasing of facility replacement.

7-2.8 Operational Flexibility

Operational Flexibility is achieved by providing multiple sources of supply, back-up or stand-by facilities, and looped distribution system piping. Criteria to be applied include:

- Provide multiple sources of supply
- Provide looped system whenever possible
- For wells, provide standby generators and automatic transfer switches to deliver at least the average day demand into the system. For other wells, provide portable generator connection and manual transfer switches.
- Provide standby generators and automatic transfer switches at all booster pump stations
- Provide emergency interconnections with neighboring agencies

7-2.9 Distribution System Maintenance Program

Regular maintenance of a distribution system is an essential part of a properly operated water distribution system. Maintenance shall include periodic flushing and cleaning of the system, servicing of valves and hydrants, conducting leak surveys, replacement and repairs, and disinfection of repaired sections. Each maintenance and repair activity shall be documented. This work shall be performed in accordance with the Title 22, Chapter 16 (California Waterworks Standards) and AWWA G200 Standards.

<u>Flushing and Cleaning</u>

Flushing shall be performed to remove any accumulated sediments or other impurities which have been deposited in the system pipes. It will also help to restore system capacity. It is important that system flushing be performed systematically to remove the debris. The minimum flushing velocity shall be 2.5 fps.

Table 7-2
Planning Criteria for Facility Useful Life

Facility	Useful Life (Years)
Steel Reservoirs	40
Concrete Reservoirs	50
Lined and Coated Ductile Iron/Steel Pipe	50
PVC Pipe	50
Asbestos Cement Pipe	50
Cast Iron and Steel Pipe (Lining or coating of non-current practice)	35
Pump Stations/Wells/Treatment Facilities	
Structure	50
Piping	40
Valves	20
Mechanical	15
Electrical	15
Well Casing	20 - 60

Cleaning, will require proper access to the pipelines, shall be conducted on the sections that require it based upon the information collected and documented during regular maintenance activities.

Servicing of Valves and Hydrants

Valves are often found inaccessible, inoperable, or closed and shall therefore be tested and exercised regularly. In the event of a line break, it is important that valves operate properly so that the break can be isolated for repair. Records of repair shall require a notation of the time at which valves are closed and reopened so that valves do not remain closed inadvertently. The City's valves are scheduled to be exercised every five years.

Hydrants shall be periodically inspected for leaks at the hose outlets. Leaking hydrants shall be removed and/or reconditioned and then replaced. Valve exercising and hydrant maintenance programs can be implemented in conjunction with the flushing program.

Leak Surveys

Comparison of pumping and purchase records, and customer meter readings and other uses such as system flushing can indicate if excessive leakage is occurring in the system. Leak surveys shall be conducted when excessive leakage is suspected.

Water Main Replacement and Repair

Water mains shall be repaired and/or replaced when pipes are found to be broken, corroded, or leaking. The method of repair shall consider if the line is scheduled for replacement, its location in the system, and the conditions which led to the failure. Following the repair or replacement of any pipe, the line shall be flushed and disinfected in accordance with the applicable requirements.

7-2.10 Storage Tank and Reservoir Maintenance

The storage tanks shall be inspected periodically by a qualified diver at no more than 5 year intervals. The reports from diving inspections shall be utilized in scheduling the subsequent inspection program, as well as the maintenance/repair projects.

7-3 Design Criteria

7-3.1 Wells

The wells shall be designed in accordance with the Water Well Standards: State of California Bulletin 74-81 and Bulletin 74-90 (supplement to Bulletin 74-81), the most recent AWWA Standard A-100, Department of Public Health requirements, and sound engineering judgment.

The pumps shall be placed low enough in the casing so that subsequent lowering shall not be necessary. All well screens shall be below the pump intake to preclude cascading of water into the well casing even with the lowest expected pumping water level. The casing diameter shall be at least 4 inches larger than the largest pump/column pipe dimension, and maximum velocity shall not exceed 5 fps. Total screen area shall be sized to maintain a velocity of less than 0.1 foot per second at the maximum anticipated flow. Additionally, the casings diameters shall be selected to allow lining the wells in the future without losing significant capacity. The use of higher grade materials, such as stainless steel shall be considered to increase the useful life of the wells.

The well design shall include a 4-inch diameter camera tube extending to below the pump intake elevation, and a sounding tube. A separate air line with a depth gauge and an air connection shall be provided at every well. Flow meters, pressure gauges, and telemetry equipment shall be included to continuously monitor the wells. Either permanent emergency generators with automatic transfer switches or portable generator connections with manual transfer switches shall be provided at each well site. Sufficient standby power generation capacity shall be provided to pump at least the average day demand into the system.

7-3.2 Booster Pump Station

The pump stations shall be equipped with modern pump controllers, flow meters, suction and discharge pressure gauges, proper isolation valves, and telemetry equipment. Facilities that will minimize pressure transients at start-up, shut-down, and power failure shall be provided. Flow meters and pressure gauges are essential tools for monitoring pump performance and demand conditions in the service area. Telemetry equipment is used to remotely monitor the status of the facility, and notify personnel in the event of a failure.

Pump stations shall be constructed of fireproof materials and be provided with peripheral sprinkler systems to prevent fire damage. Furthermore, power to the pump stations shall be provided through underground service to minimize possibility of damage during fires.

Standby generators and automatic transfer switches shall be provided to operate the pump stations during commercial power outages.

7-3.3 Pressure Reducing Stations

Pressure reducing stations supplying service zones shall be constructed with sufficient valves to deliver the entire range of demands and the fire flows within their proper operating range. Wherever possible, a minimum of two pressure reducing stations shall serve these zones. Pressure reducing stations shall be constructed with a pressure relief valve at the downstream end to preclude excessive pressures in the service area in case of malfunctioning of the pressure regulating valves. Each pressure reducing station shall be equipped with flow meters and telemetry equipment so that their operation can be remotely monitored through the SCADA system, and alarm conditions, such as open pressure relief valve can be addressed in a timely manner.

SECTION 8

HYDRAULIC MODEL

8-1 General

A computer model of the City's water system was developed in the Innovyze Infowater software platform. It was utilized to aid in the evaluation of the adequacy of the existing facilities under the current and future supply and demand conditions.

Generally, the model development steps included the following:

1. Import water system GIS data to modeling software
2. Verify and complete pipe information (pressure zone, diameter, length, roughness)
3. Verify and complete junction information (pressure zone, elevations)
4. Add detailed facility data (wells, pump station, reservoir, imported water turnouts, and pressure reducing stations)
5. Add facility information (dimensions and water level for tank, pump curves for pumps, sizes and pressure settings for pressure reducing valves, and aquifer levels for well pump suction levels)
6. Determine and assign demands to model junctions
7. Develop and assign diurnal demand curves to model junctions
8. Assign controls to facilities (pump start and stop conditions)

The City's Water GIS and atlas sheets were used as the basis of the geometry of the potable water model. Water system facilities (reservoir, pump station, wells, pressure reducing stations, and turnouts) were added to the model based on as-built construction plans and provided facility information, such as pump curves, efficiency tests, ground water levels, and operational controls. The City consistently updates its Water GIS as new developments are constructed and as improvement projects are completed. The potable water model was generated from the City's water geodatabase from March 2019.

The model includes the potable water pipelines that are owned by the City. Water service laterals are not included. Fire hydrant laterals are included. Modeling information associated with each pipe includes diameter, length, and roughness factor. Other pipe information included in the model database are year of installation, pressure zone, and pipe material. Modeling information associated with each junction includes ground elevation, water demand, and diurnal pattern of demand. Model junction elevations were obtained from the City's latest 5-foot contour data (GIS Shapefile).

8-2 Demand Distribution

Existing Demands

Customer water meter data was geocoded/linked to the City's GIS meter shapefile by Service Profile Identification (SPID) number. Next, service laterals were used to spatially join the the meters to the mainline junctions within the associated pressure zone. This enabled each water meter and its demand to be assigned to the closest model junction ID.

The existing average day demand (ADD) distribution was based upon water meter data provided for the period between September 2018 and August 2019. The existing maximum day demand (MDD) distribution was based upon peaking factors described in Section 4-5. In the OMC service area the MDD to ADD peaking factor is 1.6, while in the OR service area the peaking factor is 1.5.

After the ADD were loaded onto model junctions, they were adjusted so that the total demand matched the existing water production estimates (see Table 4-3). MDD were developed using the peaking factors. The method of distributing demands inherently accounted for any high water users within the existing service area as well as non-revenue water.

The water demands are assigned to the following database fields within the model:

- Demand Type 1: Existing residential demand
- Demand Type 2: Existing non-residential demand
- Demand Type 3: Existing high water user Demand
- Demand Type 4: Future residential demand
- Demand Type 5: Future non-residential demand

Future Demands

The increase in future water demand is due to the development of Ontario Ranch, anticipated densification in land use and population per the City's 2010 General Plan, and the assumption that the area within the service area will be fully occupied (vacant land will be built upon and occupied).

The existing loads remained the same unless an area was going to be redeveloped. Future demands were estimated using the water demand factors summarized in Table 4-7.

8-3 Diurnal Patterns

The developed diurnal demand patterns discussed in Section 5 were specified at each node.

8-4 Model Scenarios

The accuracy of the hydraulic model for the existing system was verified during the calibration process, as described in Section 10 of this report. Within the model software, new data sets and query sets were created to represent different operating conditions. The following five scenarios were created.

- Calibration Day Scenario (CALIBRATION_2019_04_18)
- Existing Average Day Demand Scenario (EXISTING_ADD)
- Existing Maximum Day Demand Scenario (EXISTING_MDD)
- Future Average Day Demand Scenario (FUTURE_ADD)
- Future Maximum Day Demand Scenario (FUTURE_MDD)

Data sets change as conditions in each scenario need to be changed. For example, separate demand sets were created to represent the various demand conditions. Separate control sets were created to define the initial status and controls of facilities (pumps and valves). The data sets associated with each scenario are shown in Table 8-1.

Table 8-1

Existing Data Sets

Data Set	Calibration Day Scenario (CALIBRATION_2019_04_18)	Existing Scenarios		Future Scenarios	
		Average Day Demand Scenario (EXISTING_ADD)	Maximum Day Demand Scenario (EXISTING_MDD)	Average Day Demand Scenario (FUTURE_ADD)	Maximum Day Demand Scenario (FUTURE_MDD)
Demand Set	CALIBRATION_2019_04_18	EXISTING_ADD	EXISTING_MDD	FUTURE_ADD	FUTURE_MDD
Tank Set	CALIBRATION_2019_04_18	EXISTING_ADD	EXISTING_MDD	FUTURE_ADD	FUTURE_ADD
Reservoir Set	EXISTING	EXISTING	EXISTING	EXISTING	EXISTING
Pump Set	EXISTING	EXISTING	EXISTING	EXISTING	EXISTING
Pipe Set	EXISTING	EXISTING	EXISTING	FUTURE	FUTURE
Valve Set	CALIBRATION_2019_04_18	EXISTING_ADD	EXISTING_MDD	FUTURE_ADD	FUTURE_MDD
Control Set	CALIBRATION_2019_04_18	EXISTING_ADD	EXISTING_MDD	FUTURE_ADD	FUTURE_MDD
Logical Set	BASE	EXISTING_ADD	EXISTING_MDD	FUTURE_ADD	FUTURE_MDD

8-5 System Operations

The hydraulic model was used to analyze the existing and future systems under average day demands (ADD) and maximum day demands (MDD).

For a potable water system as large as the City's, there are numerous ways that the system can be operated. There are multiple sources of water to each major zone. The day-to-day operations of the system take into consideration, but are not limited to the following issues: water quality, well production goals, imported water goals, and energy costs.

The operational settings and facility statuses for the ADD and MDD scenarios were developed per meetings with the City's Operations staff, review of SCADA data, historic water use and operations data.

It is important to note that the controls in the developed model are largely based on SCADA information. Controls will need to be reevaluated and updated for additional scenarios created and analyses conducted by the City in the future.

Some of the well and pump station facilities are enrolled in a time of use (TOU) rate through Southern California Edison. TOU rates are broken down into the following 4 categories: Super Off Peak, Off Peak, Mid Peak, and Peak. TOU rates vary the time of day energy is used, as well as between weekdays and weekends. TOU rates also vary seasonally with increased rates, during the warm summer months (June 1st to September 31st).

8-6 Wells

The City's water system currently has seventeen (17) active wells. Table 8-2 and Table 8-3 describe the existing and future operation control settings of the wells, respectively. The summary tables detail operations for the ADD and MDD scenarios.

Groundwater levels at the wells were represented in the model by constant level, unlimited capacity reservoirs. The groundwater levels for wells were based on the most-recent groundwater level readings.

8-7 Imported Water Connections

Imported water connections were simulated using flow control valves with the settings included in Table 8-4.

Table 8-2

8-8 Reservoirs

All active reservoirs are included in the hydraulic model. The reservoirs are designated as “tanks” because they have a known finite volume and water surface levels that change with time as water flows into or out of them. (Note the model software defines “reservoirs” as sources of water that remain at a constant water level irrespective of the flow. They have an unlimited volume and are generally used to represent a lake or other inexhaustible supply source.)

The initial reservoir levels for the ADD and MDD scenarios for the existing and future models are summarized in Tables 8-5 and 8-6, respectively.

8-9 Booster Pumps

Tables 8-7 and 8-8 describes the existing and future operation control settings of the booster pumps, respectively. The ADD and MDD operational settings were determined after meeting with the City’s Operations staff and review of existing SCADA data.

8-10 Pressure Reducing Stations

The pressure reducing stations (PRS) are needed to increase pressure during peak hour demands, as well as to provide additional flow during an emergency fire flow event. The PRS controls settings were provided by the City's Operations staff and are summarized in Table 8-8.

The Innovyze InfoWater hydraulic model software has known difficulties modeling valves in parallel. Upon speaking with Innovyze technical support, it was recommended that one valve be modeled at each location representing a pressure reducing station. Therefore, the larger valve at each pressure reducing station was modeled with the highest pressure setting of that station.

Table 8-8

Pressure Reducing Stations Summary Table

PRS ID	Model Valve ID	Status	US Zone	DS Zone	Model Elevation (ft)	Model Pressure Reducing Setting (psi)

8-11 Altitude Valves

For master planning purposes, altitude valves refer to valves with flow control capabilities. These valves are set to open when downstream reservoir levels lower passed the flow control operational set point, which will allow water to pass the upstream zones to downstream zones.

The altitude valve operational settings were provided by the City's Operations staff and are summarized in Table 8-8.

Table 8-9

Altitude Valve Operational Settings Summary

8-12 Pipes

The friction factors established in the 2012 Water Master Plan was utilized in the hydraulic model for this study as well. The friction factors used are shown in Table 8-10.

Table 8-10

C-factors used in the Model

Diameter	AC Pipes	PVC Pipes	Mortar Lined Pipes	Steel/ Cast Iron Pipes (before 1950)	Steel/ Cast Iron Pipes (after 1950)
<= 4-inch	125	135	110	80	110
6-inch	125	135	110	80	110
8-10 inch	125	135	110	80	110
12-16 inch	130	140	115	90	115
16-20 inch	130	140	115	90	115
20-24 inch	130	140	115	90	115
24-30 inch	140	150	120	100	120
30-36 inch	140	150	120	100	120

SECTION 9

MODEL CALIBRATION

9-1 General

The general calibration methodology was to gather as much system information as possible from either available SCADA information and pressure measuring equipment temporarily installed in the field. This information was then used for input into the model as well as for comparison of model results. The calibration process was used to verify the accuracy of the model, system configuration, and the hydraulic parameters utilized. Typical indicators of an accurate model include the following:

- Pressure differences of 5 percent or less
- Pressure reducing station flow differences of 5 percent or less (if flow information is available)
- Booster pump station flow differences of 5 percent or less
- Well flow differences of 5 percent or less
- Reservoir level differences of about 1 foot or less

9-2 SCADA Data Collection

SCADA data was collected from April 8, 2019 to April 22, 2019 and used in calibrating the 24-hour extended period simulation. The data was recorded in 5-minute intervals. Based on the data gathered, a time period was selected where the information gathered indicated flow and pressures without noticeable anomalies and/or significant variation. The selected calibration day was Thursday, April 18, 2019.

<u>Supervisory Control and Data Acquisition (SCADA) Data</u>

SCADA data collected generally included the following:

a. Reservoirs - level

b. Booster Pump Stations - flow at pump station, suction pressure, discharge pressure

c. Wells - flow, discharge pressure

d. Turnouts - flow

e. Flow Control Facilities - flow, upstream pressure, downstream pressure

9-3 Calibration Scenario

The existing water system model was calibrated to verify the accuracy of the model, system configuration, and the hydraulic parameters utilized.

<u>Demands</u>

Demand allocation for the calibration scenario was based on the distribution represented by the water billing data during the period April 2018 to May 2018. The model demands were then, globally adjusted to match the total average daily supply for each hydraulic pressure zone, during the calibration period.

The high-water user demands were excluded from the global adjustment because those demands and diurnal patterns were individually assigned to the appropriate model nodes. Then the diurnal patterns were assigned to the remaining demands, based on hydraulic pressure zone and meter type (residential and non-residential).

The total demand during the calibration period was 20,574 gpm, which was the daily production and purchase total for the selected calibration day (April 18, 2019).

<u>Reservoirs</u>

Initial reservoir levels were set to match those of calibration day (April 18, 2019 at 12 am), as shown in Table 9-1. Reservoirs 1074-1A and 1074-1B are located close to each other at Cucamonga Avenue and Fourth Street. The hydraulic model has difficulty modeling multiple reservoirs that are in close proximity to each other. The reservoir levels sporadically increase and decrease between each time step as the model tries to move water between the storage facilities that are in close proximity to each other. For this reason, the 1074 Zone reservoirs are modeled as one equivalent sized tank. Likewise, Reservoirs 1348-1A, 1348-1B, and 1348-1C are modeled as one equivalent sized tank.

The City's operations staff identified that some of the reservoir level sensors are inaccurate. Per the City's operational staff recommendations, the SCADA level data information was adjusted as follows:

1. Reservoir 1010-2A level data was disregarded and instead assumed to be similar to that of Reservoir 1010-2B.
2. Reservoir 1074-1A and Reservoir 1074-1B level data was increased by 5 feet.
3. Reservoir 1212-1B level data was reduced by 14 feet.

Turnouts

The turnouts were modeled by utilizing a flow control valve and a flow pattern to simulate the volume of water entering the system on the calibration day per SCADA information. A summary of the turnout flows is detailed in Table 9-2.

Wells

The wells were operated by time controls per the calibration day SCADA information, as detailed in Table 9-3. The groundwater elevation at each well was calculated by subtracting the static ground water depth and the drawdown depth from the ground surface elevation. The static ground water levels were recorded at the time of the calibration effort. The drawdown levels were determined from the most recent efficiency tests.

Altitude Valves

The altitude valves were modeled utilizing a flow control valve and a flow pattern to simulate the volume of water through the facility on calibration day per SCADA information. A summary of the altitude valves for the calibration day are shown in Table 9-4.

Pump Stations

The booster pumps were operated by time controls per the calibration day SCADA information, as detailed in Table 9-5.

Pressure Reducing Stations

As discussed in Section 6, the larger pressure reducing valve at each station feeding a reduced zone was modeled with the highest pressure setting of that station. A summary of the pressure reducing stations for the calibration day are shown in Table 9-6.

9-4 Reservoir Level Comparison

Upon running the calibration scenario, the first comparisons made were the levels at all reservoirs. Initially, not all reservoir levels matched well. Adjustments/corrections to the model were made to resolve these situations. Actions taken to adjust/correct the model included the following:

a. Verified system geometry, including pipe connections, pipe sizes, and closed valve locations. We identified locations where the existing GIS did not accurately reflect the pipe connections and pipe sizes. The model was adjusted to include changes in pipe sizes per City's GIS information and verification. AKM and City staff utilized atlas sheets, as-built plans, and field investigation to determine if system geometry was incorrect and how to fix it in the hydraulic model.

b. Verified the facility information, including reservoir dimensions, pump curves, elevations, and valve settings.

c. Verified allocation of zone demand

d. Verified reservoir level controls

In general, the reservoir levels recorded in the field matched the reservoir levels that were calculated by the hydraulic model. Factors that may have contributed to the difference in levels include, but are not limited to; closed or partially closed isolation valves; inaccurate PRV settings; differences in billing data and the calibration day demands. The comparison of reservoir levels for the calibration scenario is graphically shown on Figures 9-1 through 9-9. A discussion of any discrepancies between the model and the field data is discussed following the associated reservoir level comparison figure.

Figure 9-1

Reservoir 925-2A Level Comparison

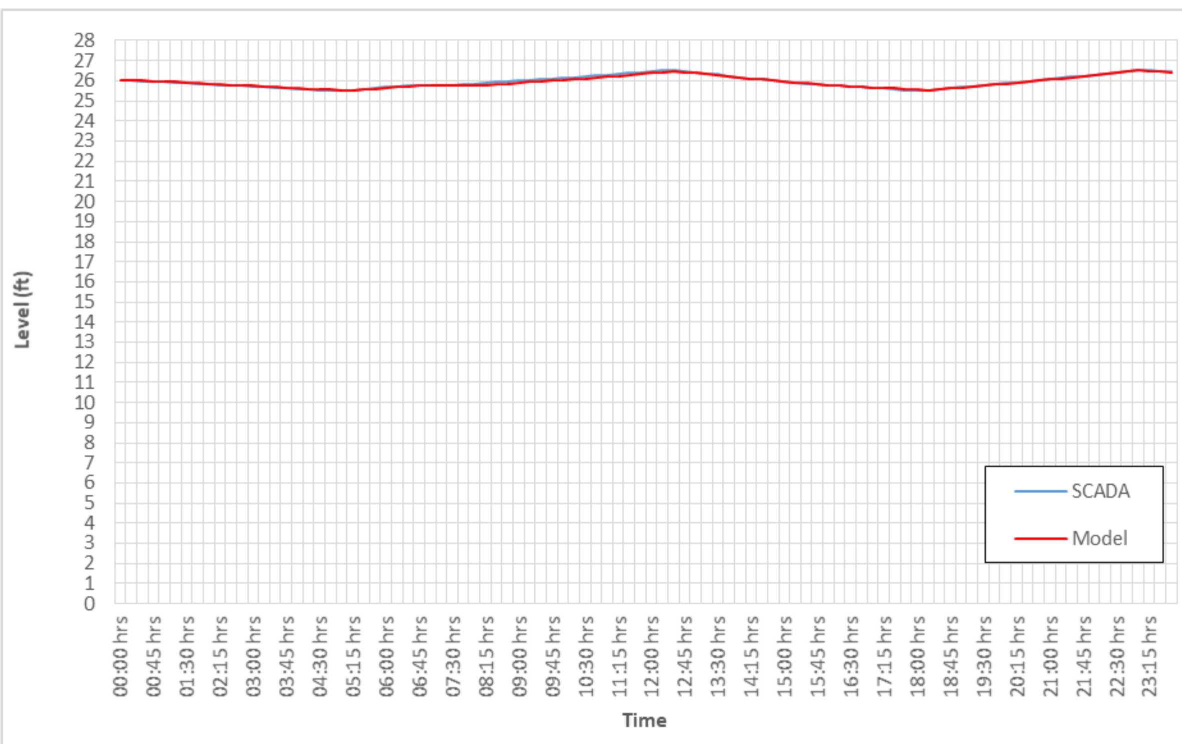

Figure 9-2

Reservoir 1010-1 Level Comparison

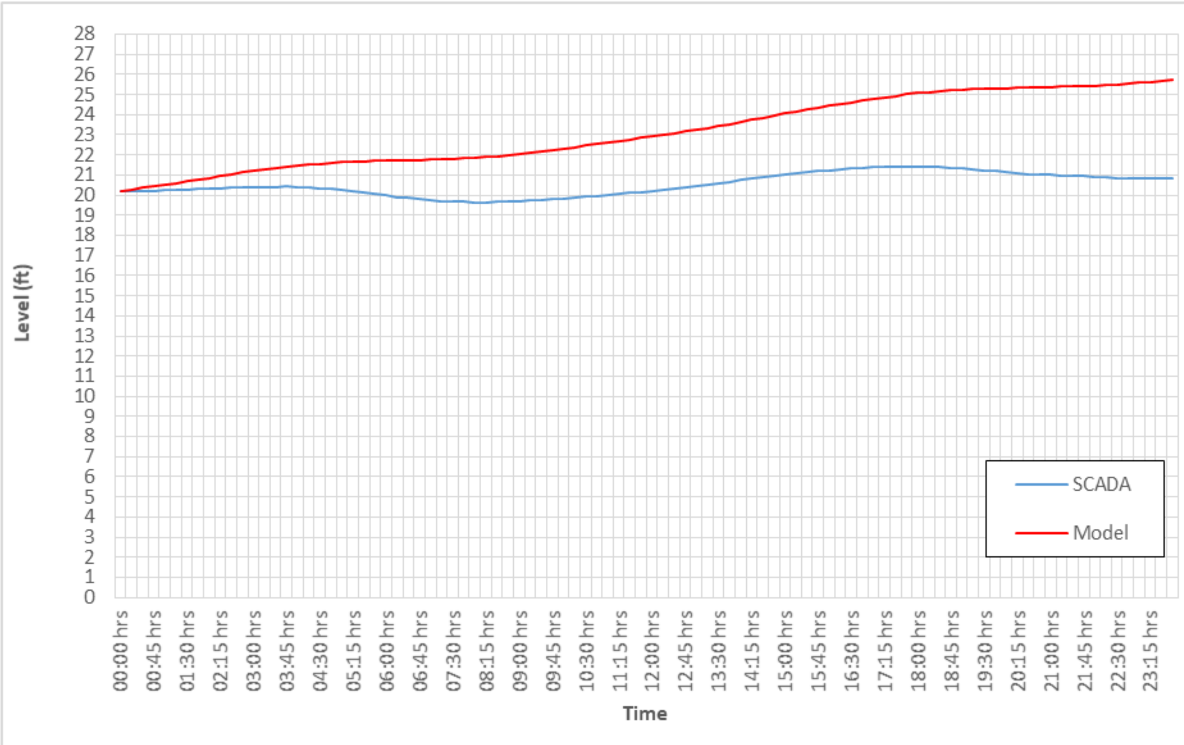

Figure 9-3

Reservoir 1010-2A Level Comparison

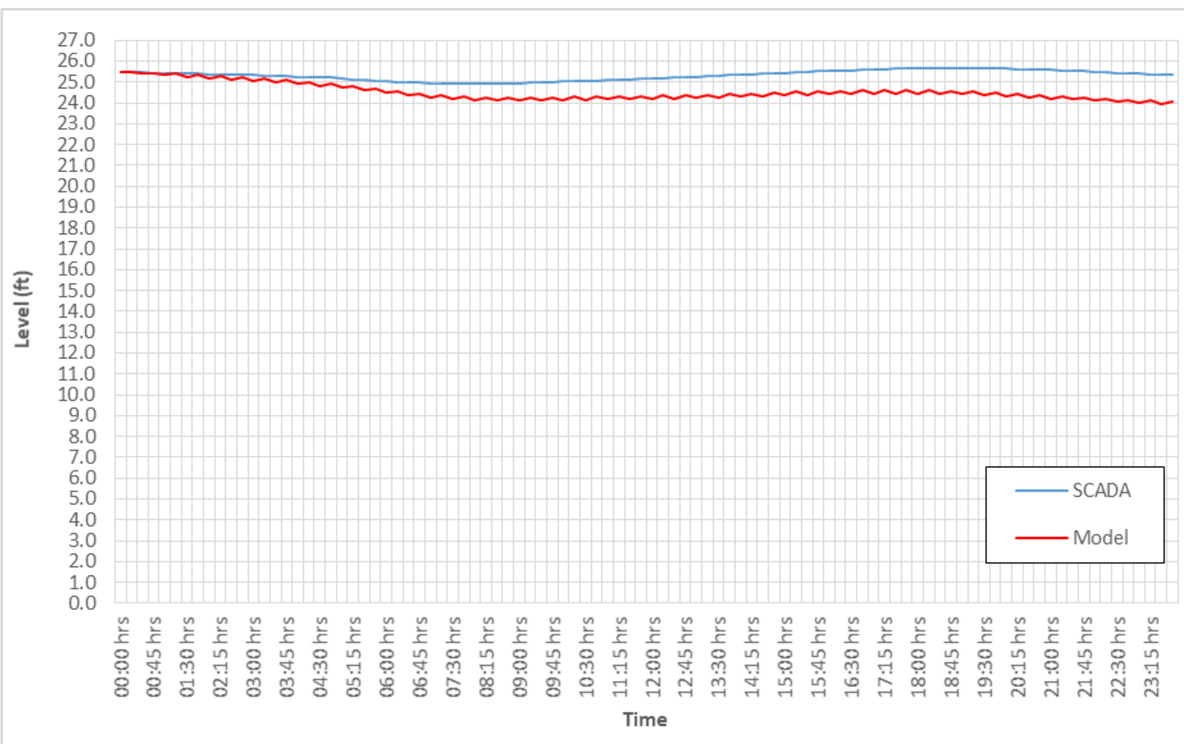

Figure 9-4

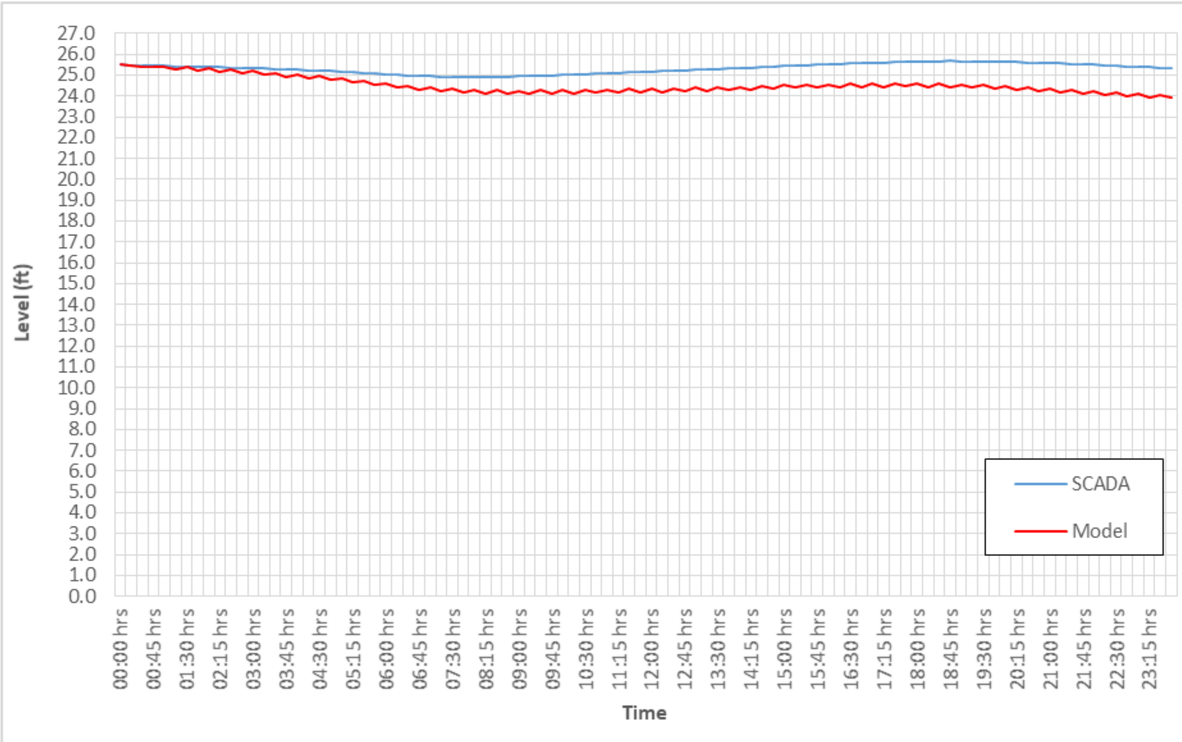
Reservoir 1010-2B Level Comparison



Reservoir levels from SCADA data did not match the model estimated levels in the 1010 Zone. The Reservoir 1010-1A is located on the west side of the service area, and the Reservoirs 1010-2A and 1010-2B are located at the same site on the east side of the service area. The City's operations staff stated that the east and the west side of the 1010 Zone are generally operated as two separate systems because the reservoir sites are located so far apart and connected by two pipelines that are not able to convey water back and forth efficiently between the two sides of the zone.

During the calibration period, Reservoir 1010-1A was supplied water via the AV-1010B altitude valve, while the Reservoir 1010-2A and 1010-2B were supplied water via the CDA II Lateral D. It is believed that there may be some closed and/or partially closed valves that are restricting flow between the 1010 Zone reservoirs on the east and the west side of the service area. It is recommended that the City verify that all valves in the 1010 Zone are fully opened and not restricting flow. For the purpose of this hydraulic analysis, the model valves in the 1010 Zone are fully open.

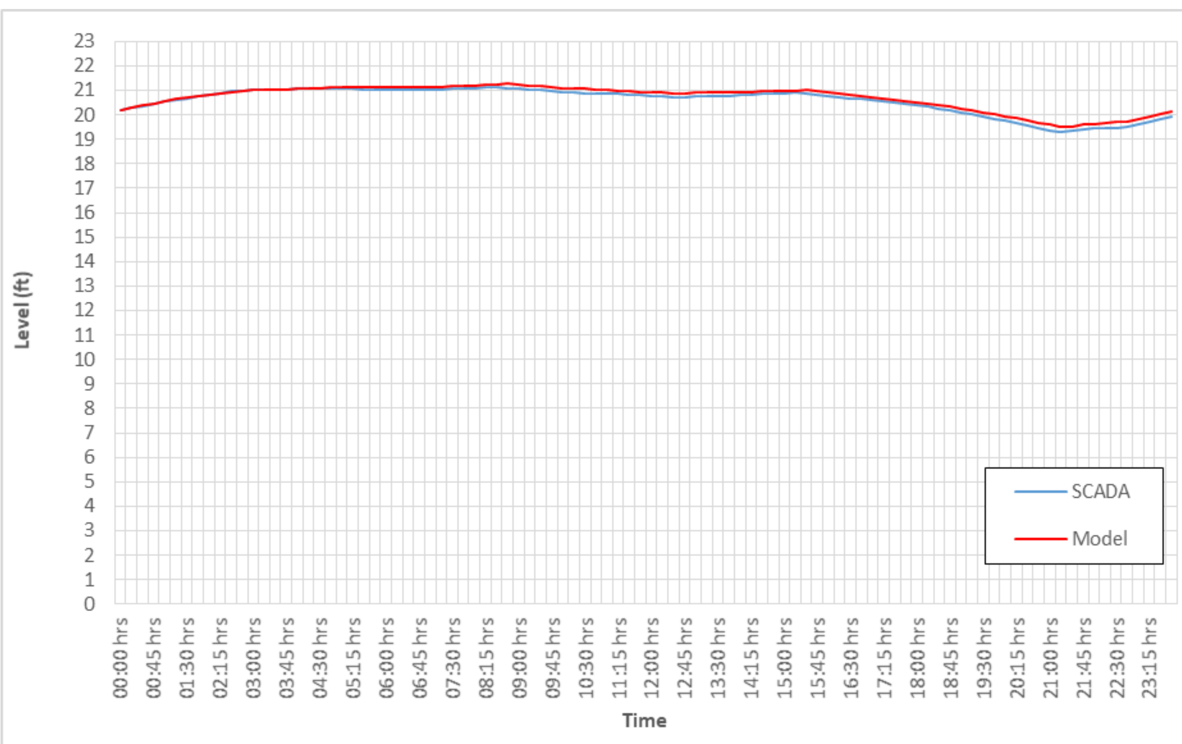

Figure 9-9

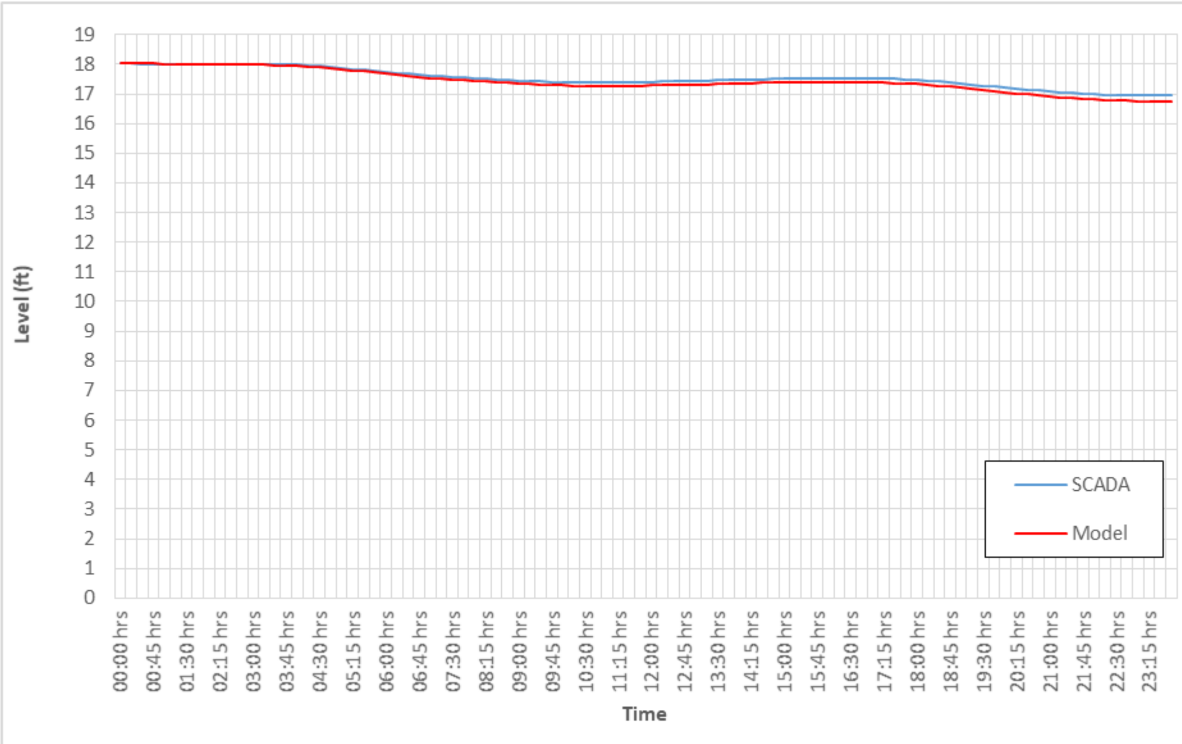
Reservoirs 1348-1A, 1B, and 1C Equivalent Tank Level Comparison



9-5 Pressure Data Comparison

In addition to the pressure data available on the SCADA system, pressure data was collected by installing portable pressure data loggers on twenty-eight (28) fire hydrants throughout the system. The locations selected were primarily in the large open zones of the system, scattered throughout in order to obtain representative pressure measurements in all areas of the system. The locations were specifically placed away from main facilities such as reservoirs, pump stations, and turnouts where pressures are not expected to vary as much and/or where pressure information is already available in the existing SCADA system. The pressure data logger locations are listed in Table 9-7 and shown on Figure 9-10.

The model calculated pressures at Cedar and Business (logger location ID 20 or model node O19FIT173) do not match the field recorded pressures on calibration day. The model calculated pressures that are about 8 psi less than the pressures recorded in the field. It is likely that the pressure difference is due to a discrepancies with actual hydrant elevation or with the pressure data logger equipment.

Table 9-7

SECTION 10

EXISTING SYSTEM ANALYSIS

10-1 Introduction

The established system criteria and calibrated system computer model were utilized in analyzing the existing system, and evaluating its adequacy. As discussed in Section 9, the system model was calibrated by simulating actual system conditions and making adjustments to the model. The model was then utilized to analyze the existing system under average day, maximum day, and peak hour conditions.

Existing system deficiencies were identified and mitigation projects were formulated based upon the results of the model runs and input from City staff. Proposed projects were added in the hydraulic model to test the operation of the system after their implementation.

A capital improvement program was developed as a result of these analyses. Recommended projects and cost estimates are discussed in Section 13 of this Master Plan Report.

10-2 Existing Source of Supply

Any water system must be capable of meeting all demands imposed upon the system. The City's existing water demands are summarized in Table 10-1.

This can be achieved through multiple supply sources, storage, or a combination of both. It is prudent to secure water supplies from multiple sources so that demands can be met at reasonable levels when one or more water sources are not available.

Table 10-1
Existing System Demand

Demand Description	Total System Demand (gpm)	(mgd)	(AFY)
Average Day	19,280	27.76	31,098
Max Day	29,790	42.90	48,051
Peak Hour[1]	36,934	53.19	59,575

[1] *Estimated from Existing System Model*

10-2.1 Existing Average Day Demand

The criterion established requires a source of supply equal to one average day demand (ADD) (19,280 gpm) from local sources.

The City's existing source of supply is detailed in Table 10-2. The City's local water source include direct access to groundwater from the Chino Basin, which is managed by the Chino Basin Watermaster. The City's existing seventeen (17) active wells have a capacity of 38,604 gpm, which is about double the existing ADD.

Table 10-2
Existing Source of Supply

Source	Capacity gpm	mgd	AFY
Existing Wells	38,604	55.6	62,269
WFA	10,700	15.4	17,259
CDA	5,290	7.6	8,533
Total	**54,594**	**78.6**	**88,061**

10-2.2 Existing Maximum Day Demand

California Code of Regulations Related to Drinking Water requires a minimum source of supply of one maximum day demand (MDD) of the service area. Under this criterion, reservoirs are typically needed to regulate hourly fluctuations in demand, provide fire flow and supplement supply during an outage of a source for an extended duration.

As detailed in Table 10-2, the total existing source of supply is equivalent to 54,594 gpm. This is about 183% of the City's existing MDD (29,790 gpm). With 38,604 gpm from groundwater sources alone, the City is capable of providing the full MDD.

The available existing imported water from the Chino Desalter Authority (CDA) and Water Facility Authority (WFA) total 15,990 gpm (54% of the existing MDD). If some wells are out of service, the City would need 13,800 gpm (29,790 gpm – 15,990 gpm) from groundwater sources to supply the remaining MDD. This is about 36% of the existing system well capacity.

10-2.3 Existing Peak Hour Demand

California Code of Regulations Related to Drinking Water, Chapter 16, Section 64554 requires that if a system has more than 1,000 service connections, it must be capable of providing four (4) hours of peak hourly demand (PHD) through a combination of source capacity, storage capacity, and/or emergency source connections.

As detailed in Table 4-5, the City's existing peak hour demand is 36,934 gpm. The City's existing total supply is 54,594 gpm with 38,604 gpm from groundwater sources, which is capable of providing the peak hour demand for four (4) hours. Storage capacity is not necessary to meet the peak hour demand supply criteria.

10-3 Storage

10-3.1 Storage Criteria Summary

Operational Storage

For the City of Ontario's system, operational storage criterion is based on 30 percent of the maximum day demand for OR, and 25 percent of maximum day demand for OMC due to the diversity of demands in OMC.

Emergency Storage

The City's emergency storage criterion is set at one average day demand. For a system that depends mostly on groundwater supplies, this amount of emergency storage is adequate and is primarily for response in operations due to a loss of a major source of supply.

Fire Suppression Storage

Fire suppression storage is the volume required to supply the service area with the required fire flows, which range from 1,500 to 4,000 gpm for a duration of two (2) to four (4) hours.

The fire flow suppression storage and operational storage is increased by 15 percent so that a portion of the reservoir volume is available for variations in elevation, and to provide submergence over the reservoir outlet pipes. In an emergency, the emergency storage volume, as well as the operational storage volume and the fire suppression storage volume would all be available for use.

10-3.2 Existing Storage Analysis

Table 10-3 shows the existing storage capacity in each zone, and the reservoir capacity needed.

Table 10-3

Existing Storage Analysis

Zone	1348	1212	1074	1010	925	Total System
Average Day Demand (mgd)	2.96	12.88	5.53	5.98	0.41	27.76
Maximum Day Demand (mgd)	4.71	19.75	8.55	9.27	0.61	42.90
[1]Fire Flow Demand (gpm)	3,500	4,000	4,000	4,000	4,000	-
Fire Flow Duration (hrs)	4	4	4	4	4	-
[2]Fire Suppression Storage (MG)	0.84	0.96	0.96	0.96	0.96	-
[3]Operational Storage (MG)	1.18	4.94	2.14	2.32	0.18	10.75
[4]Emergency Storage (MG)	2.96	12.88	5.53	5.98	0.41	27.76
[5]Total Storage Required (MG)	5.29	19.67	9.09	9.75	1.72	45.51
[6]Existing Available Storage (MG)	8.75	32.00	4.75	23.50	6.00	75.00
Zone Surplus / Deficit (MG)	3.46	12.33	-4.34	13.75	4.28	29.49

[1] *Highest fire flow required in zone*

[2] *Fire flow multiplied by duration*

[3] *30% of maximum day demand for NMC, 25% of maximum day demand for OMC*

[4] *One average day demand*

[5] *(1.15 x (fire suppression+operational storage))+emergency*

A deficit of 4.34 MG is calculated in the 1074 Zone. The storage surplus in the 1212 Zone could be transferred to the 1074 Zone through altitude valve 1074A at the Reservoir 1074-1 site, as well as through PRS 6, 10, 11, 12 and 21 to make up for this deficit.

10-4 Existing System Hydraulic Model Analysis

The existing system model was calibrated to simulate actual field conditions, as detailed in Section 9. Once calibrated, the hydraulic model was run to analyze the existing system. The pressures during the ADD scenario were above the City's dynamic pressure criteria (40 psi) throughout the service area. The existing system was also evaluated under the MDD scenario, which include the peak hour demand, and all pressures met the City's criteria. The 24-hour average pressure contours for the existing system are illustrated on Figure 10-1.

The maximum velocity criteria of 7 ft/s or less under maximum day and peak hour demands is generally met throughout the City's existing system. The maximum velocities are detailed on Figure 10-2.

10-5 Existing Facility Condition Assessment

All facilities have useful lives for which relatively trouble-free service can be expected. Once exceeded, these facilities become less reliable, expensive to maintain and are subject to failure. Therefore, facility age is considered in the assessment of all water systems and in formulating future replacement projects.

Planning criteria included in Table 7-2 were used to identify facilities that have reached or are nearing the end of their useful lives.

10-5.1 Wells

Operations staff is limited in its operating capabilities due to water quality issues which include but are not limited to perchlorate, 1,2,3 Trichloropropane (TCP), and a bacterial plume. In addition, the City is preparing for new state and federal regulations for perfuorooctane sulfonate (PFOS) and polyfluoroalkyl (PFOA). The City is anticipating that all existing wells will require improvements to provide the necessary treatment capabilities for the various water quality issues with the groundwater source. Capital improvement projects are recommended for water quality treatment near Reservoir 925-2A, near future Reservoirs 925-1A and 925-1B, and for wells in the OMC.

The City plans to rehabilitate and reactivate Well 37, 39, and 50 in the 1010 Zone. It should be noted that Well 37 currently supplies the 1212 Zone, but will be reconfigured to supply the 1010 Zone, when the well is upgraded.

The wells sites are being rehabilitated to improve the existing roofs to ensure all mechanical equipment is protected. The roof improvement projects are expected to be completed in the 2021 Fiscal Year. The wells are also being equipped with chlorine generators, which will be completed by the 2024 Fiscal Year.

The estimated useful life of well casings is 60 years. The oldest active well is Well 24, which was constructed in 1969. Well 30 was constructed in 1978, and Wells 29 and 31 were constructed in 1979. Depending upon the condition of the casings, these wells may need to be replaced in the next 10 to 20 years. Before designing treatment upgrades at Well 24, 29, 30, and 31, it is recommended that the City evaluate the condition of the casing to determine if additional improvements or replacement is necessary.

The future system hydraulic model analysis, includes use of all existing wells and rehabilitated Wells 37, 39, and 50.

10-5.2 Reservoirs

A "Reservoir Seismic Vulnerability Evaluation" was conducted in 2008 by Tetra Tech, which was summarized by the City's Utilities Engineering Division in the "Seismic Risk of City's Potable Water Reservoirs" technical memorandum, dated 2012. The memorandum recommended seismic upgrades at Reservoir 1074-1A, 1074-1B, 1212-1A, 1212-3, 1348-1A, 1348-1B, and 1348-1C.

Per the established criteria for concrete reservoirs, six of the City's existing reservoirs have outlived their useful life of 50 years: Reservoirs 1074-1B (1957), 1212-1A (1959), 1212-1B (1958), 1212-3 (1926), 1348-1B (1955) and 1348-1C (1958). These reservoirs should be re-inspected and their condition should be assessed every three (3) years, at minimum, to determine the need for rehabilitation/replacement projects.

The future system hydraulic model analysis, includes use of all these reservoirs.

Figure 10-2

Reservoir 1212-3

Based on review of the 2012 technical memorandum, the tank inspection (completed September 10, 2010), and discussions with City staff, there are plans for the Reservoir 1212-3 be repaired, which will extend its useful life possibly by 10 to 15 years. A thorough inspection and condition assessment is recommended every 3 years, at minimum. Due to its age (currently 84 years old), Reservoir 1212-3 is expected to eventually be taken out of service.

When Reservoir 1212-3 is taken out of service, two additional 8 MG reservoirs (Reservoirs 1212-4A and 1212-4B) are recommended for the 1212 Zone to replace Reservoir 1212-3. The City has acquired a site for these reservoirs near the intersection of Foothill Boulevard and Rochester Avenue in the City of Rancho Cucamonga. The reservoir site has an approximate ground elevation of 1,189 feet amsl. The City plans to tie into the 24-inch pipe (1212 Zone) on 4th Street at Buffalo Avenue. A 30-inch pipe will extend north on Buffalo Avenue east on San Marino Street, and north on Rochester Avenue to Reservoir 1212-4A and 1212-4B.

10-5.3 Booster Pump Stations

Per the established criteria for booster pump stations, three stations have outlived their useful life of 50 years. Booster pumps 1348-3 and 1348-4 are located at the pump station near Reservoir 1212-3. This pump station was constructed in 1959, and has reached the end of its useful life. Concurrent to this master planning effort, the City is conducting a condition assessment of this pump station, which will include recommendations to rehabilitate this facility.

The Galvin Pump Station includes three pumps (Galvin 1074-1, Galvin 1074-2, and Galvin 1074-3) that pump to the 1212 Zone and one pump (Galvin 1074-4) that pumps to the 1348 Zone. Built in 1960, this booster pump station has reached the end of its useful life. Likewise, the booster pump station that houses pumps 1348-1 and 1348-2 was constructed in 1960, and has reached the end of its useful life. It is recommended that a condition assessment of these pump stations be conducted to identify all necessary improvement projects.

10-5.4 Pipeline

The City has a pipeline replacement program that is intended to target the replacement of pipes that have exceeded their useful lives and/or have diameters that are less than the minimum 8-inch in diameter criteria. The City currently prioritizes the pipe replacement projects based on operational information such as historical pipe leaks, historical breaks, or maintenance issues.

Small Diameter Pipe

It is recommended that all small diameter pipe (less than 8-inches) be replaced with a minimum of 8-inch diameter pipe. Pipe improvements greater than the minimum 8-inch diameter criteria, may be required in areas where the system in unable to meet the minimum peak hour pressures and/or fire flow pressure criteria.

In addition, it is recommended that all small diameter fire hydrant laterals (less than 6-inches) be replaced with a minimum of 6-inch diameter pipe. The City Standard Drawing Number 4111 require the hydrant lateral to be 6-diameter PVC pipe. Older metal hydrant laterals were also recommended to be replaced with PVC pipe to reduce headless through the hydrant lateral in a fire flow event.

The geometry for the future system model scenario was adjusted such that the minimum pipe diameter is 8-inches, and the minimum fire hydrant lateral diameter is 6-inches.

Pipes Exceeding Useful Lives

The existing distribution system pipes were installed between 1916 and 2018. The system pipe length by decade of construction is shown in Figure 6-5. The majority of the distribution system was constructed after 1970. The year of installation is unknown for about 28 miles or 4.8 percent of the existing pipes.

As detailed in Table 7-2, the pipe useful life for DIP, ACP, and PVC pipe is 50 years, which means pipes constructed before 1970 have exceeded their useful lives. Pipe replacements due to age are planned for all pipes constructed on or before 1970. This excludes small diameter pipe improvements.

The total length of pipe replacements due to size and age, is estimated as 1,105,000 feet (209 miles). A summary of the recommended existing water system pipeline improvements is shown in Table 10-4. Locations of fire flow, small diameter, and age improvements are shown on Figure 10-3.

Table 10-4

Summary of Existing Water System Improvements

10-5.5 Pressure Reducing Stations

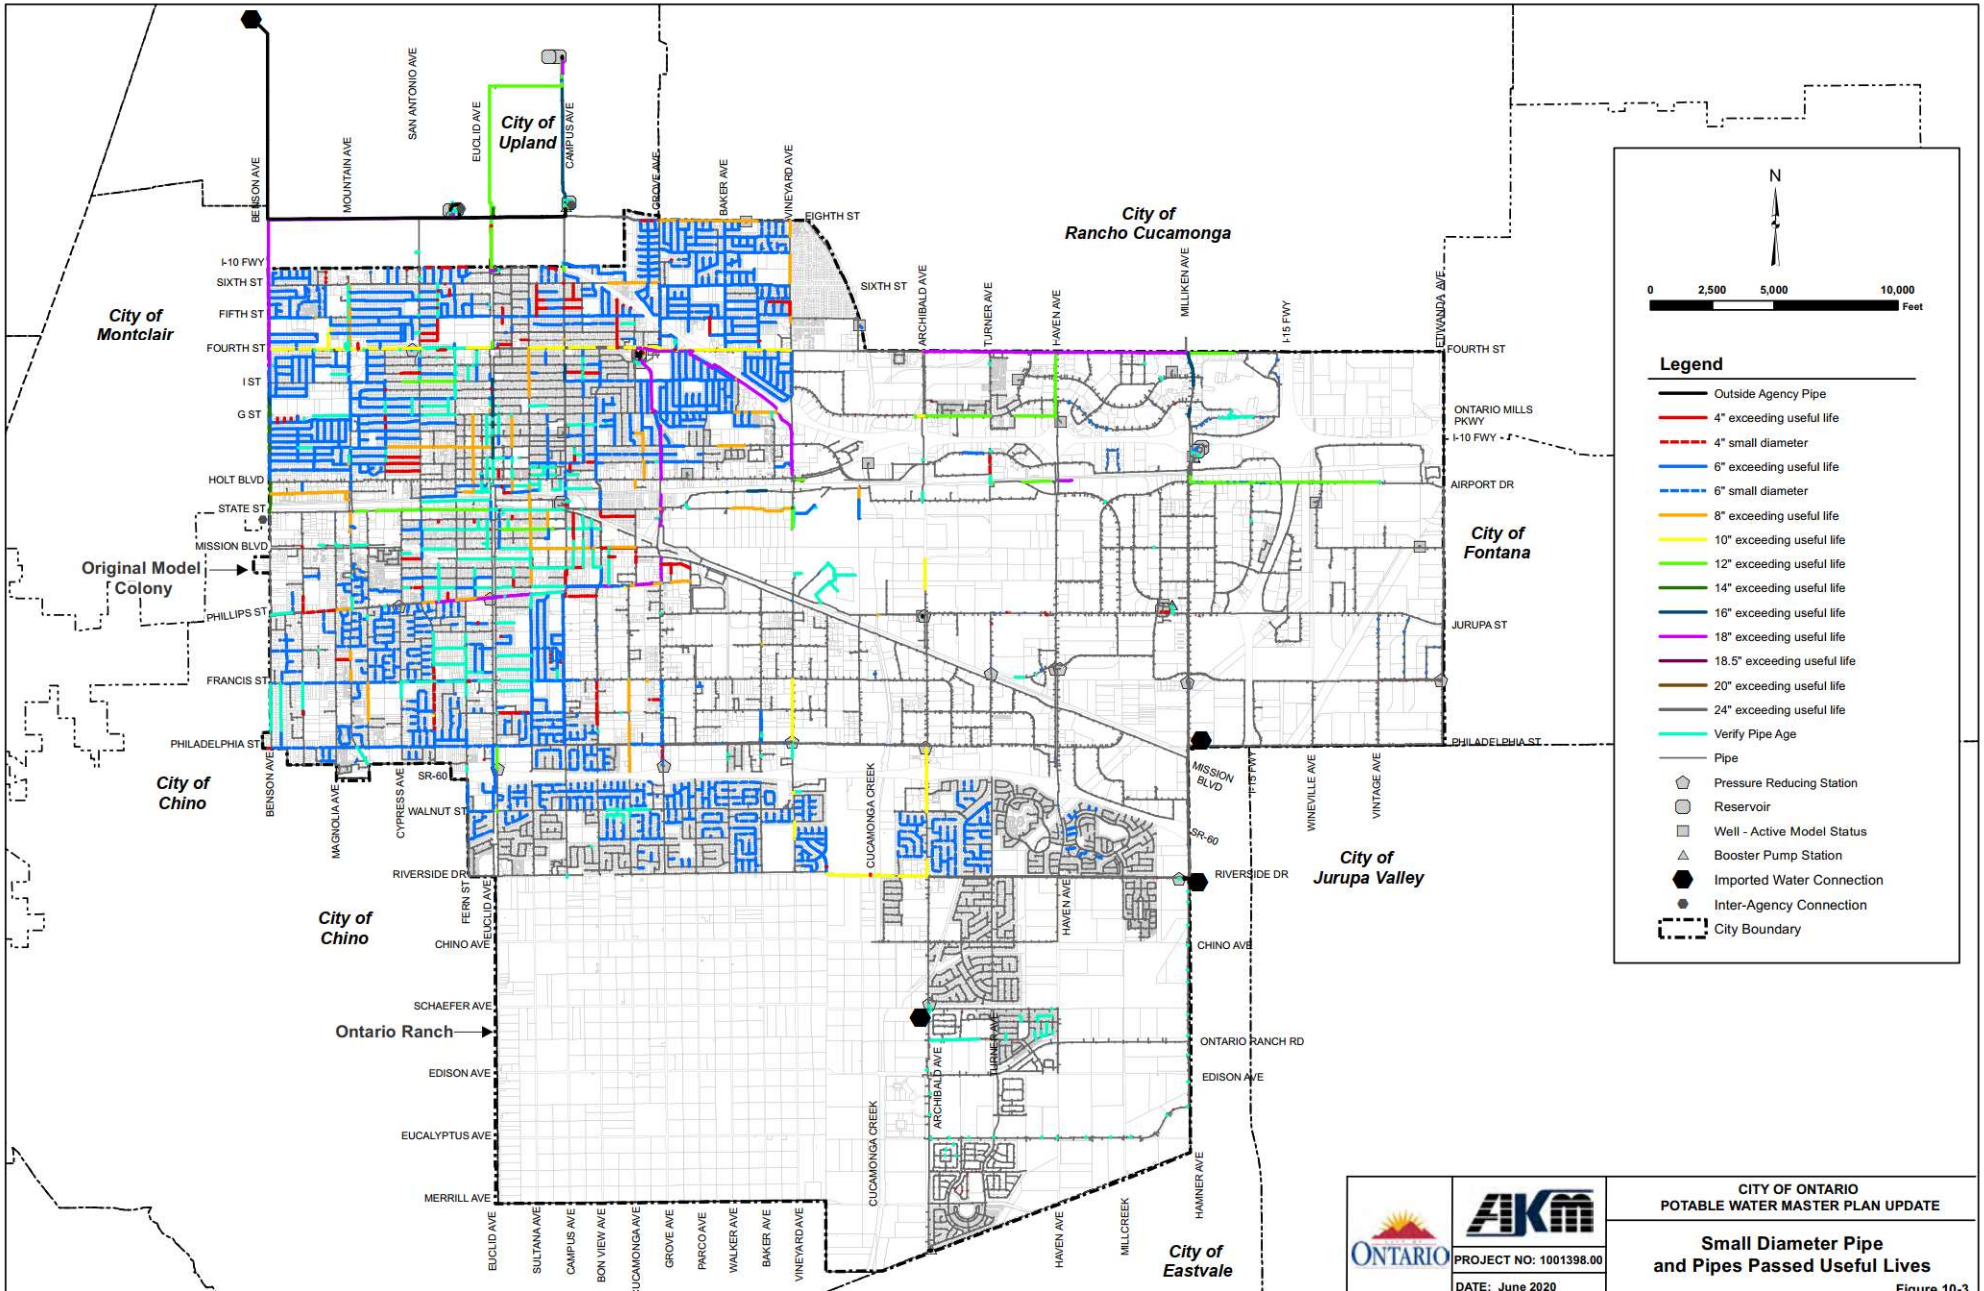
The City is in the process of rehabilitating all pressure reducing stations. New valves and vaults will be provided at all stations. The SCADA will also be updated to provide upstream pressure, downstream pressure, and flowrate.

10-5.6 Facility Back-up Power

The system has to be able to provide service during commercial power outages. Currently, the wells with standby power are Well 40 (1074 Zone), 41 (1212 Zone), 46 (1348 Zone), 47 (1212 Zone), and 49 (925 Zone).

All future pump stations and wells should be constructed with standby power so that at least one average day demand can be conveyed to each zone from the wells. If well capacity is not sufficient, water can be transferred via pressure reducing stations and/or booster pump stations with backup power.

Most wells are equipped with automatic transfer switches, which may be connected to a portable generator. The City plans to rehabilitate Well 31 and Well 39 with automatic transfer switches. The City currently has three (3) 850 KW and one (1) 530 KW portable generators. The City plans to purchase an additional 850 KW portable generator.



ONTARIO

AKM

CITY OF ONTARIO
POTABLE WATER MASTER PLAN UPDATE

PROJECT NO: 1001398.00

DATE: June 2020

Small Diameter Pipe and Pipes Passed Useful Lives

Figure 10-3

10-5.7 Water Service Meters

The existing system consists of approximately 36,750 water service meters. The City has an aggressive meter replacement program in place. In the 2021 Fiscal Year, approximately 4,000 meters are scheduled to be replaced. This equates to about a 12 year replacement schedule.

In addition to the meter replacements, approximately 1,600 meters are scheduled to be installed for new development areas in the 2021 Fiscal Year.

10-5.8 Communication Upgrades

The City is adding an additional wireless Ethernet radio system to their SCADA network. The older spread spectrum 900 mhz system will remain as a backbone. The new radio network will have much more bandwidth and provide more capabilities such as video from remote sites. Not all RTU are set up for Ethernet, and some hardware will need to be upgraded.

10-5.9 RTU/PLC Upgrades

SLC PLC systems make up approximately 95% of the City's system. Over the past 20 years, these have been the backbone of many water systems. Currently, the industry is moving toward faster PLC systems. Since the City's radio system is being upgraded, many of the PLC's will also need to be upgraded. The City is evaluate the necessary upgrades and schedule on a site-by-site basis. All new facilities will be installed with equipment that is compatible with the new Ethernet radio system.

10-5.10 Site Security

Once the SCADA upgrades are completed, the City will incorporated site security upgrades. The City will install security cameras and secure gate motors at all sites.

SECTION 11
FUTURE SYSTEM

11-1 Introduction

The future potable water system will consist of five pressure zones as shown on Figure 11-1. As Ontario Ranch is developed, the 1010 Zone will be expanded further south to Chino Avenue. The remaining Ontario Ranch area will be a part of the 925 Zone. A hydraulic schematic of the future potable water system is shown on Figure 11-2.

11-2 Developer Impact Fee Projects

The City has developed projects for the future system expansion. Developer Impact Fee (DIF) projects were provided by the City and incorporated into the future system model and capital improvement program. The DIF projects primarily include reservoirs, wells, pump stations, pipelines, water quality treatment facilities, and pressure reducing stations that will serve the Ontario Ranch (OR) developments in the 925 Zone and the 1010 Zone. It also includes transmission pipeline projects in the Original Model Colony (OMC) that will improve the overall system operations, including new development in OR and redevelopment in the OMC.

11-3 Future Facilities

As detailed in Section 8, the future system scenarios were developed in the hydraulic model to include all future facilities, which include all recommendations included from the existing system analysis.

11-3.1 Future Wells

The summary of all active wells that are included in the future model are detailed in Table 11-1.

11-3.2 Future Reservoirs

The summary of all active reservoirs that are included in the future model are detailed in Table 11-2.

11-3.3 Future Booster Pump Stations

The summary of all active booster pump stations that are included in the future model are detailed in Table 11-3.

11-3.3 Future Pressure Reducing Stations

The summary of all active pressure reducing stations that are included in the future model are detailed in Table 11-4.

11-4 Future 925 Zone Facilities

The future 925 Zone will provide water service to the majority of Ontario Ranch. This zone is generally bounded by Chino Avenue to the north, Euclid Avenue to the west, the City boundary to the south, and Milliken Avenue to the east. Table 11-5 summarizes the existing 925 Zone facilities and the recommended facilities that are yet to be constructed. The facility locations are shown on Figure 11-1.

One additional 6 MG reservoir and two 9 MG reservoirs are recommended for the 925 Zone which will ultimately provide service to most of the OR service area. The proposed 6 MG reservoir will be located adjacent the existing 6 MG reservoir (Dupont Ave and Jurupa St). The two 9 MG reservoirs are planned to be located between Bon View Avenue and Cucamoga Avenue, north of Francis Street. Treatment facilities will be provided at both reservoir sites to treat groundwater before entering the distribution system.

Seven new wells are planned in the 925 Zone to provide an additional 17,000 gpm capacity for the future growth in this area.

PRS 16 will reduce pressures from the 1010 Zone to the 925 Zone, near Chino Avenue and Campus Avenue.

11-5 Future 1010 Zone Facilities

The southerly boundary of the existing 1010 Zone will ultimately be expanded south to Chino Avenue from Euclid Avenue to Milliken Avenue. Currently, mainline pipes are planned in major streets as shown on Figure 11-3. The future pipes will tie into existing 1010 Zone pipes in Riverside Drive.

The following additional facilities are recommended to improve the redundancy of supply into the 1010 Zone:

- Well 39 and Well 50 upgrades will be made to provide water quality treatment, such that the pumps may be reactivated.
- Well 37 will be retrofitted to pump from the 1212 Zone to the 1010 Zone. Currently this well pumps to the 1212 Zone.
- New PRS 23 will reduce pressures from 1074 Zone to 1010 Zone, near Campus and the SR60 Freeway.
- New PRS FUTURE1. Will reduced pressures from the 1074 Zone to the 1010 Zone, near Euclid Avenue and the SR60 Freeway.
- A new booster pump station from 925 Zone to 1010 Zone is recommended to provide water to 1010 Zone in emergencies or when storage reserves are low. The location of this future pump station is near the future Reservoirs 925-1A and 925-1B.

11-6 Future 1074 Zone Facilities

The following improvements are necessary for facilities that have reached the end of their useful lives or require system upgrades.

- All existing wells in the 1010 Zone (Well 35, 36, 40, 44, 45, and 52) are currently operational; however, due to existing and upcoming water quality issues, treatment and/or other facility improvements maybe required.
- Improvements are necessary for Reservoirs 1074-1A and 1074-1B, based on the City's recommendations included in the 2012 Seismic Risk of City's Potable Water Reservoirs technical memorandum. While Reservoir 1074-1B (2 MG) was constructed in 1957 and has reached the end of its useful life, it is expected that the reservoir may continue operating once the recommended rehabilitation project has been implemented. This reservoir should be re-inspected and condition assessed every three (3) years, at minimum, to determine the additional rehabilitation/replacement project needs.
- The John Galvin Pump Station was constructed in 1960 and has reached the end of its useful life. It is recommended that a condition assessment of this pump station be conducted to identify all necessary improvement projects.

11-7 Future 1212 Zone Facilities

The following additional facilities are recommended to improve the redundancy of supply into the 1212 Zone:

- It is recommended that the future 1212 Zone include two additional 8 MG reservoirs (1212-4A and 1212-4B) to replace the existing Reservoir 1212-3 and to meet the storage criteria.
- Under future conditions, the City has access of up to 25 mgd capacity from the WFA connections in the 1212 Zone and 1348 Zone. Currently, the City's operations staff have experienced a maximum of 15.4 mgd from these turnouts.
- The City will construct Well 42 and Well 43 to provide an additional 5200 gpm capacity to the 1212 Zone. Well 43 has been drilled, but needs to be equipped before being placed into service.

The following improvements are necessary for facilities that have reached the end of their useful lives or require system upgrades.

- Well 38, 41, and 47 are currently operational; however, due to existing and upcoming water quality issues, treatment and/or other facility improvements may be required.
- Wells 24, 29, 30, and 31 will also require facility upgrades to meet water quality requirements. These wells are also expected to reach the end of their useful lives in the next 10 to 20 years. It is recommended that the City evaluate the condition of these wells to determine if additional improvements or replacement is necessary.
- Reservoir 1074-1A (20 MG) and Reservoir 1074-1B (2 MG) were constructed in 1959 and 1958, respectively. Per the criteria for concrete reservoirs, these facilities have reached the end of its useful life. These reservoirs should be re-inspected and condition assessed every three (3) years, at minimum, to determine the rehabilitation/replacement project needs.
- Booster pumps 1348-3 and 1348-4 are located at the pump station near Reservoir 1212-3. This pump station was constructed in 1959, and has reached the end of its useful life. Concurrent to this master planning effort, the City is conducting a condition assessment of this pump station, which will include recommendations to rehabilitate this facility.
- The booster pump station that house pumps 1348-1 and 1348-2 was constructed in 1960, and has reached the end of its useful life. It is recommended that a condition assessment of these pump stations be conducted to identify all necessary improvement projects.

11-8 Future 1348 Zone Facilities

The following improvements are necessary for facilities that have reached the end of their useful lives or require system upgrades.

- Well 46 is currently operational; however, due to existing and upcoming water quality issues, treatment and/or other facility improvements will be required.
- Reservoir 1348-1B (2 MG) and Reservoir 1074-1C (3.75 MG) were constructed in 1955 and 1958, respectively. Per the criteria for concrete reservoirs, these facilities have reached the end of its useful life. These reservoirs should be re-inspected and condition assessed every three (3) years, at minimum, to determine the rehabilitation/replacement project needs.

SECTION 12

FUTURE SYSTEM ANALYSIS

12-1 General

The established system criteria and calibrated system computer model were utilized in analyzing the system, and evaluating its adequacy. As discussed in Section 10, the model was utilized to perform the existing system analyses. The hydraulic model was updated to include the existing system improvement projects that were identified in Section 10 and the known future system facility expansion projects detailed in Section 11.

The hydraulic model was used to identify existing deficiencies and develop mitigation projects based on the future system analyses under average day, maximum day, and peak hour and maximum day plus fire flow conditions.

A capital improvement program was developed as a result of these analyses. Recommended projects and cost estimates are discussed in Section 13 of this Master Plan Report.

12-2 Future Source of Supply

It is prudent to secure water supplies from multiple sources so that demands can be met at reasonable levels when one or more water sources are not available. The City's future water demands are summarized in Table 12-1.

For planning purposes, the City's future sources of supply must be able to meet the minimum City and state supply requirements.

Table 12-1

Future System Demand

Demand Description	Total System Demand (gpm)	(mgd)	(AFY)
Average Day	35,716	51.43	57,610
Max Day	54,778	78.88	88,357
Peak Hour[1]	73,132	105.31	117,963

[1] Estimated from Future System Model

12-2.1 Future Average Day Demand

The criterion established requires a source of supply equal to one average day demand (ADD) (35,716 gpm) from local sources.

The City's future source of supply is detailed in Table 12-2. The City's local water source include direct access to groundwater from the Chino Basin, which is managed by the Chino Basin Watermaster. The City's existing and future wells have a capacity of 65,330 gpm, which is about 183% the future ADD.

Table 12-2

Future Source of Supply

Source	Capacity gpm	mgd	AFY
Existing Wells[1]	35,530	51.2	57,310
Future Wells[1]	29,800	42.9	48,068
WFA	10,700	15.4	17,259
CDA	5,290	7.6	8,533
Total	**81,320**	**117.1**	**131,170**

[1] Well 37 will be retrofitted to pump to Zone 1010.

12-2.2 Future Maximum Day Demand

California Code of Regulations Related to Drinking Water requires a minimum source of supply of one maximum day demand (MDD) of the service area. Under this criterion, reservoirs are typically needed to regulate hourly fluctuations in demand, provide fire flow and supplement supply during an outage of a source for an extended duration.

As detailed in Table 12-2, the total future source of supply is equivalent to 81,320 gpm. This is about 149% of the City's future MDD (54,778 gpm). With 65,330 gpm from existing and future groundwater sources alone, the City is capable of providing the full projected MDD.

The available future imported water from the Chino Desalter Authority (CDA) and Water Facility Authority (WFA) total 15,990 gpm (29% of the future MDD). If some wells are out of service, the City would need 38,788 gpm (54,778 gpm – 15,990 gpm) from groundwater sources to supply the remaining MDD. This is about 59% of the future system well capacity.

12-2.3 Future Peak Hour Demand

California Code of Regulations Related to Drinking Water, Chapter 16, Section 64554 requires that if a system has more than 1,000 service connections, it must be capable of providing four (4) hours of peak hourly demand (PHD) through a combination of source capacity, storage capacity, and/or emergency source connections.

The estimated future peak hour demand from the hydraulic model is 73,132 gpm. The City's future total supply (81,320 gpm) is greater than the peak hour demand. Storage capacity is not necessary to meet the future peak hour demand supply criteria.

12-3 Storage

12-3.1 Storage Criteria Summary

Operational Storage

For the City of Ontario's system, operational storage criterion is based on 30 percent of the maximum day demand for OR, and 25 percent of maximum day demand for OMC due to the diversity of demands in OMC.

Emergency Storage

The City's emergency storage criterion is set at one average day demand. For a system that depends mostly on groundwater supplies, this amount of emergency storage is adequate and is primarily for response in operations due to a loss of a major source of supply.

Fire Suppression Storage

Fire suppression storage is the volume required to supply the service area with the required fire flows, which range from 1,500 to 4,000 gpm for a duration of two (2) to four (4) hours.

The fire flow suppression storage and operational storage is increased by 15 percent so that a portion of the reservoir volume is available for variations in elevation, and to provide submergence over the reservoir outlet pipes. In an emergency, the emergency storage volume, as well as the operational storage volume and the fire suppression storage volume would all be available for use.

12-3.2 Future Storage Analysis

With anticipated development in the OR service area, the City is planning for additional storage in the 925 Zone 925 and the 1212 Zone. Table 12-3 shows the future storage capacity in each zone, and the reservoir capacity.

Table 12-3

Future Storage Analysis

Zone	1348	1212	1074	1010	925	Total System
Average Day Demand (mgd)	3.08	16.27	5.91	9.06	17.12	51.43
Maximum Day Demand (mgd)	4.89	25.17	9.16	13.98	25.68	78.88
[1]Fire Flow Demand (gpm)	3,500	4,000	4,000	4,000	4,000	-
Fire Flow Duration (hrs)	4	4	4	4	4	-
[2]Fire Suppression Storage (MG)	0.84	0.96	0.96	0.96	0.96	-
[3]Operational Storage (MG)	1.22	6.29	2.29	3.49	7.70	21.00
[4]Emergency Storage (MG)	3.08	16.27	5.91	9.06	17.12	51.43
[5]Total Storage Required (MG)	5.45	24.61	9.65	14.18	27.08	80.97
[6]Existing Available Storage (MG)	8.75	38.00	4.75	23.50	30.00	105.00
Zone Surplus / Deficit (MG)	3.30	13.39	-4.90	9.32	2.92	24.03

[1] Highest fire flow required in zone

[2] Fire flow multiplied by duration

[3] 30% of maximum day demand for NMC, 25% of maximum day demand for OMC

[4] One average day demand

[5] (1.15 x (fire suppression+operational storage))+emergency

A deficit of 4.90 MG is calculated in the 1074 Zone. The construction of additional storage in the 1074 Zone is not recommended due to cost of construction and locating an appropriate site. There is 13.39 MG of surplus storage within the 1212 Zone that could be transferred to the 1074 Zone through altitude valve 1074A at the Reservoir 1074-1 site, as well as through PRS 6, 10, 11, 12 and 21 to make up for this deficit.

12-4 Pipeline Replacement Program

As detailed in Section 10-3.4, the City has a pipeline replacement program that is intended to target the replacement of pipes that have exceeded their useful lives and/or have diameters that are less than the minimum 8-inch in diameter criteria. The City currently prioritizes the pipe replacement projects based on operational information such as historical pipe leaks, historical breaks, or maintenance issues.

Approximately 1,105,000 feet of pipe will need to be replaced due to size and or age.

12-5 Future System Hydraulic Model Analysis

The future system model scenarios include the known future facilities, the future development demands, the future supplies, and planned future operations. As detailed in Section 10-5-4, pipe replacements are recommended for all pipes less than 8-inches in diameter and for all pipes that were constructed after 1970. Likewise, fire hydrant lateral replacements were recommended for hydrant laterals with diameters less than 6-inch, as well as older metal pipes that experience higher friction losses. The geometry for the future system model scenario was adjusted such that the minimum pipe diameter is 8-inches and minimum hydrant lateral diameter is 6-inch minimum.

12-5.1 Future Average Day Demand and Maximum Day Demand Scenarios

The pressures during the future ADD scenario were above the City's dynamic pressure criteria (40 psi) throughout the service area. The future system was also evaluated under the MDD scenario, which include the peak hour demand. All system pressures meet the City's minimum pressure requirements. The future system analysis resulted in the 24-hour average pressure contours shown on Figure 12-1.

For the future system model scenarios, the pipe diameters were increased to meet the City's maximum velocity criteria of 7 ft/s or less. The maximum velocities are detailed on Figure 12-2. The 12-inch pipe on Archibald Avenue south of Riverside Drive has a maximum velocity of 7.1 feet per second, which is due to water moving between the 1010 Zone and 925 Zone, through PRS17. If these velocities affect the pipe condition, the valve setting may be adjusted to restrict the flowrate from the upstream piping.

12-5.2 Future Maximum Day plus Fire Flow Scenario

The future fire flow system analysis was conducted with known future facilities and demands under maximum day plus fire flow conditions.

Fire flow demands, as listed in Table 7-1, were applied at all model fire hydrant locations. If a fire node was located near multiple land use types, the highest fire flow demand was utilized. The fire flow criterion requires a residual pressure of 20 psi at the fire hydrant outlet. The system evaluation is therefore based on providing 20 psi at the model hydrant.

When the fire flow analysis was initially run, there were areas within the system that could not meet the fire flow requirement. These areas were generally industrial and high density residential land use types, where the fire flow requirement is 4,000 gpm and 3,500 gpm, respectively. The fire flow deficiencies were due to small pipe sizes or dead end mainlines. The City currently requires a minimum pipe size of 12-inch diameter in commercial and industrial areas. The initial fire flow deficiencies were often remedied by increasing the existing pipe diameter to 12-inches. In some cases, pipe looping was also necessary. The available fire flow contours at 20 psi for the future system are illustrated on Figure 12-3.

Hydrants that are unable to meet the fire flow requirement are also detailed on Figure 12-3 and summarized in Appendix 12-1. These hydrants are located on private property and require improvements to the private system. No recommendations were made to private pipes and laterals, and no private system improvements are included in the capital improvement program.

The recommended fire flow improvements are illustrated on Figure 12-4 and detailed in Table 12-4.

Table 12-4
Recommended Fire Flow Improvements

Zone	Fire Flow Deficiency Upsize	Fire Flow Deficiency Looping				Total Footage
	Future Size 12" (ft)	Future Size 6" (ft)	Future Size 8" (ft)	Future Size 12" (ft)	Future Size 16" (ft)

SECTION 13

CAPITAL IMPROVEMENT PROGRAM

13-1 Introduction

The primary goal of the Capacity Improvement Program (CIP) is to provide the City of Ontario with a long-range planning tool for implementing its water system improvements in an orderly manner and a basis for financing of these improvements. The CIP consists of projects that will enhance the system to meet the established criteria, properly maintain the system's assets, and replace the facilities that have reached the end of their useful lives.

13-2 Project Descriptions

Proposed facility improvement projects and costs are planning level estimates. Specific alignments and refined cost estimates should be developed as a part of the preliminary design phase for each recommended pipeline project.

It should be noted that some of the improvements recommended herein are conceptual in nature based on existing available planning information. Therefore, they should not be considered as absolute for final design. Further analysis and refinement will be necessary prior to commencing work on the final plans, specifications and estimates package for each project. Detailed preliminary design studies should be prepared to select the final design projects.

Improvement projects are categorized as Existing System Improvement Projects, Annual Improvement Projects, Condition Projects – Mainline Replacement Program, Condition Projects – Facility Improvement Program, or Future System Development Projects.

Existing System Improvement Projects include:

- Improvements identified from the hydraulic model analysis, such as velocity and fire flow deficiencies.
- Projects identified from the City's operations and engineering staff, to improve the condition of the main facilities such as reservoirs.
- Projects included on the City's existing DIF maps in the OMC area

Annual Improvement Projects are projects that need to be regularly updated and include:

- Reservoir recoating/repainting/ and repair improvements
- Meter replacement

Condition Projects – Mainline Replacement Program include:

- Small diameter pipes
- Pipes exceeding useful lives

Condition Projects – Facility Improvement Program include:

- Improvements to existing fire hydrant lateral size and/or material
- Wells exceeding useful lives
- Pump stations exceeding useful lives
- Reservoirs exceeding useful lives

Future System Development Projects include:

- DIF projects in the OR area

13-3 Project Cost Estimate

The capital improvement projects are developed based upon the results of the existing system analysis and future system analysis, which are described in detail in Section 10 and Section 12, respectively.

The cost estimates are based upon recent information for similar projects in the City of Ontario, and include contingencies for this planning level study. The cost estimates are based on the unit construction costs, detailed in Table 13-1. Pipeline costs take into consideration the size of the pipe as well as whether the construction will be within the OMC or OR areas. OMC is largely developed and there are many existing utilities to consider; therefore, the costs of replacing water pipes will be generally higher than the new construction costs in undeveloped areas such as OR.

Pipe improvements recommendations in the OMC are based on the replacement of the existing pipes. Replacement costs are generally more conservative and will therefore allow the City more flexibility for each project. Preliminary design studies should be conducted, utilizing detailed utility information to identify and evaluate project alternatives such as parallel pipes.

The estimated unit costs for wells include permanent back-up power.

Table 13-1
Unit Cost Summary

Type		Units	OMC	OR
Pipe	6-inch [1]	$/LF	$108.36	$72.00
Pipe	8-inch	$/LF	$144.48	$96.00
Pipe	12-inch	$/LF	$216.72	$144.00
Pipe	16-inch	$/LF	$288.96	$192.00
Pipe	18-inch	$/LF	$325.08	$260.06
Pipe	24-inch	$/LF	$433.44	$331.56
Pipe	30-inch	$/LF	$541.80	$403.05
Pipe	36-inch	$/LF	$650.16	$486.31
Pipe	42-inch	$/LF	$758.52	$557.81
Well		$/LS	$4,000,000.00	
Reservoir		$/MG	$1,444,800.00	
Pump Station		$/HP	$6,000.00	
PRS		$/LS	$680,260.00	
Treatment Plant		$/Well	$6,324,111.00	

[1] *6-inch recommendation for laterals only*

Cost estimates for currently planned improvement projects in the near future were provided by the City.

The total costs include construction, contingency, engineering, design, and construction management costs. The individual cost components are calculated as follows:

1. Base Cost = Unit Cost x Recommended Units
2. Contingency Cost for Original Model Colony Projects = 10% of the Base Cost
3. Construction Cost = Base Cost + Contingency Cost
4. Engineering and Design Cost = 10% of the Construction Cost
5. Construction Management Cost = 5% of the Construction Cost
6. Total Cost = Construction Cost + Engineering and Design Cost + Construction Management Cost

Construction costs can be expected to fluctuate as changes occur in the economy. These costs should therefore be reevaluated and updated annually based upon Engineering News Record (ENR) Index for the Los Angeles area (ENRLA), with the base ENRLA Index of 12,144.49 for January 2020.

The recommended CIP is detailed in Table 13-2. Project locations are shown on Plate-1. A summary of the total costs are as follows:

Existing System Improvement Projects:	$237,900,000
Condition Projects – Mainline Replacement Program:	$226,200,000
Condition Projects – Facility Improvement Program:	$89,600,000
Future System Development Projects:	$225,600,000
Total CIP cost:	**$779,300,000**
Annual Improvement Projects:	$3,600,000/Year

13-4 Project Priorities

The primary consideration in establishing project priorities for the capital improvement program list must always be given to the health, safety and welfare of the public and the customers. In general, the projects necessary to improve the existing system are scheduled earlier in the order of supply, pumping and storage.

With these guidelines, the projects recommended in this report and their estimated costs were examined and sorted. Each project is shown with its total estimated project cost. The City should review this schedule and adjust it annually to respond to changed conditions and to take advantage of concurrent construction such as street paving projects or adjacent infrastructure work.

Projects in Ontario Ranch or related to service to Ontario Ranch will be dependent upon the progression of development, which is continually changing. Therefore, the Ontario Ranch projects are not prioritized in Table 13-2.

Executive Summary

This Recycled Water Master Plan Update is to be used as a planning tool to guide future recycled water use and expansion of the existing recycled water system for the City of Ontario (City) over the course of the planning horizon. The planning horizon is identified to be the current General Plan.

The objective is to provide a cost-effective and fiscally responsible recycled water system CIP that will meet the needs of the future developments within the City, as well as the existing and future customers requirements for water delivery, system pressure, and reliability.

The future recycled water system has been developed for two major phases – Near-Term and Future. The Near-Term phase is assumed to be development in the Ontario Ranch and other recycled water conversion areas and connections to the recycled water system in the next 5-years, or approximately Year 2025. The Future phase is the remaining development of the Ontario Ranch to full build-out and other development areas and potential recycled water conversion areas as described herein in the Original Model Colony service areas.

Supply for the existing and future recycled water system demands is provided by Inland Empire Utilities Agency (IEUA). IEUA prepared a Recycled Water Program Strategy in 2015. This RWMP Update utilizes the hydraulic model used for that study. The IEUA Recycled Water Program Strategy developed a CIP with future improvements, including pumping and storage, to their 1158 and 1299 Zones to service the western portions of the 1158 and 1299 Zone service areas assuming all areas within the City are converted to recycled water. However, due to uncertainty in the timing of these facilities and reliance upon the recycled water improvements proposed by IEUA, this RWMP assumes the Future Phase as identified herein does not rely upon these improvements. Therefore, the Future Phase recycled water demands and potential conversion areas within the Original Model Colony are limited by IEUA's regional system's ability to provide the demands within the design criteria without these facilities.

RECYCLED WATER DEMANDS

Recycled water demands are estimated for the existing conditions, Near-Term, and Future phases. The Near-Term phase considers the following for estimating the projected recycled water demands:

- Current Developments in the Ontario Ranch service area – These developments are currently in the planning phase or design phase that are expected to begin in approximately 5-years.
- Creekside conversion project areas – These areas have already been previously studied and proposed for conversion to recycled water, and preliminary design plans have been prepared for many of the facilities to serve these areas.

- Some large irrigation meters/users that can be converted to recycled water – These parcels are assumed to be converted in the near future since they are in the vicinity of existing facilities or could be connected to a pipeline that is already proposed to be constructed.
- Parks and Schools that can be converted – These parcels have a high priority for the City where it is practical. These parcels are assumed to be converted in the near term since they are in the vicinity of existing facilities or could be connected to a pipeline that is already proposed to be constructed.
- Some agriculture land that can be converted to recycled water before it is ultimately developed – The agricultural use parcels that are adjacent to an existing pipeline or a pipeline that is to be constructed within the Near-Term planning horizon are assumed to be converted to the recycled water system.

The Future phase consists of the full build-out of the Ontario Ranch developments and all potential conversion areas within the Original Model Colony as identified in this study. The Euclid Avenue conversion areas are also considered to be Future phase improvements

The table below provides a summary of the projected recycled water demands. A slight increase in demands for the Original Model Colony area for the next 5 years can be expected due to the reduction in agricultural uses as development areas are constructed. As shown in the table, overall, the Near-Term phase has only a moderate increase of approximately 20 percent while the future demands increase by nearly 70 percent.

ES-1 Summary of Projected Recycled Water Demands

Service Area	Existing Recycled Water Demands (AFY)	Near Term Recycled Water Demands (AFY)	Future Recycled Water Demands (AFY)
Ontario Ranch	4,465	6,740	8,158
Original Model Colony	5,190	5,428	7,901
Total	**9,655**	**12,168**	**16,059**

RECYCLED WATER DISTRIBUTION SYSTEM

Hydraulic model analyses were conducted for a 24-hour EPS of the maximum day demands for existing, Near-Term, and Future phases of development of the recycled water system. No significant deficiencies to the distribution piping system were identified for existing conditions.

The Near-Term analysis sized the proposed pipelines so that the system meets design pressure and velocity criteria. In addition, to supplement the 930 Zone the two City PRV stations in Chino Avenue are assumed to be constructed. Each of these PRV stations reduces pressure from the 1050 Zone to the 930

Zone. These PRV stations will only open during peak demand periods. Approximately 12.2 miles of pipeline is proposed for the Near-Term, ranging from 8-inch to 30-inch diameter.

The Future system analysis shows that with the proposed piping system and booster pump station, the system meets all design criteria. In addition to approximately 51.9 miles of proposed pipelines ranging from 8-inch to 20-inch diameter, a 1050 to 1158 Zone Pump Station is proposed to supply the potential conversion areas in the western portion of the 1158 Zone. This pump station is anticipated to have a peak design capacity of 1,323 gpm, and be equipped with three pumps, each with 50-horsepower motors with variable frequency drives.

CAPITAL IMPROVEMENT PLAN

The CIP is divided into the two major phases of development as described herein, the Near-Term and Future phases. The Near-Term phase consists of the recycled water demands and expansion needs for the next 5-years, to approximately Year 2025. The Future phase consists of the full build-out of Ontario Ranch and other development and conversion areas within the Original Model Colony based on the City's General Plan.

ES-2 Summary of CIP Costs

Phase	Pressure Zone	Total Project CIP Costs
Near-Term	930	$5,843,879
	1050	$3,180,019
	1158	$399,848
	1299	$838,901
	PRV	$810,000
	Subtotal Near-Term	**$11,072,647**
Future	930	$21,170,803
	1050	$13,665,456
	1158	$21,119,491
	1299	$1,856,760
	Pump Station	$2,025,000
	Subtotal Future	**$59,837,510**
	Total CIP	**$70,910,157**

Ontario Recycled Water Master Plan
Figure ES-1 Future Recycled Water System

1.0 INTRODUCTION

1.1 PURPOSE AND SCOPE

The purpose of this document is to update the Recycled Water Master Plan (RWMP) prepared in 2012, with an updated Capital Improvement Plan (CIP). The 2012 RWMP was prepared by the Ontario Municipal Water Utilities Company (OMUC) staff and utilized the 2006 Water and Recycled Water Master Plan, Section 10 Recycled Water System as the basis for the update. OMUC recognizes the need to provide its customers with the most economically feasible source of water supply. With the decreasing supply and escalating costs of imported water, recycled water provides an alternate source of water supply for irrigation and some industrial processes.

The intent of this RWMP Update is to develop a document that can be used as a planning tool to guide future recycled water use and expansion of the existing recycled water system for the City of Ontario (City) over the course the planning horizon. The planning horizon is identified to be the current General Plan with anticipated buildout in year 2040.

The objective is to provide a cost-effective and fiscally responsible recycled water system CIP that will meet the needs of the future developments within the City, as well as the existing and future customers requirements for water delivery, system pressure, and reliability.

The scope for this RWMP Update includes achieving the following goals.

- Update the current Recycled Water Master Plan prepared in 2012;
- Create an updated hydraulic model in InfoWater modeling software that includes the IEUA supply facilities;
- Update existing, interim, and ultimate projected recycled water demands, based on the recent demand factor study prepared for the Urban Water Management Plan 2016 Update;
- Analyze and determine recommendations for recycled water system improvements and system expansion needs to meet ultimate recycled water demands; and,
- Develop a long-range Capital Improvement Plan.

1.2 STUDY AREA

The OMUC's service area comprises the City of Ontario and encompasses approximately 49.79 square miles. As shown in Figure 1-1, the service area is generally bordered by Cities of Rancho Cucamonga and Upland to the north, Cities of Fontana and Jurupa Valley to the east, City of Eastvale to the southeast and south, City of Chino to the southwest and south, and City of Montclair to the west. OMUC’s service area will be referred to as the Study Area from hereon.

The Study Area is divided into two main areas divided by Riverside Drive, the Original Model Colony (OMC) and the Ontario Ranch (OR), which was previously called the New Model Colony (NMC). OMC, located north of Riverside Drive, covers an area of approximately 37.00 square miles. OMC consists of existing residential, commercial, and industrial developments. Ontario Ranch (or NMC), located south of Riverside Drive, covers an area of approximately 12.79 square miles. Ontario Ranch mainly consists of agricultural land and vacant land; however, this area is a large growth area with many development projects planned for a mixture of residential, commercial, industrial, and public uses.

The City’s recycled water (RW) system has several pipelines that are connected to the Inland Empire Utilities Agency (IEUA) recycled water mains. However, the City operates and maintains its own recycled water system that delivers recycled water to its customers.

1.3 DATA SOURCE AND MODEL

Previous studies for the recycled water system are:

- Ontario Recycled Water Pipeline Project: *Pipeline Sizing Memo* by Michael Baker, July 2016
- Ultimate City-Wide Water Demand Estimate Memo by AKM, May 2016
- Inland Empire Utilities Agency (IEUA) Recycled Water Program Strategy (RWPS), October 2015
- Study of Recycled Water Pressure Zone 930 (Elimination of pipe in Chino Ave) by AKM, April 2014
- City of Ontario Recycled Water Master Plan, April 2012

Reference documents for this report are as follows.

- The Ontario Plan (General Plan), February 2010
- California Code of Regulations Title 14 and Title 17

InfoWater 12.4 is used to conduct the analysis. Data sources are shown below.

- Existing Recycled Water Customer Billing Data from 2009 to 2018.
- Demand Factors and Demand Pattern from Ultimate City Wide Water Demand Estimate Memo (AKM, May 2016) and IEUA Recycled Water Program Strategy, October 2015.
- GIS data provided by the City of Ontario:
    - Land use data received on October 31, 2018.
    - Recycled water system data received on October 31st, 2018, which included recycled water mains, laterals, system valves, hydrants, meters, active recycled water meters with customer data, geocode points locations of active meters, parcel data, and street centerlines.
    - Recycled water meter locations, received on November 1, 2018.

2.0 EXISTING AND FUTURE LAND USES

2.1 EXISTING LAND USE

The existing land use and general land use categories are shown in Table 2-1 and illustrated on Figure 2-1. The existing land uses are identified using the City's GIS Existing Land Use database layer, aerial map overlay, and the land uses shown in the 2016 Ultimate Citywide Water Demand Estimate Technical Memorandum.

Table 2-1 Existing Land Use

General Land Use Category	Existing Land Use Designation	Acres
Residential	LDR	5,134
	LMDR	357
	MDR	328
	HDR	454
Commercial	Admin./Prof.	143
	Commercial	1,245
	Office Commercial	514
	Misc. Service Org.	116
Industrial	Manufacturing	1,716
	Industrial	2,116
	Warehousing	1,807
Parks/Rec/Cultural	Parks/Rec/Cultural	772
Public Facilities	Public Facilities	165
School	School	497
Transportation/Utilities	Transp/Utilities	3,242
Agricultural	Ag. Multi-Use	6,470
Right of Way	Street/Parking	264
	ROW	323
Vacant	Vacant	1,608
	Vacant Bldg	87
	Total	**27,359**

[1] Vacant, vacant building and agriculture land use that have been identified through aerial map as developed land are assigned land use based on general plan. Area of mix use land use is counted to commercial category.

[2] The table does not include area of ROW in OMC.

As shown in Figure 2-1, the OMC area (north of Riverside Drive) is mostly built-out. The OMC consists predominantly of Industrial, Commercial, and Single-Family Residential uses. The Ontario Ranch service area (south of Riverside Drive) is predominantly undeveloped or Agricultural land.

2.2 FUTURE LAND USE DESIGNATIONS

The future land use categories and designations are shown in Table 2-2. These land uses are based on the City's current General Plan, as amended in March 2017.

Table 2-2 General Plan Land Use Designations

General Category	Land Use Designations	Abbr.	Density/ Intensity	Intention
Residential	Rural Density Residential	RR	< 2 du/ac	Single-family detached, typically an estate setting.
	Low Density Residential	LDR	>2 -5 du/ac	Single-family detached residences
	Low Medium Density Residential	LMDR	5 -11 du/ac	Includes small lot subdivisions, townhouses, mobile home parks.
	Medium Density Residential	MDR	11-25 du/ac	Single/multi-family attached and detached residences including townhouses.
	High Density	HDR	25-45 du/ac	Multi-Family residences
Commercial	Neighborhood Commercial	NC	0.4 FAR	Local serving predominantly residential neighborhood.
	General Commercial	GC	0.4 FAR	Local and regional serving retail, personal service, entertainment, dining, office, tourist-serving, and related commercial uses.
	Office Commercial	OC	0.75 FAR	Includes professional offices in a neighborhood setting
	Business Park	BP	0.6 FAR	Includes corporate offices, technology centers, research and development, "clean" industry, light manufacturing, and supporting retail.
	Hospitality	HOS	1.0 FAR	Regional including convention centers, hotels/motels, and entertainment.
Industrial	Industrial	IND	0.55 FAR	Variety of light industrial uses, including warehousing/distribution, assembly, and light manufacturing.
Open Space	Open Space- Non-Recreation	OS-OR	N/A	
	Open Space – Recreational	OS-R	N/A	
	Open Space – Water	OS-W	N/A	Accommodates recreational uses such as boating and fishing.
Public	Public Facilities	PF	N/A	Includes transportation facilities and museums.
	Public School	PS	N/A	Public schools (K-12) and universities.
	Airport	ARPT	N/A	Ontario Airport
	Right of Way	ROW		

[1] Designations listed above only included those shown and provided within the GIS Database. For additional designations, please refer to General Plan LU-02.

[2] FAR: Floor Area Ratio

2.3 FUTURE LAND USES

The future land uses are based on the current General Plan and the land use designations as shown in Table 2-2. For the OMC area, since most of the area has been built out, the land use types will largely remain the same, with the exception of the Mixed-Use areas. The Mixed-Use areas are predominantly high density residential and commercial uses. The eastern OMC consists mainly of industrial uses, whereas the western OMC is mostly residential uses. Table 2-3 provides a summary of the future land uses and acreages.

Table 2-3 Future Land Use

Service Area	General Land Use Category	Land Use	Abbr.	Acres
Original Model Colony (OMC)	Residential	Rural Density Residential	RR	529
		Low Density Residential	LDR	4,321
		Low Medium Density Residential	LMDR	448

[1] The table does not include street ROW that are shown in Figure 2-2 in OMC. However, OR does include areas to become become future street ROW.

2.3.1 Growth Areas

2.3.1.1 Mixed Use Areas

Based on the General Plan, the areas with anticipated growth are primarily identified within the Mixed-Use areas and within the Ontario Ranch area south of Riverside Drive. There are twelve Mixed-Use areas, with ten of these areas located in the OMC area. Each Mixed-Use area accommodates primarily commercial and residential uses. Densities and intensities vary by area and are designated by Area or Specific Plans.

Table 2-4 Growth Areas – Mixed Use Areas

Mixed Use Area		Residential Density & Non-residential Intensity	Acres
Original Model Colony			
1	Downtown	• >25.0 to 75.0 dwelling units per acre • 2.0 FAR for retail and office uses	178
2	East Holt	• >14.0 to 40.0 dwelling units per acre • 2.0 FAR for office uses • 1.0 FAR for retail uses	70
3	Meredith	• >14.0 to 125.0 dwelling units per acre • 3.0 FAR for office and retail uses	275
4	Multimodal	>20.0 to 80.0 dwelling units per acre • 1.0 FAR for office and retail uses	83
5	Inland Empire Corridor	>14.0 to 30.0 dwelling units per acre • 2.0 FAR for office uses • 1.0 FAR for retail uses	41
6	Guasti	• >25.0 to 65.0 dwelling units per acre • 1.0 FAR for office and retail uses	94
7	Ontario Center	• >20.0 to 125.0 dwelling units per acre • 2.0 FAR for office uses • 1.0 FAR for retail uses	410
8	Ontario Mills	>25.0 to 85.0 dwelling units per acre • 1.5 FAR for office uses • 1.0 FAR for retail uses	278
9	Euclid/Francis	• >14.0 to 25.0 dwelling units per acre • 1.0 FAR for retail uses	10
10	60/Hammer	20.0 – 30.0 dwelling units per acre • 1.0 FAR for retail and office uses	42
Ontario Ranch			
11	NMC East	• >14.0 to 50.0 dwelling units per acre • 0.7 FAR for office and retail uses	314
12	NMC West	• >14.0 to 65.0 dwelling units per acre • 1.5 FAR for office uses • 1.0 FAR for retail uses	315

[1] The acres include right of way within mix use areas.

Figure 2-2 illustrates the future land uses in accordance with the General Plan land uses. The Mixed-Use areas are also depicted to show the areas of anticipated growth and development.

Ontario Recycled Water Master Plan
Figure 2-2 Future Land Use

2.3.1.2 Ontario Ranch

Ontario Ranch will consist of the largest development area within the City. Most of the existing area is either vacant or used for Agricultural purposes. According to the General Plan, in addition to the Mixed-Use areas described in the previous section, the majority of the Ontario Ranch area will be developed for Low Density Residential and Industrial uses. There are several development projects within Ontario Ranch already being developed or in the planning stages. These projects area shown in Figure 2-3.

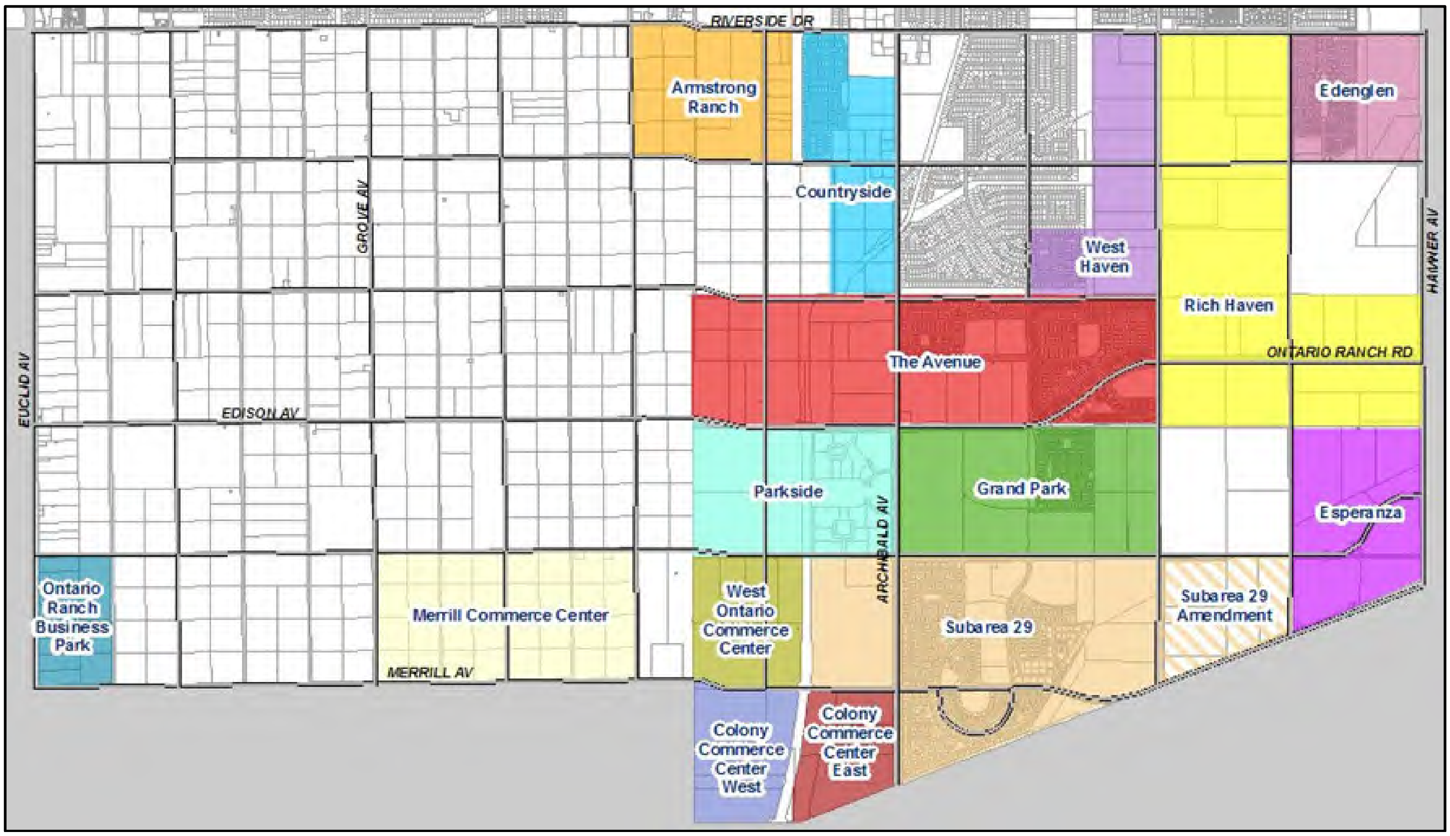

Figure 2-3 Ontario Ranch Current Projects

Table 2-5 provides a summary of the acreages and proposed land uses within each of the current projects shown in Figure 2-3.

Table 2-5 Current Ontario Projects

Current Project	Total Area	Land Uses Proposed
Grand Park (Approved)	320 acres	• 740 single family units • 587 multi-family units
The Avenue (Approved)	568 acres	• 2,313 single family units • 562 multi-family units • 130,000 s.f. commercial
Subarea 29 (Approved	539 acres	• 2,392 single family units • 87,000 s.f. commercial
Rich Haven	584 acres	• 1,833 single family units • 5361 multi-family units • 1.13 million s.f. commercial
Parkside (Approved)	250 acres	• 437 single family units • 1,510 multi-family units • 115,000 s.f. commercial
Esperanza (Approved)	233 acres	• 914 single family units • 496 multi-family units
West Haven (Approved)	199 acres	• 753 single family units • 87,000 s.f. commercial
Edenglen (Approved)	160 acres	• 310 single family units • 274 multi-family units • 217,520 s.f. commercial • 550,000 s.f. business park
Countryside (Approved)	178 acres	• 819 single family units
Armstrong Ranch (Approved)	199 acres	• 994 single family units
Colony Commerce Center West (Approved)	123 acres	• 2.95 million s.f. industrial
West Ontario Commerce Center (Approved)	125 acres	• 1.79 million s.f. industrial • 555,000 s.f. business park
Colony Commerce Center East (Approved	95 acres	• 2.2 million s.f. industrial
Subarea 29 Amendment	125 acres	• 574 single family units
Merrill Commerce Center	308 acres	• 5.8 million s.f. industrial • 1.2 million s.f. business park
Ontario Ranch Business Park	84 acres	• 410,000 s.f. business park • 1.38 million s.f. industrial

3.0 REGIONAL RECYCLED WATER SUPPLY

3.1 INLAND EMPIRE UTILITIES AGENCY (IEUA)

As one of the Member Agencies of IEUA, OMUC receives recycled water supply from IEUA. The recycled water supply is delivered via direct pipeline connections from the IEUA transmission system. The connections to IEUA are not separately metered or controlled.

The IEUA's recycled water supply is produced from wastewater collected and treated at tertiary wastewater treatment plants, mainly from Regional Water Recycling Plant No. 1 (RP-1), Regional Water Recycling Plant No. 4 (RP-4), Regional Water Recycling Plant No. 5 (RP-5), and Carbon Canyon Waste Recycling Facility (CCWRF). The treated wastewater effluent supplies IEUA member agencies through IEUA's distribution system via 35 miles of pipelines, three booster pump stations, three storage reservoirs, and four pressure regulating stations.

3.1.1 IEUA Recycling Plants

RP-1 is located in the City of Ontario near the intersection of State Highway 60 and Archibald Avenue. This facility was originally commissioned in 1948 and has undergone several expansions to increase the design wastewater treatment capacity to the current 44.0 MGD and biosolids treatment capacity equivalent to a wastewater flow rate of 60.0 MGD. The water pumped into the RW distribution system meets the requirement of California Title 22 bacteriological water quality regulations. As a source of supply to the RW system, RP-1 supplies three pressure zones, namely the 930, 1050, and 1158 Pressure Zones, through three (3) effluent pump stations.

RP-4 is located in the City of Rancho Cucamonga, which has been in operation and producing RW since 1997. RP-4 treats an average flow of 10 MGD. The RP-4 facility has been expanded to a capacity of 14 MGD. The plant provides recycled water that meets the State of California Title 22 Regulations. When the demand in the RW system is less than the amount of water being produced, the excess recycled water is discharged to the plant storage pond and the filter backwash water is sent to RP-1.

RP-5, located immediately east of the IEUA's Administrative Headquarters on Kimball Avenue in the City of Chino, began operation in March 2004. The first phase of RP-5 was designed to treat 15 MGD. Ultimately, RP-5 will treat 60 MGD and process 68 MGD of solids combined from RP-5 and CCWRF. The effluent waters meet the State of California Title 22 Regulations. The water produced from this plant is pumped to the 800 Pressure Zone.

CCWRF is located in the City of Chino and has been in operation since May 1992. This facility serves the cities of Chino, Chino Hills, Montclair, and Upland. Liquids are treated at CCWRF, while the solids removed from the waste flow are treated at RP-2, located on Prado Road in the City of Chino. CCWRF treats an annual average flow of 9.5 MGD. CCWRF includes several treatment processes that contribute to providing quality recycled water pursuant to the State of California Title 22 regulations. The water is pumped into the RW distribution system 930 Pressure Zone.

3.2 EXISTING SUPPLY CONNECTIONS

Table 3-1 provides a summary of OMUC's existing recycled water supply connections to the IEUA recycled water system. Each connection is a direct pipeline connection and is not metered or controlled separately.

Table 3-1 OMUC Supply Points of Connections

No.	Location of POC	Pipe Connection Size	Pressure Zone
1	E 6th St / N Corona Ave	IEUA 30"/ Ontario 8"	1630
2	W 4th St / N Elderberry Ave	IEUA 30"/ Ontario 8"	1299
3	W 4th St / Anthony Munoz Hall of Fame Park	IEUA 30"/ Ontario 8"	1299

Ontario Recycled Water Master Plan
Figure 3-1 Regional Recycled Water Supply Facilities

4.0 EXISTING RECYCLED WATER SYSTEM INVENTORY

The existing recycled water system, including recycled water meters, in the Study Area are owned and maintained by OMUC. As of July 2018, there are 363 active recycled water meters, which consist of 343 meters for irrigation of landscaping and non-agricultural use, and 20 meters for agricultural or farmers' use.

4.1 PRESSURE ZONES

The preliminary pressure zone boundaries shown in Figure 4-1 are established based on surface elevation, pressure criteria, and IEUA's RWPS.

1630 Pressure Zone

IEUA's 1630 Zone is divided into separate service areas, the East and West 1630 Zones. As shown in Figure 4-1, the West 1630 Zone includes a small portion of OMUC's recycled water service area. This zone is supplied by the 1630 West Pump Station (which pumps recycled water from the 1299 Zone), and pumps to the 1630 West 3 MG storage tank. The 1630 pressure zone consists of a small portion of the City in the northern area and the whole area is north of the Freeway I-10 and East 6th Street and extends to the City's northern boundary.

1299 Pressure Zone

The 1299 Zone is supplied recycled water from the 1299 Zone Effluent Pump Station located at RP-4. This pump station can also pump recycled water from the lower 1158 Zone. The 1299 pressure zone is bounded on the north by the 1630 Zone and the northern City Boundary, and 1158 Zone to the south. It is bounded to the south by the 1158 Zone along the railroad, which is located to the north of Ontario International Airport, from the western city boundary to North Haven Ave, and then, to the north of Freeway I-10 to Freeway I-15; and then, along the city's northern boundary. The whole area above this boundary up to 1630 Pressure Zone is established as 1299 pressure zone.

1158 Pressure Zone

The 1158 Zone is supplied water from both the RP-1 and RP-4 facilities via 1158 Zone Effluent Pump Stations located at each. The 1158 pressure zone is bounded by the 1299 Zone to the north and 1050 pressure zone are divided along E. Francis St. from western city boundary to flood control channel next to Ontario Soccer Park, and then, along the channel southerly to California State Route 60 and then along the eastern city boundary to Route 60.

1050 Pressure Zone:

The 1050 pressure zone is bounded by the 1158 Zone to the north and the 930 Zone boundary to the south. The 1050/930 Zone boundary is along the Riverside Drive. The 1050 Zone is supplied directly from the 1050 Zone effluent pump station at RP-1. A 1158 to 1050 Zone PRV is also equipped at this facility to maintain system pressure and demands. No storage tank exists in this pressure zone. Connections to the OMUC pipelines are from the 24-inch to 42-inch IEUA transmission mains as shown in Figure 4-1.

930 Pressure Zone

The 930 Zone is bounded by the 1050 Zone along Riverside Drive to the north, and the southern boundary is along the City's southern boundary. The 930 Zone is supplied directly from two IEUA recycled water effluent pump stations at the CCWRF and RP-1. Most of the supply is from the RP-1 facility, in particular during the winter months. The 930 Zone contains a 5 MG storage tank located in the City of Chino Hills to the west. Supply and meter connections to the OMUC pipelines are from the 30-inch transmission main as shown in Figure 4-1.

Table 4-1 Pressure Zone Characteristics and Supply

Pressure Zone/HGL	Minimum Service Elevation in IEUA's RWPS	Maximum Service Elevation in IEUA's RWPS	IEUA Supply	Storage Tank
930	600-ft	778-ft	CCWRF, RP-1	5 MG
1050	746-ft	843-ft	RP-1	-
1158	813-ft	1,042-ft	RP-1, RP-4	13 MG (RP-4)
1299	971-ft	1,183-ft	RP-4	5 MG
1630	1,283-ft	1,465-ft	RP-4	3 MG (1630 West)

4.2 PRESSURE REDUCING STATIONS

The City owns and operates one existing pressure reducing station located at the intersection of Chino Avenue and Archibald Avenue. This PRV reduces pressure from the 1050 Zone to the 930 Zone. In addition, a second PRV station located at Chino Avenue and Haven Avenue is currently in the design phase and will also reduce pressure from the 1050 Zone to the 930 Zone.

4.3 PIPELINES

The pipelines operated and maintained by OMUC total approximately 172,684 LF. The pipelines range in size from 6-inch to 36-inch and consist primarily of PVC and CML&C materials. A summary of the length of pipe by diameter and material is shown in Table 4-2.

Table 4-2 Recycled Water Pipeline Inventory

Pipe Size	Pipe Material	Total Length of Pipe (lf)
6-inch	PVC	339
8-inch	CML&C[1]	531
	PVC	108,386
12-inch	CML&C	199
	DIP	225
	PVC	40,409
16-inch	CML&C	23
	PVC	9,120
20-inch	CML&C	474
24-inch	CML&C	12,619
30-inch	CML&C	155
36-inch	CML&C	204
	Total Length	**172,684**

[1] 8-inch CML&C also includes 327 LF of Cement Mortar Lined and Welded Steel pipe.

As illustrated in the chart below, approximately 63-percent of the OMUC pipelines are 8-inch PVC, and 23-percent are 12-inch PVC.

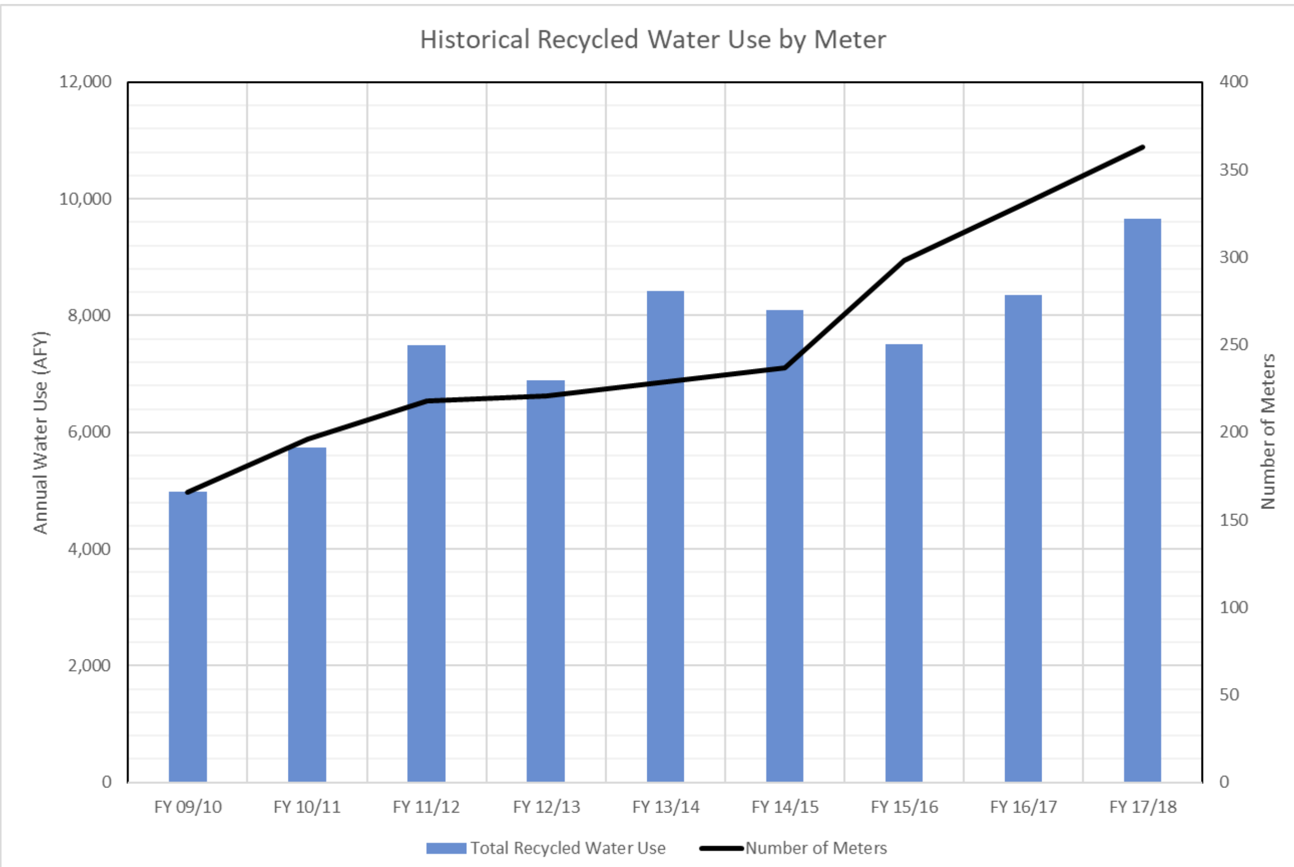
Ontario Recycled Water Master Plan

Figure 4-1 Existing Recycled Water System Conveyance Facilities

5.0 RECYCLED WATER DEMANDS

5.1 HISTORICAL RECYCLED WATER USE

The total amount of recycled water usage has been increasing since 2009 due to the increasing number of recycled water meters/users. In 2009, only 166 meters were active. As of 2018, there are 363 active recycled water meters. The chart below illustrates the growth in recycled water use and increase number of recycled water meters since 2009.



For this Master Plan and hydraulic analysis, the data from July 2017 through June 2018 will be utilized. The billing data from years 2009 through 2018 are summarized in Table 5-1.

Table 5-1 Historical Recycled Water Usage (AF)

Based on 363 active RW water meters' billing data provided by the City, the total recycled water usage from July 2017 to June 2018 was 9,653 ac-ft.

The recycled water usage subtotaled by existing land use is shown in Table 5-2.

5.2 RECYCLED WATER DEMAND FACTORS

The recycled water demand factors are based on the recycled water meter billing data. In GIS the meters were assigned a parcel(s) based on the address and location information provided by the City. The meter data for each land use was then grouped and divided by the total area for each land use. This process also consisted of verifying that each land use and the service area of the meter (based on the land use from the GIS parcel base) is consistent with the actual land use (using aerial imagery).

The recycled water irrigation demand factors are shown in the following table.

Table 5-3 Recycled Water Irrigation Unit Demand Factors

General Land Use Category	Land Use	Abbr.	Demand Factors (Gal/AC/Day)
Residential	Rural Density Residential	RR	-

[1] Demand for LMDR is average of LDR and MDR.

5.3 RECYCLED WATER PEAKING FACTORS

In determining the peaking factors for this study, the monthly demands for FY 2017/2018 were used as shown below. Historically, the month of September represents the maximum monthly recycled water usage.

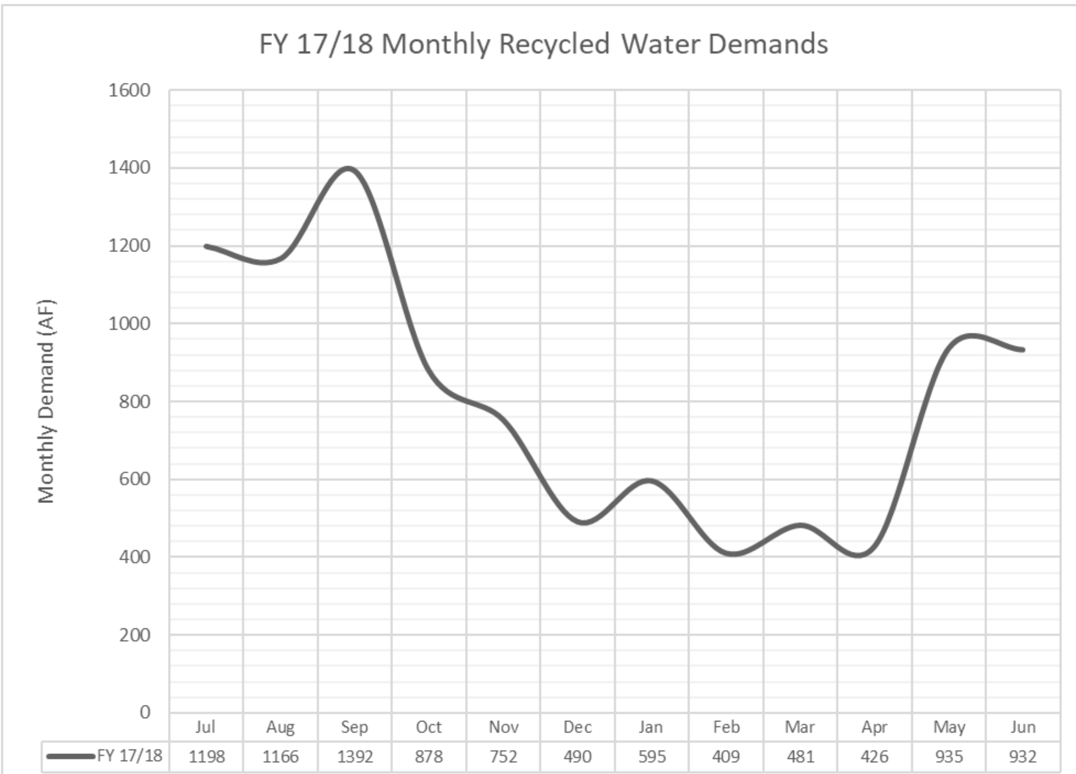

Table 5-4 has been prepared to summarize the water usage for FY 2017/2018.

Table 5-4 Recycled Water Demand Factors

Demand Condition	Recycled Water Demand[1]	Demand Factor
Annual Average	9,653 AFY	-
Average Day (ADD)	8.46 mgd	-
Maximum Month	14.63 mgd	1.73 x ADD
Estimated Maximum Day (MDD)	16.82 mgd / 11,684 gpm	2.00 x ADD
Estimated Peak Hour (PH)	20,358 gpm	3.54 x ADD

[1] Recycled Water Demand is based on the FY 17/18 data.

5.4 RECYCLED WATER DIURNAL DEMAND PATTERNS

The demand patterns previously developed for the City's ultimate water demand estimate are used for this Master Plan Update. There are four primary diurnals used for the OMUC service meters including landscape irrigation, industrial, industrial manufacturing, and agricultural uses. Each of these diurnals are shown below. A composite diurnal has also been prepared that combines these four land use diurnals based on a weighted average of demand contribution to show a systematic diurnal and system peak hour factor.

6.0 DESIGN CRITERIA

6.1 SYSTEM ANALYSIS CRITERIA

The model will be established based on the following set of design and planning criteria:

- Minimum regional service pressure = 50 psi
- Maximum regional system pressure = 150 psi
- Maximum flow rate < 8 ft/s
- Minimum flow rate > 1 ft/s

6.2 FACILITY DESIGN CRITERIA

The design and construction of any RW facilities should follow the *Water & Sewer Construction Specification*, and the *Water & Sewer Design Guidelines and Specification* provided by the City. The beneficial uses of recycled water include but are not limited to, landscape irrigation systems, agricultural irrigation systems, and industrial process uses. Systems used for industrial processes, construction purposes, or recreational impoundment shall be reviewed by the City. The determination of whether the City supplies recycled water or potable water will be in accordance with the standards of treatment and water quality requirements set forth in Title 22, Chapter 4 of the California Administrative Code.

6.2.1 Pipe Sizing and Configuration

The tertiary treated recycled water lines shall be constructed in accordance with the color-coding and labeling requirements. All pipeline material used in the recycled water system shall be purple in color or installed with a purple polyethylene sleeve at the time of installation. Separation between water, sewer, and recycled water line installations shall be in accordance with Department of Public Health regulations, or City requirements, whichever is greater.

The standard recycled water mainline sizes allowed in the City are 8-inch, 12-inch, 16-inch, 20-inch, 24-inch, 30-inch, and 36-inch in diameter. For recycled water, the minimum pipeline size in arterial streets of a new development area is 8-inch diameter. Smaller diameter pipelines will be considered in collector streets on a case-by-case basis by the City. Recycled water facilities shall typically be located 8-feet from the curb face on the opposite side of the street as the potable water. Each line shall be valved so that any segment does not exceed 2000 feet. Dead end mains shall be provided with means of flushing with a blow-off. Pipelines 8-inches and smaller shall be installed with a minimum of 54-inches of cover between the top of the pipe and the finished grade. Pipelines 12-inches or greater shall be installed with a minimum of 60-inches from the top of the pipe to the finished grade. Recycled water pipes shall be installed at a depth greater than the potable waterlines.

6.2.2 Pressure Reducing Station Requirements

Where required by the City, pressure reducing stations shall be individually designed specifically for each installation, subject to City review and approval of design and materials. All services shall be constructed in accordance with the applicable City Standard Drawings. Services shall not be connected to 18-inch or larger mains unless specifically permitted by the City.

7.0 EXISTING SYSTEM HYDRAULIC MODEL ANALYSIS

7.1 HYDRAULIC MODEL

The hydraulic model used for this Master Plan is the IEUA hydraulic model used for IEUA's Recycled Water Program Strategy. This hydraulic model contains the IEUA supplies for existing and future conditions, including the other Member Agencies connections and recycled water demands purchased from IEUA. This hydraulic model is therefore considered to accurately reflect regional supply and hydraulic conditions that impact the City of Ontario's recycled water system.

The hydraulic model is created in InfoWater, with the InfoWater Suite 12.4 utilized for this Master Plan analysis. Since the hydraulic model included all IEUA supply facilities, pump stations, regional pipelines, and recycled water demands, including the groundwater recharge basin flows, updating the model was required only for the existing Ontario pipelines and demands. The model was then updated to create the Near-Term and Future demand scenarios required for this study.

The recycled water model was updated to include the most recent City of Ontario recycled water demands, as described in Chapter 5 based on the 2017/2018 billing data. Pipelines and demand locations that represent existing meter locations were updated into the model based on the latest GIS database information that was provided by the City.

The hydraulic model includes data sets and diurnal demand patterns to analyze the system for a 24-hour extended period simulation (EPS).

7.2 MAXIMUM DAY DEMAND HYDRAULIC ANALYSIS

An analysis for the existing maximum day demands was conducted as a baseline scenario for this master plan. The maximum day demands were input at each demand location in the model. The hourly diurnal pattern was then applied to the demands. The total maximum day demand for the existing recycled water system within the City is 16.83 MGD. The maximum day demand by pressure zone is shown in Table 7-1 below.

Table 7-1 Existing Maximum Day Demands by Pressure Zone

Pressure Zone	Maximum Daily Demand (MGD)	Maximum Day Flow Rate (gpm)
930	8.82	6,124
1050	1.36	942
1158	2.75	1,910
1299	3.90	2,708
Total	16.83	11,684

The hydraulic modeling results show that the existing IEUA regional system meets the design criteria for both pressure and pipeline velocities throughout the IEUA regional system. There are a few known low pressure areas, such as at the 7th/8th Street Basins in 1299 Zone and in the 42-inch transmission main of the 1158 Zone near RP-4.

There are a few demand nodes with pressures below the criteria in the western portion of the 1299 Zone within the City of Ontario's distribution system. These pressures are predicted by the model to be as low as between 35-48 psi between 5th Street and 6th Street from Elderberry Avenue to Mountain Avenue. The low pressures in this area are due to high ground elevations for the 1299 Zone. The pipeline velocities and supply sources for the pressure are within design criteria. The nodes with low pressures are indicated in red in the graphic below. To mitigate the low service pressures in this area, an irrigation pump at the meter is recommended.

All other demand locations within the City have pressures above 50 psi and pipeline velocities less than maximum criteria. There are no deficiencies for existing demand conditions based on the hydraulic model.

8.0 RECYCLED WATER USE PROJECTIONS

8.1 OVERVIEW OF DEMAND CATEGORIES

The projected future demands are determined for five main types of demand categories:

1) existing users (as described in Chapter 5),

2) vacant land areas to developed,

3) existing agricultural land to be developed,

4) existing agricultural land that can be converted in the interim before being developed, and

5) existing developed land with potable water irrigation meters that may be converted to the recycled water system, or potential conversion areas.

The land uses are determined by acreage for each land use type or category. The areas that are currently vacant or agricultural uses that are proposed to be developed are determined according to the City of Ontario's General Plan, and in conjunction with other planning studies such as the Mixed-Use Area Plans and developments for the Ontario Ranch area. The following sections described in more detail the demand categories evaluated, with the exception of the existing users since they are already discussed in Chapter 5 of this report.

8.2 VACANT LAND TO BE DEVELOPED

The vacant land use parcels in the existing land use database were evaluated by overlaying the parcel database on Google Earth aerial photogrammetry. By inspection, the vacant parcels were verified if there was an actual use or occupancy or if the parcel was indeed vacant. The remaining existing vacant land use parcels that were then overlaid with the General Plan land uses to determine which currently vacant land use parcels will be developed, with the General Plan land use designation. The results of this analysis are shown in Table 8-1. These parcels are also graphically illustrated in Figure 8-1. As shown, there are a significant number of parcels in the Original Model Colony and Ontario Ranch service areas.

Total City of Ontario			**1,199**	**1,641**

Note: Vacant parcels located within Euclid Area are categorized to Euclid Ave conversion areas shown in Table 8-3.

8.3 EXISTING AGRICULTURE LAND TO BE DEVELOPED

The agriculture land uses in the City are entirely within the Ontario Ranch service area. Based on the General Plan these parcels currently are identified as agricultural uses that will be developed, and largely become either residential, industrial or business park type of land use. Some of the agricultural area has already been developed, with large portions that are now projects in the design or late planning stages.

Table 8-2 provides a summary list of the projected recycled water demand for these agricultural development parcels within the Ontario Ranch service area.

Table 8-2 Agricultural Land to be Developed Recycled Water Use

Service Area	Future Land Use for the Existing Vacant Parcels	General Plan Land Use Designation	Total Gross Acreage (acres)	Future Recycled Water Use (AFY)

	Public	PF	-	-
		PS	101	254
		ARPT	-	-
		Rail	-	-
		ROW	110	74
		LF	-	-
	Mixed Use	MU	515	865
		Total City of Ontario	**5,531**	**5,807**

It should be noted that the current demand for these parcels is approximately 4,940 AFY. Despite the large acreage of development, the overall future recycled water use is not expected to increase greatly, at approximately 5,807 AFY.

Agricultural land that has a potential to be converted to recycled water in the interim before the land is developed is considered separately in Section 8.5.1 and shown in Table 8-4.

8.4 CONVERSION AREAS

Conversion areas are defined as parcels that are currently serviced by the potable water system to supply a separate irrigation meter to the parcel and that has a potential to be converted to the recycled water system. An analysis was conducted on the historical billing data for these potable irrigation meters based on the largest water users. The results of this analysis identified approximately 3,422 acres with a total current potable water irrigation demand of 4,906 AFY. Parcels considered most viable for conversion to the recycled water system are parks, schools, and parcels adjacent to or within close proximity to an existing or proposed recycled water pipeline. Therefore, not all parcels with potable irrigation meters are included with the conversion areas as a result. The parcels with a priority and proposed for conversion to the recycled water system are listed and subtotaled by land use.

In addition, there are two conversion areas that have been previously identified and studied, and which are included in this analysis. These areas are known as the Euclid Avenue and Creekside conversion areas. Planning studies and design drawings have been prepared for some facilities within these areas. Therefore, these two conversion areas are identified and subtotaled separately from the potable irrigation meters.

Ontario Recycled Water Master Plan
Figure 8-1 Potential Recycled Water Customers

8.5 PHASING

For planning purposes for the recycled water system, there are two primary phases for the expansion of recycled water in the City of Ontario; a Near-Term phase, and the Future phase, as described in the following sections below.

8.5.1 Near-Term Phase

The Near-Term phase is assumed to include potential system requirements to support development for approximately the next 5-years. The Near-Term phase is assumed to consist of the following areas:

- Current Developments in the Ontario Ranch service area – These developments are currently in the planning phase or design phase that are expected to begin in approximately 5-years.
- Creekside conversion project areas – These areas have already been previously studied and proposed for conversion to recycled water, and design plans have been prepared many of the facilities to serve the areas.
- Some large irrigation meters/users that can be converted to recycled water – These parcels are assumed to be converted in the near future since they are in the vicinity of existing facilities or could be connected to a pipeline that is already proposed to be constructed.
- Parks and Schools that can be converted – These parcels have a high priority for the City where it is practical. These parcels are assumed to be converted in the near future since they are in the vicinity of existing facilities or could be connected to a pipeline that is already proposed to be constructed.
- Some agriculture land that can be converted to recycled water before it is ultimately developed – The temporary agricultural use parcels that are adjacent to an existing pipeline or a pipeline that is to be constructed within the Near-Term planning horizon are assumed to be converted to the recycled water system. For purposes of this study, the majority of these parcels are located along Haven Avenue and Eucalyptus Avenue in the East Ontario Ranch areas. Parcels are also assumed to be temporarily connected along the IEUA 30-inch pipeline in Edison Avenue.

Table 8-4 below provides the summary of the projected demands for this Near-Term Phase subtotaled by land use and service area. Table 8-4 summarizes the recycled water demands by type of area as listed above.

8.5.2 Future

The Future phase consists of all remaining areas proposed to be converted or connected to the recycled water system after the Near-Term phase areas are completed. Land uses are based on the current General Plan. The Future phase areas consists of the following areas:

- All Developments in the Ontario Ranch service area – This includes the Mixed-Use areas as described in the General Plan
- Euclid Avenue conversion project areas – These areas have already been previously studied and proposed for conversion to recycled water, and design plans have been prepared many of the facilities to serve the areas.
- Parks and Schools that can be converted
- All Agricultural land to be developed
- All large potable irrigation meters/users that can converted to recycled water

Table 8-5 provides a summary of the projected recycled water demands for the Future phase.

Figure 8-2 illustrates the near term and future potential customers by phase. Figure 8-3 shows a summary of all the potential recycled water customers by phase with potential piping needs.

Ontario Recycled Water Master Plan

Figure 8-3 Summary of Potential RW Customers & Phasing

9.0 FUTURE SYSTEM HYDRAULIC MODEL ANALYSIS

9.1 NEAR TERM HYDRAULIC MODEL ANALYSIS

The hydraulic model was updated to include the Near-Term Phase, which is assumed to occur within the next 5-years. This phase includes current developments in the Ontario Ranch service area, and portions of the previously planned Creekside conversion project areas. Some agriculture land adjacent to pipelines to be proposed that can be converted to recycled water before it is ultimately developed is also included in this phase for the Ontario Ranch area. Table 9-1 below provides a summary of the demands analyzed in the hydraulic model for each pressure zone.

Table 9-1 Near Term Phase Maximum Day Demands by Pressure Zone

Pressure Zone	Maximum Daily Demand (MGD)	Maximum Day Flow Rate (gpm)
930	9.67	6,715
1050	5.39	3,740
1158	2.64	1,910
1299	4.05	2,813
Total	21.75	15,178

The Near-Term phase is predominantly expansions within the 930 and 1050 Zones due to the Ontario Ranch developments and conversion of the existing Creekside area east of Turner Avenue. Additionally, there are some recycled water customers proposed to be converted to the 1299 Zone system that will require minimal piping construction. Most of the parcels to be converted in the 1299 Zone are near or adjacent to existing pipeline facilities.

930 Zone Pressure Reducing Stations

This zone is supplied primarily from the RP-1 and CCWRF treatment facilities and effluent pump stations from IEUA. To supplement the eastern portion of the 930 Zone, the City also has an existing pressure reducing station to feed the 930 Zone from the 1050 Zone located at Chino Avenue and Archibald Avenue. The City is also constructing a new pressure reducing station from the 1050 Zone to the 930 Zone at Chino Avenue and Haven Avenue. The following are the modeled pressure set points and resulting peak flow through the pressure reducing valve from the hydraulic model analysis.

Table 9-2 930 Zone Pressure Reducing Stations – Near Term

Pressure Reducing Station	Location	Modeled Downstream Setpoint	Modeled Peak Flow Rate
PR-1	Chino & Archibald	70	2,830 gpm
PR-2	Chino & Haven	55	802 gpm

The hydraulic modeling results show that the existing IEUA system meets the design criteria for both pressure and pipeline velocities throughout the IEUA regional system. There are a few known low pressure areas of the IEUA system, such as at the 7th/8th Street Basins in the 1299 Zone and in the northern area of the 42-inch transmission main of the 1158 Zone near RP-4.

The Near-Term model analysis shows that for the City's distribution system no additional locations with demands results pressures below the criteria than was seen for the Existing system analysis. The demand nodes with pressure below the criteria are located in the western portion of the 1299 Zone. These pressures are predicted by the model to be as low as between 35-48 psi between 5th Street and 6th Street from Elderberry Avenue to Mountain Avenue. The low pressures in this area are due to high ground elevations for the 1299 Zone. The pipeline velocities and supply sources for the pressure are within design criteria. The nodes with low pressures are indicated in red in the graphic below. Similar to the Existing system analysis, to mitigate the low service pressures an irrigation pump at the meter is recommended for this area.

All other demand locations within the City have pressures above 50 psi and pipeline velocities less than the maximum criteria.

Figure 9-1 and 9-2 illustrate the proposed Near-Term phase and proposed piping.

Figure 9-2 Proposed Near Term Improvements

9.2 FUTURE HYDRAULIC MODEL ANALYSIS

The future phase areas consist of the following areas: all developments in the Ontario Ranch service area, parks and schools that can be converted, all agricultural land to be developed, and some large potable irrigation meters/users that can be converted to recycled water. Table 9-3 shows the maximum day demands for each pressure zone that were analyzed in the hydraulic model.

Table 9-3 Future Phase Maximum Day Demands by Pressure Zone

Pressure Zone	Maximum Daily Demand (MGD)	Maximum Day Flow Rate (gpm)
930	10.91	7,580
1050	3.02	2,202
1158	9.22	6,962
1299	4.55	3,156
Total	**27.70**	**19,900**

9.2.1 Future Regional 1158/1299 Zone IEUA Improvements

The Future phase for this study assumes that the proposed IEUA 1158/1299 Zone regional pipeline improvements, including the 1158 Zone storage tank and 1158 to 1299 Pump Station, as shown in the IEUA Recycled Water Program Strategy, are not constructed. The timing and reliance of these regional improvements are not certain, and therefore, the future planning horizon for this study assumes these IEUA regional facilities are not yet constructed.

9.2.2 Future 930 Zone Analysis

The 930 Zone Future phase assumes the Ontario Ranch development areas are built-out. The recycled water demands are primarily landscape irrigation with no agricultural uses. IEUA supply facilities from RP-1 and CCWRF are supplemented by the two City PRV stations located in Chino Avenue, as shown in Table 9-4 below.

Table 9-4 930 Zone Pressure Reducing Stations – Future

Pressure Reducing Station	Location	Modeled Downstream Setpoint	Modeled Peak Flow Rate
PR-1	Chino & Archibald	70	8,725 gpm
PR-2	Chino & Haven	55	885 gpm

9.2.3 Future 1050 Zone Analysis

The 1050 Zone Future expansion areas are west of South Vineyard Avenue, as shown in Figure 9-3. The demands for the 1050 Zone portion of the West Ontario Ranch will be met by new 8-inch, 12-inch, and

16-inch pipelines in Riverside Drive, and a new 8-inch pipeline in Chino Avenue. A new 16-inch diameter pipeline is proposed in Philadelphia and Bon View Avenue to support the proposed 1050 to 1158 Pump Station to serve the western portion of the 1158 Zone.

9.2.4 Future 1158 Zone Analysis

The Future 1158 Zone is proposed to be divided into two hydraulically separate pressure zones, the West 1158 Zone and the East 1158 Zone. The East 1158 Zone will be supplied by the IEUA RP-1 and RP-4 1158 Zone Effluent Pump Stations and 1158 Zone Storage Tank. The future pipeline expansion areas for the East 1158 Zone will be served by the existing IEUA 36-inch and 42-inch diameter pipelines, as shown in Figure 9-4.

The West 1158 Zone will be a closed-loop zone supplied by the proposed 1050 to 1158 Pump Station to be located at the southeast intersection of Bon View Avenue and Francis Street. A 16-inch diameter pipeline will then be routed from this pump station within Francis Street westerly to the intersection of Francis and Euclid Avenue. The proposed pump station is assumed to require VFD motors and equipped with three pumps: two-duty pumps and one-standby pump. The hydraulic parameters are described in Table 9-5 below.

Table 9-5 Future 1050 to West 1158 Zone Pump Station

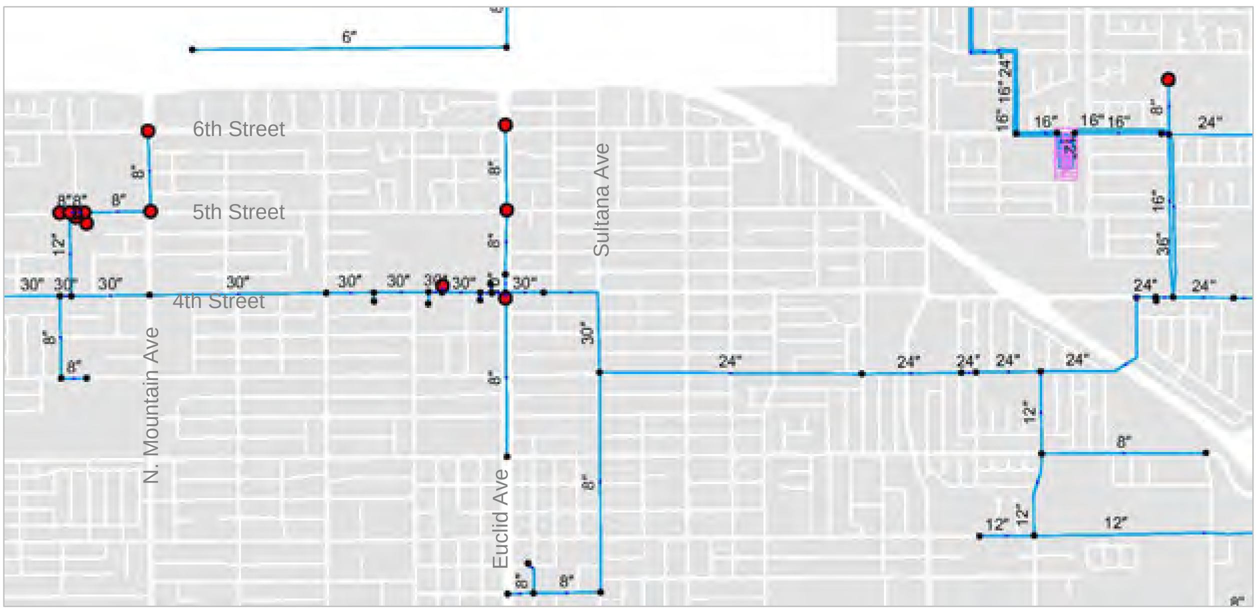
Description	Design Parameter
No. Pumps	2-Duty 1-Standby
Suction Pressure	70-75 psi
Discharge Pressure	118-126 psi
Peak Flowrate	1323 gpm
TDH (1)	115-ft
Approx. Motor HP-each	50 Hp

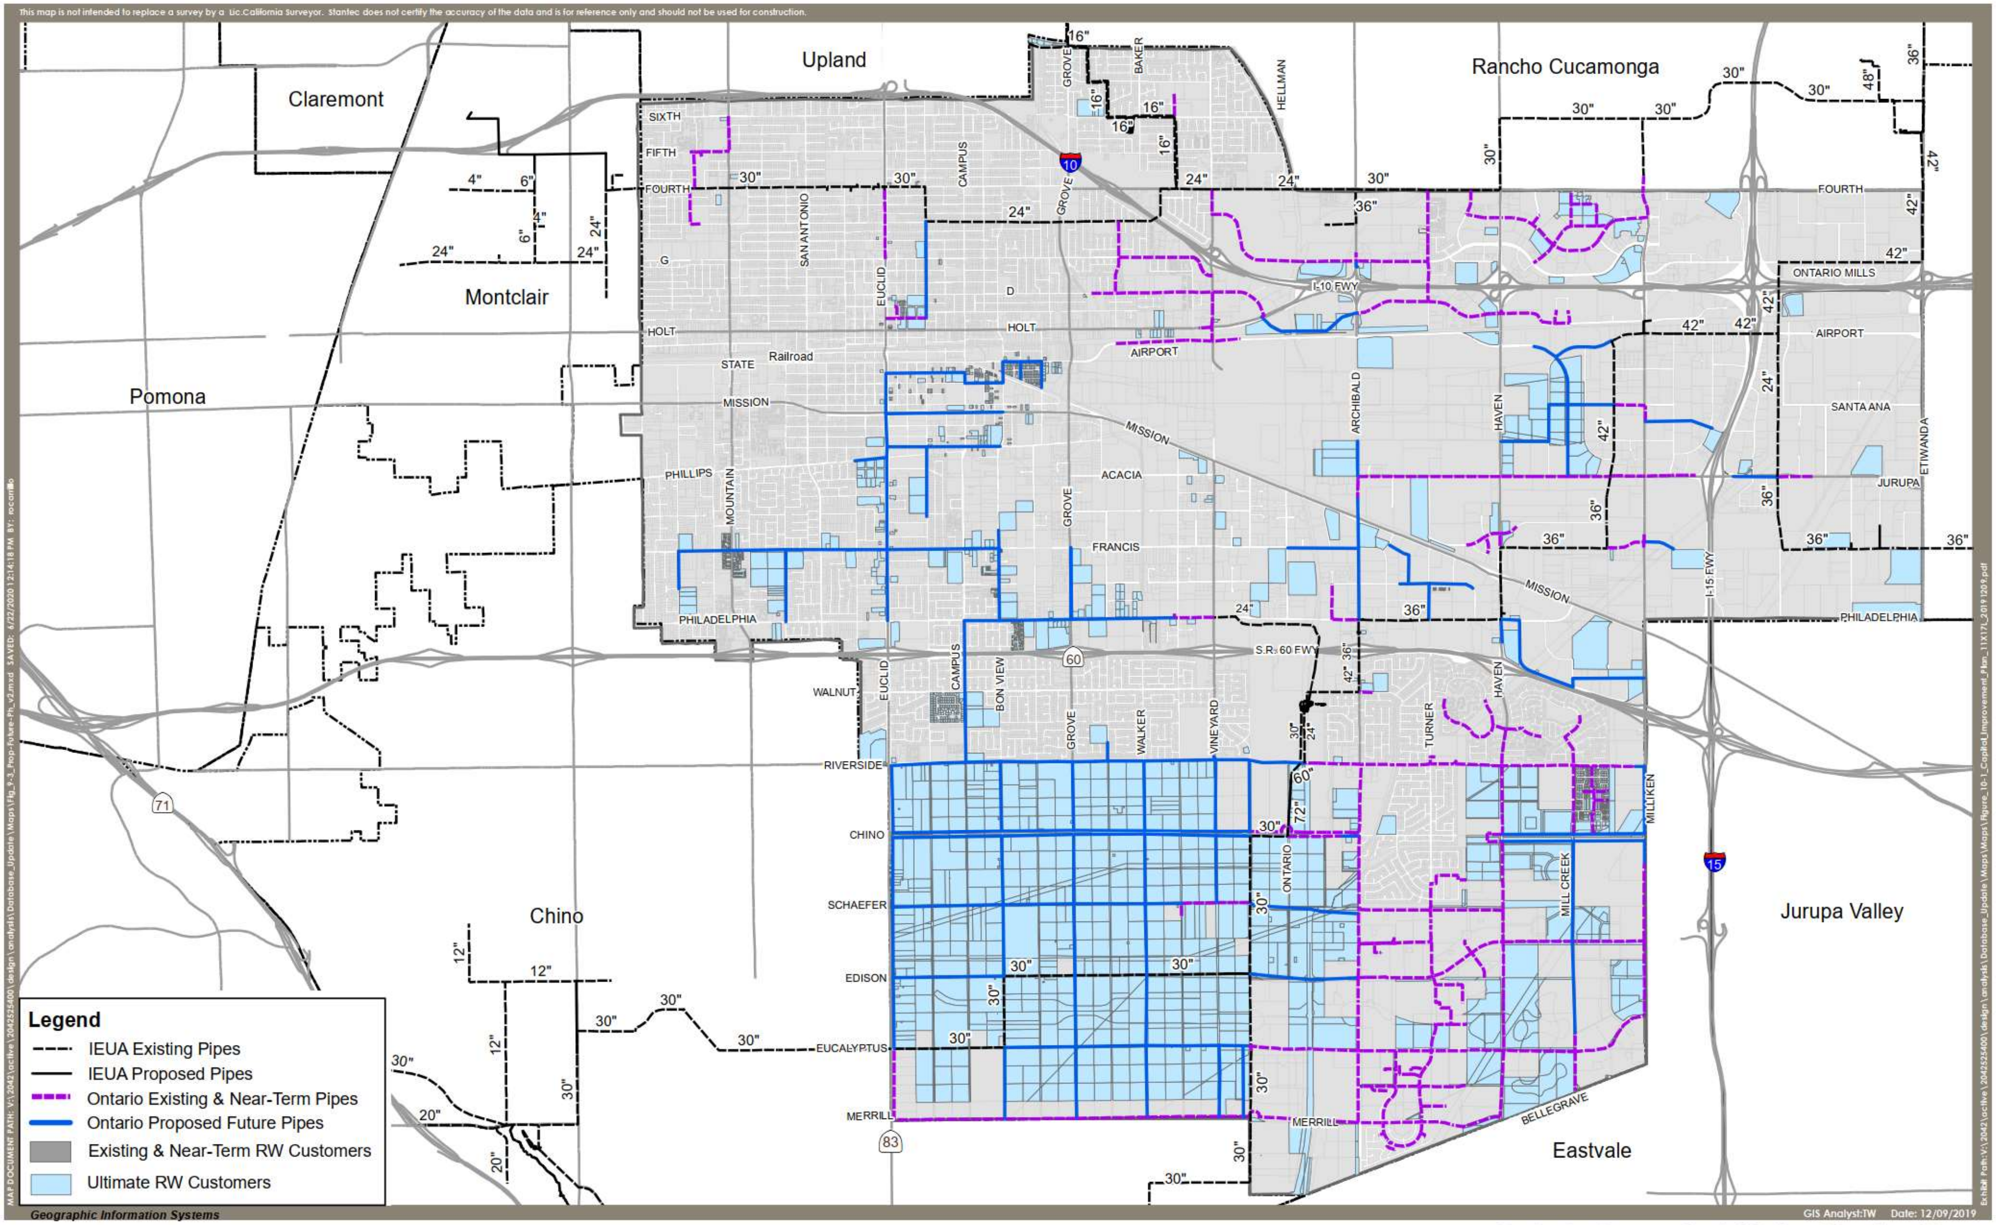
(1) TDH does not include internal pump station minor losses.

9.2.5 Future 1299 Zone Analysis

Within the City's distribution system, there are a few additional low-pressure demand locations in the western portion of the 1299 Zone than resulted from the Existing and Near-Term conditions analyses. These additional locations of pressures below the criteria are predicted by the model to be as low as between 35-48 psi north of 5th Street. Pressures that are only slightly below 50 psi along 4th Street are located on the City's laterals and are approximately 48-50 psi. The low pressures in this area are due to high ground elevations for the 1299 Zone. The pipeline velocities and supply sources for the pressure are within design criteria. The nodes with low pressures are indicated in red in the graphic below. To mitigate the low service pressures for these areas, an irrigation meter at the pump station is recommended.

Like the Existing and Near-Term analyses, demand nodes with pressure below the criteria are in the western portion of the 1299 Zone. These pressures are predicted by the model to be as low as between 35-48 psi between 5th Street and 6th Street from Elderberry Avenue to Mountain Avenue. The low pressures in this area are due to high ground elevations for the 1299 Zone. The pipeline velocities and supply sources for the pressure are within design criteria. The nodes with low pressures are indicated in red in the graphic below. Similar to the previous analyses, to mitigate the low service pressures an irrigation pump at the meter is recommended for this area.





Ontario Recycled Water Master Plan
Figure 9-5 Future Recycled Water System

9.3 STORAGE ANALYSIS

An investigation was performed to evaluate the potential need for future storage facilities to support the City's recycled water distribution system. Storage considerations were performed for only the Future system conditions and in addition to what is contained in the IEUA Recycled Water Program Strategy. Storage tanks are provided within IEUA's regional supply system that contain adequate storage for the direct recycled water use demands for each of the pressure zones. The hydraulic model analysis confirms that the future IEUA supply pumps and existing storage tanks have capacity for the projected maximum day demands proposed by this study.

The areas for any opportunity for storage would be the western portion of the 1299 and 1158 Zones. A storage tank in this area of the City may allow for increased demands in the system beyond what is projected by this Master Plan. A review of the potential for a storage tank to support the 1299 Zone shows that this would not be a feasible opportunity. The hydraulic model shows a storage tank located in the western portion of the 1299 Zone would not cycle appropriately and increase water quality concerns. In addition, a location would need to be located outside the City limits. Upon cursory review of the elevation contours required there is no suitable location for a new storage tank.

Storage tank locations for the 1158 and 1050 Zones would need to be far north from the existing and proposed pressure zone distribution systems requiring several miles of pipeline. Additionally, no suitable locations for storage tanks are available. The projected demands in these western areas have been planned so that the IEUA distribution system will be kept to a minimum of 50 psi without additional storage facilities.

9.4 COMPARISON TO 2012 RWMP

Some recommendations discussed in this report may differ from the 2012 RWMP. Table 9-6 compares the differences between the former and current RWMP and the reason for the updated recommendation.

Table 9-6 Comparison to 2012 RWMP

Description	Reasoning
Chino Ave between Archibald Ave and Haven Ave main removed for both Zone 930 and 1050	No RW demands along Chino Ave, Peak demand capacity to 930 Zone conveyed through PRV at Chino/Haven
Chino Ave between Haven Ave and Mill Creek Ave downsized to a 16-inch from a 20/24-inch main	Peak flow reduced due to less system demand and lower peaking factor
Chino Ave between Mill Creek Ave and Hamner Ave upsized to a 16-inch from a 12-inch main	To minimize headloss for system pressures above criteria
Merrill Ave between Baker Ave and Vineyard Ave downsized to an 8-inch from a 12-inch main	Peak flow reduced due to less system demand and lower peaking factor
Merrill Ave between Vineyard Ave and Carpenter Ave upsized to a 16-inch from a 12-inch main	Upsized to maintain pipe within velocity criteria due to peak flows in the area
Eucalyptus Ave between Baker Ave and Vineyard Ave upsized to a 12-inch from an 8-inch main	Upsized to maintain pipe within velocity criteria due to peak flows in the area
Euclid Ave OMC projects added	n/a

10.0 CAPITAL IMPROVEMENT PLAN

The proposed Capital Improvement Plan (CIP) assumes that the proposed improvements as described in Chapter 9, and shown in Figure 9-5, will be constructed in two primary phases: Near-Term and Future. The Near-Term phase assumes recycled water distribution system expansion through the next 5-years, to approximately Year 2025. The Future phase will be expansion projects to occur after Year 2025 and include the build-out of the Ontario Ranch developments and all potential conversion areas as described in this Recycled Water Master Plan.

10.1 NEAR-TERM

The Near-Term improvements and costs by pressure zone are shown in Table 10-1 below. For the Near-Term improvements, a total of 51,960 LF (9.84 miles) of pipeline is proposed ranging from 8-inch to 30-inch diameter pipe, including the proposed PRV station at Chino Avenue and Haven Avenue. The total Project CIP Costs include administrative, engineering and contingency costs at 35-percent of the construction cost estimates.

Table 10-1 Near-Term CIP Costs

10.2 FUTURE PHASE

The Future phase improvements and costs by pressure zone are shown in Table 10-2. For the Future improvements, a total of 275,564 LF (52.19 miles) of pipeline is proposed ranging from 8-inch to 24-inch diameter pipe. The improvements listed for this phase are in addition to the improvement projects identified for the near-term phase improvements. Also, the proposed 1050 to 1158 Pump Station is included in the cost table. The total Project CIP Costs include administrative, engineering and contingency costs at 35-percent of the construction costs estimates.

Table 10-2 Future CIP Costs

Ontario Recycled Water Master Plan

Figure 10-1 Capital Improvement Plan

11.0 REFERENCES

Previous studies for the recycled water system are:

- Ontario Recycled Water Pipeline Project: *Pipeline Sizing Memo* by Michael Baker, July 2016
- Ultimate City-Wide Water Demand Estimate Memo by AKM, May 2016
- Inland Empire Utilities Agency (IEUA) Recycled Water Program Strategy (RWPS), October 2015
- Study of Recycled Water Pressure Zone 930 (Elimination of pipe in Chino Ave) by AKM, April 2014
- City of Ontario Recycled Water Master Plan, April 2012

Reference documents for this report are as follows.

- The Ontario Plan (General Plan), February 2010
- California Code of Regulations Title 14 and Title 17

InfoWater 12.4 is used to conduct the analysis. Data sources are shown below.

- Existing Recycled Water Customer Billing Data from 2009 to 2018.
- Demand Factors and Demand Pattern from Ultimate City-Wide Water Demand Estimate Memo (AKM, May 2016) and IEUA Recycled Water Program Strategy, October 2015.
- GIS data provided by the City of Ontario:
    - Land use data received on October 31, 2018.
    - Recycled water system data received on October 31st, 2018, which included recycled water mains, laterals, system valves, hydrants, meters, active recycled water meters with customer data, geocode points locations of active meters, parcel data, and street centerlines.
    - Recycled water meter locations, received on November 1, 2018.

LIST OF ABBREVIATIONS

Abbreviation	Terms
Units of Measurement	
AF	Acre-Feet
AFY	Acre-feet per Year
TAF	Thousand Acre-Feet
MAF	Million Acre-Feet
cfs	Cubic feet per second
GPCD	Gallons per Capita per Day
MGD	Million gallons per Day
mg/L	Milligrams per liter
MW	Megawatts
µg/L	Micrograms per liter
ng/L	Nanograms per liter
pCi/L	Picocuries per liter
kWh	Kilo-Watt Hour
Acronyms	
AGWA	Association of Ground Water Agencies
AMPAC	American Pacific Corporation
AVEK	Antelope Valley East Kern Water Agency
AWE	Alliance for Water Efficiency
AWWA	American Water Works Association
BDCP	Bay Delta Conservation Plan
BMPs	Best Management Practices
CAP	Climate Action Plan
CAWCD	Central Arizona Water Conservation District
CBM	Condition-based maintenance
CCL3	Contaminant Candidate List 3
CCP	Conservation Credits Program
CCWD	Contra Costa Water District
CDFW	California Department of Fish and Wildlife
CEC	California Energy Commission
CECs	Constituents of Emerging Concern
CEQA	California Environmental Quality Act
CII	Commercial, Industrial, and Institutional
CMMS	Computerized Maintenance Management System
CO_2	Carbon Dioxide
CPE	Comprehensive Program Evaluation
CRA	Colorado River Aqueduct
CRSS	Colorado River Simulation System
CUWCC	California Urban Water Conservation Council
CVP	Central Valley Project
CVWD	Coachella Valley Water District
CWC	California Water Code
CWSRF	Clean Water State Revolving Fund
CY	Calendar Year
DAC	Disadvantaged Community

LIST OF ABBREVIATIONS

Abbreviation	Terms
D/DBP	Disinfectants/Disinfection Byproduct
DBP	Disinfection Byproduct
DCP	Drought Contingency Plan
DDW	The SWRCB's Division of Drinking Water
DFW	Department of Fish and Wildlife
DLR	Detection Level for purposes of Reporting
DMM	Demand Management Measure
DOE	U.S. Department of Energy
DPC	Delta Protection Commission
DPR	Direct Potable Reuse
DRA	Drought Risk Assessment
DSOD	Division of Safety of Dams
DTSC	California Department of Toxic Substances Control
DVL	Diamond Valley Lake
DWA	Desert Water Agency
DWCV	Desert Water Agency/Coachella Valley Water District
DWR	California Department of Water Resources
ECLO	Existing Conveyance and Low Outflow
EDD	California Employment Development Department
EIR	Environmental Impact Report
EIS	Environmental Impact Statement
ELPH	Equivalent Level of Public Health Protection
ESA	Endangered Species Act
ESP	Energy Sustainability Plan
ET_o	Evapotranspiration
FSA	Future Supply Actions
FWUA	Friant Water Users Authority
FY	Fiscal Year
GHG	Greenhouse Gas Emissions
GRP	Groundwater Recovery Program
GWRS	Groundwater Replenishment System
HECW	High Efficiency Clothes Washer
HET	High Efficiency Toilet
HTC	Hyatt/Thermalito Complex
ICP	Innovative Conservation Program
ICS	Intentionally Created Surplus
IEUA	Inland Empire Utilities Agency
IID	Imperial Irrigation District
IPR	Indirect Potable Reuse
IRP	Integrated Water Resources Plan
IRPSIM	Integrated Water Resources Plan Simulation Model
JWPCP	Joint Water Pollution Control Plant
LAA	Los Angeles Aqueduct
LADWP	Los Angeles Department of Water and Power
LRP	Local Resources Program
M&I	Municipal & Industrial

LIST OF ABBREVIATIONS

Abbreviation	Terms
MCL	Maximum Contaminant Level
MFR	Multi-family Residential
MLPA	Marine Life Protected Area
MOU	Memorandum of Understanding
MWD	The Metropolitan Water District of Southern California
MWD-EDM	Metropolitan's Econometric Demand Model
MWDOC	Municipal Water District of Orange County
MWELO	Model Water Efficient Landscape Ordinance
MWQI	Municipal Water Quality Investigations
NASA	National Aeronautics and Space Administration
NDEP	Nevada Division of Environmental Protection
NDMA	N-nitrosodimethylamine
NEPA	National Environmental Policy Act
NERT	Nevada Environmental Response Trust
NMFS	National Marine Fisheries Services
OCWD	Orange County Water District
OEHHA	Office of Environmental Health Hazard Assessment
OMP&R	Operation, Maintenance, Power and Replacement
PFAS	Per- and polyfluoroalkyl substances
PFBS	Perfluorobutane sulfonic acid
PFOA	Perfluorooctanoic acid
PFOS	Perfluorooctanesulfonic acid
PG&E	Pacific Gas & Electric
PHG	Public Health Goal
polyDADMAC	polydiallyldimethylammonium chloride
PPCP	Pharmaceutical/Personal Care Product
PPRs	Present Perfected Rights
PVID	Palo Verde Irrigation District
QMCP	Quagga Mussel Control Program
QSA	Quantification Settlement Agreement
RDM	Robust Decision Making
RPAs	Reasonable and Prudent Alternatives
RRWP	Regional Recycled Water Program
RTP-12	2012-2035 Regional Transportation Plan/Sustainable Communities Strategy
RTS	Readiness-to-Serve Charge
RWA	Raw Water Augmentation
SAF	San Andreas Fault
SANDAG	San Diego Association of Governments
SAR	System Access Rate
SARI Line	Santa Ana Regional Interceptor Line
SB X7-7	Senate Bill X7-7, Water Conservation Act of 2009
SCAG	Southern California Association of Governments
SCWC	Southern California Water Coalition
SDCWA	San Diego County Water Authority
SDP	Seawater Desalination Program

LIST OF ABBREVIATIONS

Abbreviation	Terms
Series 13	SANDAG Series 13: 2050 Regional Growth Forecast
SFR	Single-Family Residential Model
SNMP	Salt and Nutrient Management Plan
SNWA	Southern Nevada Water Authority
SPR	System Power Rate
SRCSD	Sacramento Regional County Sanitation District
SRWSTF	Seismic Resilience Water Supply Task Force
SWC	State Water Contractors
SWP	State Water Project
SWRCB	State Water Resources Control Board
TDS	Total Dissolved Solids
TOC	Total Organic Carbon
TVMWD	Three Valleys Municipal Water District
UCMR2	Unregulated Contaminant Monitoring Regulation 2
USBR	U.S. Department of the Interior, Bureau of Reclamation
USEPA	U.S. Environmental Protection Agency
USFWS	U.S. Fish and Wildlife Services
UWMP	Urban Water Management Plan
VOC	Volatile Organic Compound
WIFIA	Water Infrastructure Finance and Innovation Act
WRD	Water Replenishment District of Southern California
WSAP	Water Supply Allocation Plan
WSCP	Water Shortage Contingency Plan
WSDM Plan	Water Surplus and Drought Management Plan
WSR	Water Stewardship Rate
WUCA	Water Utility Climate Alliance
WUE	Water Use Efficiency
YCWA	Yuba County Water Agency

Phrases

2015 IRP Update	2015 Integrated Water Resources Plan, Water Tomorrow
Act	Urban Water Management Planning Act
Annual Assessments	Annual Water Supply and Demand Assessment
Arvin-Edison	Arvin-Edison Water Storage District
Bank	Governor’s Water Bank
Bay-Delta	San Francisco Bay/Sacramento-San Joaquin Delta
California Plan	California’s Colorado River Water Use Plan
Conservancy	Sacramento-San Joaquin Delta Conservancy
Council	Delta Stewardship Council
Delta	Sacramento/San Joaquin River Delta
Forum	Colorado River Basin Salinity Control Forum
Kern Delta	Kern Delta Water District
Metropolitan	The Metropolitan Water District of Southern California
MWD Act	Metropolitan Water District Act
Plan	Urban Water Management Plan
Policy	State Recycled Water Policy

LIST OF ABBREVIATIONS

Abbreviation	Terms
Regional Board	Regional Water Quality Control Board
Sanitation Districts	Los Angeles County Sanitation Districts
Science Board	Delta Independent Science Board
Semitropic	Semitropic Water Storage District

Summary of Compliance

SB X7-7	
Water Code § 10608.36 – Assessment of Measures, Programs, and Policies	Assess present and proposed future measures, programs, and policies to help achieve water use reduction targets • Metropolitan's actions to help achieve the urban per capita water use reduction pursuant to the goals set forth in SB X7-7 are discussed in Sections 3.4, 3.5, and 3.7.
Agency Coordination	
Water Code § 10610.2(a)(4)	Water suppliers should collaborate closely with local land-use authorities to ensure water demand forecasts are consistent with current land-use planning. • See Sections 2 and 5 and Appendix 1.
Water Code § 10620(d)(2) – Develop Water Shortage Contingency Plan	Each urban water supplier shall develop its own water shortage contingency plan. • See Section 2.5 and Appendix 4.
Water Code § 10620(d)(3) – Coordination with Appropriate Agencies	Describe the coordination of the plan preparation. • See Section 5.
Water Code § 10620(f) – Describe Resource Maximization/Import Minimization Plan	Discuss how water management tools and options are used to maximize resources and minimize the need to import water. • Metropolitan's planning strategy within the IRP and adaptive implementation approach are discussed in Section 2 and provide an overview of the water management tools and options. See pages 2-2 through 2-6. • Further details are provided in Sections 1.4 (conservation and local resources, pages 1-25 through 1-27), 3.4 (demand management and conservation, pages 3-37 through 3-55), and 3.5 (recycling, groundwater recovery, and desalination, pages 3-56 through 3-78.)
Water Code § 10621(b) – City and County Notification and Participation	Notify any city or county within service area of Urban Water Management Plan (UWMP) review & revision at least 60 days before public hearing. May consult with and obtain comments from notified cities and counties. • Notification and participation are discussed in Section 5, pages 5-1 through 5-10, and Appendix 12, DWR Submittal Table 10-1.
Water Code § 10621(f) – Plan Submittal to Department of Water Resources (DWR)	Each urban water supplier shall update and submit its 2020 plan to the department by July 1, 2021 • Submission of the 2020 UWMP by the July 1, 2021 deadline is detailed in Section 5.
Contents of UWMP	
Water Code § 10630.5 – Simple Lay Description	Include a simple lay description of how much water the agency has on a reliable basis, how much it needs for the foreseeable future, the agency's strategy for meeting its water needs, the challenges the agency faces, and any other information necessary to provide a general understanding of the plan. • The Simple Lay Description is contained in the Executive Summary.

Summary of Compliance

Water Code § 10631(a) – Service Area Information	Describe service area of supplier • Service area is discussed in Section 1.2, pages 1-6 through 1-10 and shown in Figure 1-1. Include current and projected population • Population is discussed in Section 1.3 and shown in Table 1-1, Figure 1-2, and Figure 1-3. • Population analysis is discussed in Appendix 1, page A.1-5. Projections are on page A.1-10, Table A.1-2. • Current and projected population are shown in Appendix 12, DWR Submittal Table 3-1. Population projections must be based on data from state, regional or local service agency projections • See footnote Table A.1-2, page A.1-10. Describe climate characteristics that affect water management • See Section 1.3, pages l-14 through l-16, Figure 1-5, and Table 1-4, and Section 2.6, pages 2-43 through 2-48. Describe other social, economic, and demographic factors affecting water management • See Section 1.3, pages 1-12 through 1-14 and Appendix 1. Describe current and projected land uses within the existing or anticipated service area affecting the supplier's water management planning. Suppliers shall coordinate with local or regional land use authorities to determine the most appropriate land use information. • See methodologies and assumptions for developing projections of demand and water use in Section 2.2.
Water Code § 10631(b)(1-3) – Water Sources	Identify and quantify existing and planned water supply sources in 5-year increments to 20 years or as far as data is available • Current supplies and quantities are described in Section 1.4, pages 1-21 through 1-30. • Historic and current water supplies are described in Appendix 2. • Planned water supplies and quantities are discussed in Section 2, and details are provided in Appendix 3, and particularly in Table A.3-7, pages A.3-58 through A.3-70. • See Appendix 12, DWR Submittal Tables 6-8 and 6-9. Detailed discussion of anticipated supply availability under normal water year, single dry year, and droughts lasting at least 5 years, as well as more frequent and severe drought periods (as described in the drought risk assessment). For each water supply source, consider any information pertinent to the Section 10635 reliability analysis, including climate change. • See Section 2, Tables 2-4 through 2-7, pages 2-18 through 2-25. • See Section 2.2 (estimating demand on Metropolitan) page 2-9, • See Section 2.3 (water reliability assessment), pages 2-15 through 2-20, Section 2.4 (drought risk assessment), pages 2-21 through 2-25, Section 2.6 (other supply reliability risks), pages 2-43 through 2-48, and the discussions presented under the Colorado River and State Water Project (SWP), Sections 3.1 and 3.2. • See Section 3 and Appendices 3 and 5 • See Appendix 12, DWR Submittal Tables 7-1, 7-2, 7-3, 7-4, and 7-5.

	Describe the management of each supply source in correlation with the other supplies. • See Section 3 and Appendix 3. Describe the measures being taken to acquire and develop planned water supply sources. • See Section 3 and Appendix 3.
Water Code § 10631(b)(4) – If Groundwater Identified as Existing or Planned Source	Metropolitan does not supply groundwater. However, Metropolitan partners with various entities for groundwater storage and exchange programs. • See Sections 3.3, 3.5, and 3.6; Appendix 2 (pages A.2-4 through A.2-5, A.2-8 through A.2-9, A.2-15); and Appendix 3 (pages A.3-25 through A.3-28, A.3-31 through A.3-32, A.3-53 through A.3-55) for discussions of issues related to groundwater basins. • See Section 4 for salinity issues related to groundwater basins.
Water Code § 10631(c) – Transfer or Exchange Opportunities	Describe short-term and long-term exchange or transfer opportunities • Section 1.4 (augmenting water supplies), pages 1-27 through 1-28. • Section 3.1 (pages 3-3 through 3-12) describes plans for banking, exchange and transfer opportunities along the Colorado River and Aqueduct. • Section 3.2 (pages 3-13 through 3-30) describes plans for banking, exchange and transfer opportunities within the State Water Project. • Section 3.3 (pages 3-31 through 3-36) describes plans for banking, exchange and transfer opportunities within the Central Valley/State Water Project. • Section 3.6 (pages 3-79 through 3-82) describes plans for banking, exchange and transfer opportunities within the local region. • Further details are provided in Appendix 3, particularly Table A.3-7 on pages A.3-58 through A.3-70.
Water Code §§ 10631(d)(1) and (2) – Past, Current, and Projected Water Use	Urban retail water suppliers are to quantify past, current, and projected water use by sector in five-year increments • Not applicable to Metropolitan (which is a wholesaler) because this reporting requirement applies only to urban retail water suppliers. However, Metropolitan voluntarily provides this information in the following Sections: • See Section 1.3, page 1-13 and Figure 1-4 for historical retail water demands. • Past, current, and future water uses are shown in Appendix 1, Table A.1-13 on page A.1-14. Water uses by sector and county are shown in Tables A.1-6 through A.1-11 on pages A.1-13 through A.1-15. Water demands by sector are shown in Appendix 12 DWR Submittal Tables 4-1, 4-2, and 4-3. Identify and quantify sales to other agencies • See Section 1.3, page 1-13 and Figure 1-4 for historical retail water demands. • Historic sales are presented in Table A.2-2 on page A.2-3. • Metropolitan does not project sales by individual agency. However, total projected sales/demands to other agencies are shown in Section 2.2, pages 2-7 through 2-14.

Summary of Compliance

Water Code §§ 10631(d)(1)(J), (d)(3)(A)-(C) – Distribution System Water Loss	Urban retail water suppliers are to quantify distribution system water loss for each of the 5 years before the plan update • Not applicable to Metropolitan (which is a wholesaler) because this reporting requirement applies only to urban retail water suppliers. However, Metropolitan voluntarily provides this information in the following Sections: • Section 2.6, page 2-43, Appendix 7, Tables A.7-1 to A.7-5, and Appendix 12, DWR Submittal Table 4-4 (Optional for Wholesaler).
Water Code § 10631(d)(4)(A) and (B) – Water Savings Estimate	Water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans Provide citations to the codes, standards, ordinances, or transportation and land use plans used to make projections Indicate extent that water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. • See discussion on estimating demands and code-based conservation in Section 2, page 2-9 and Appendix 6.
Water Code § 10631(e)(2) – Description of Supplier's Water Demand Management Measures, Distribution System Asset Management, Assistance Programs	Provide narrative description of items in §10631(e)(1)(B)(ii), (iv), (vi), and (vii), distribution system asset management, and wholesale supplier assistance programs • See discussion on metering, Section 3.4, page 3-47. • See discussion on public education and outreach, Section 3.4, pages 3-38 through 3-43. • See discussion on water conservation programs, Section 3.4, pages 3-44 through 3-46. • See discussion on demand management and conservation, Section 3.4, pages 3-37 through 3-52. • See discussion on distribution system asset management, Section 3.4, pages 3-53 through 3-55. • See discussion on assistance programs to retail water agencies (rebate programs, public education and outreach, and other efforts to reduce water demand), Section 3.4, pages 3-37 through 3-52.
Water Code § 10631(f) – Planned Water Supply Projects and Programs	Detailed description of expected future supply projects & programs to meet projected water use Timeline for each proposed project or program Quantification of each project's normal water year yield (AFY) Quantification of each project's single dry-year water year yield (AFY) Quantification of each project's 5-year drought yield (AFY) • Section 3.1 (pages 3-3 through 3-12) describes plans for banking, exchange and transfer opportunities along the Colorado River and Aqueduct. • Section 3.2 (pages 3-13 through 3-30) describes plans for banking, exchange and transfer opportunities within the State Water Project. • Section 3.3 (pages 3-31 through 3-36) describes plans for banking, exchange and transfer opportunities within the Central Valley/State Water Project. • Section 3.6 (pages 3-79 through 3-82) describes plans for banking, exchange and transfer opportunities within the local region. • Further details are provided in Appendix 3, particularly Table A.3-7 on pages A.3-58 through A.3-70. • See Appendix 12, DWR Submittal Table 6-7.

Summary of Compliance

Water Code § 10631(g) – Opportunities for Development of Desalinated Water	Describe opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply • See discussion on groundwater recovery and seawater desalination in Section 1.4, pages 1-24 through 1-26, and Section 3.5, pages 3-56 through 3-73. • See Appendix 5, Table A.5-2 on pages A.5-9 through A.5-11 for a list of existing, under construction, CEQA, and conceptual groundwater recovery projects and their ultimate yield/capacity. • See Appendix 5, Table A.5-3 on page A.5-12 for a list of existing, CEQA, and conceptual seawater desalination projects.
Water Code § 10631(h) – If Supplier Relies on a Wholesale Supplier for Water	Urban water suppliers that rely on wholesale agency for water source must provide wholesale agency with water use projections in 5-year increments to 20 years or as far as data is available. Wholesaler to provide urban water suppliers with existing and planned water supply availability projections, by source, and planned water supply quantities over same 5-year increments and during various water-year types. • See discussions on Metropolitan and member agency coordination for the IRP Process in Sections 2 and 5. • See Appendix 3, Table A.3-7, and Appendix 12, DWR Submittal Table 2-4.
Water Code § 10631.1 – Projected Water Use for Low-Income Housing	Water use projections for single-family and multi-family residential housing for lower income households. • This is incorporated with the retail demand forecast, as reflected in Section 2 and Appendix 1.
Water Code § 10631.2 – Calculation or Estimation of Energy Intensity of Urban Water Systems	Must include any of the following that the supplier can readily obtain: estimated amount of energy for extraction or diversion (from sources), conveyance, treatment, distribution, treated water supplies compared to nontreated water supplies, and storage of water, and any other appropriate energy-related information. • Estimate of the amount of energy used and energy intensity is presented in Appendix 10. • See Section 3.8 for discussion of Metropolitan's Energy Management Initiative.
Water Shortage Contingency Plan	
Water Code § 10632 – Water Shortage Contingency Plan **Water Code § 10632(a)(1) – Analysis of Water Supply Reliability**	Every supplier shall prepare and adopt a water shortage contingency plan as part of its Plan. Water shortage contingency plan must include the analysis of water supply reliability conducted pursuant to Section 10635. • See Section 2.5 and Appendix 4 For Water Supply Reliability assessments • See Sections 2.2, 2.3, and 2.4

Summary of Compliance

Water Code § 10632(a)(2) – Procedures Used to Conduct Annual Water Supply and Demand Assessment	Written decision-making process used each year to determine water supply reliability. Key data inputs and assessment methodology to evaluate water supply reliability for current year and one dry year, including: (i) current year unconstrained demand, (ii) current year available supply, (iii) existing infrastructure capabilities and plausible constraints, (iv) locally applicable evaluation criteria used for each annual water supply and demand assessment, and (v) description and quantification of each water supply source. • See Section 2.5 and Appendix 4
Water Code § 10632(a)(3)(A) – Six Standard Water Shortage Levels	Six standard water shortage levels corresponding to ranges of up to 10, 20, 30, 40, and 50% shortages and greater than 50% shortage. Shortage levels shall be defined based on the suppliers' water supply conditions, including percentage reductions in water supply, changes in groundwater levels, changes in surface elevation or level of subsidence, or other changes in hydrological or other conditions indicative of available water supply. Shortage levels also apply to catastrophic interruption of water supplies, including regional power outage, earthquake, Delta levee failure, and aqueduct failure. • See discussion of Water Shortage Contingency Plan in Section 2.5 and Appendix 4, including description of Metropolitan's Water Surplus and Drought Management Plan and Water Supply Allocation Plan. • See discussion of Metropolitan's Emergency Storage Objective developed under its catastrophic supply interruption plan in Section 2.5 and Appendix 8. • See Appendix 12, DWR Submittal Tables 8-1, 8-2, and 8-3
Water Code § 10632(a)(4) – Shortage Response Actions	Shortage response actions that align with the shortage levels and include: (i) supply augmentation actions, (ii) demand reduction actions, (iii) operational changes, (iv) mandatory prohibitions against specific water use practices, and (v) estimated extent to which the gap between supplies and demand will be reduced by each action. • See discussion of Water Shortage Contingency Plan in Section 2.5 and Appendix 4, including description of Metropolitan's Water Surplus and Drought Management Plan and Water Supply Allocation Plan. • See discussion of Metropolitan's Emergency Storage Objective developed under its catastrophic supply interruption plan in Section 2.5 and Appendix 8. • See Appendix 12, DWR Submittal Tables 8-1, 8-2, and 8-3.
Water Code § 10632(a)(5) – Communication Protocols and Procedures	Communication protocols and procedures to inform customers, the public, interested parties, and governments regarding: (i) any current or predicted shortages, (ii) any shortage response actions triggered or expected to be triggered, and (iii) any other relevant communications. • See Section 2.5 and Appendix 4.
Water Code § 10632(a)(6) – Customer Compliance, Enforcement, Appeal, and Exemption Procedures	For an urban retail water supplier, customer compliance, enforcement, appeal, and exemption procedures for triggered shortage response actions. • Not applicable to Metropolitan as a wholesaler.

Summary of Compliance

Water Code § 10632(a)(7) – Legal Authorities	Describe legal authorities that empower supplier to implement shortage response actions. Statement that supplier will declare a water shortage emergency in compliance with Chapter 3 (Water Code §§ 350-359 re Water Shortage Emergencies). Statement that supplier will coordinate with any city or county within which it supplies water supply services for the possible proclamation of a local emergency. • See Section 2.5 and Appendix 4.
Water Code § 10632(a)(8) – Financial Consequences	Describe financial consequences of and responses for drought conditions. Describe potential revenue reductions and expense increases associated with shortage response actions, and mitigation actions to address such reductions and increases. Describe cost of compliance with Chapter 3.3 (Water Code §§ 365-367 re Excessive Water Use During Drought). • See Sections 2.5 and 2.7, page 2-27, and Appendix 4.
Water Code § 10632(a)(9) – Monitoring and Reporting Requirements and Procedures for Customer Compliance and State Reporting	For an urban retail water supplier, monitoring and reporting requirements and procedures for monitoring customer compliance and to meet state reporting requirements. • Not applicable to Metropolitan as a wholesaler.
Water Code § 10632(a)(10) – Reevaluation and Improvement Procedures	Reevaluation and improvement procedures for systematically monitoring and evaluating the functionality of the water shortage contingency plan. • See Section 2.5 and Appendix 4.
Water Code § 10632(b) – Water Features	Analyze and define water features artificially supplied with water separately from swimming pools and spas when developing water shortage contingency plan • Not applicable to Metropolitan because prohibitions against specific water use practices are enforced on end users and are not within Metropolitan's authority as a wholesaler.
Water Code § 10632(c) – Plan Availability	Water shortage contingency plan shall be available to customers and any city or county within which the supplier provides water supplies no later than 30 days after adoption of the plan. • Posting of water shortage contingency plan on Metropolitan's website and provision of water shortage contingency plan to cities and counties are described in Section 5.
Water Code § 10632.5 – Seismic Risk Assessment and Mitigation Plan	Include a seismic risk assessment and mitigation plan. • See Section 2.5 and Appendix 9.

Summary of Compliance

Recycled Water Plan	
Water Code § 10633 – Recycled Water as Potential Water Source; Agency Coordination	Provide information, to the extent available, on recycled water and its potential as a water source in the supplier's service area. Coordinate plan preparation with local water, wastewater, groundwater, and planning agencies within supplier's service area. • See Section 1.4, pages 1-24 through 1-30, Section 3.5, pages 3-56 through 3-78, Tables 3-12 and 3-13 on pages 3-76 through 3-77, Appendix 2, pages A.2-8 through A.2-9, and Appendix 5, Table A.5-1. • Coordination of the plan preparation is discussed in Section 5.
Water Code § 10633(a) – Wastewater System Description	Describe the wastewater collection and treatment systems in the supplier's service area Quantify the volume of wastewater collected and treated • Not applicable to Metropolitan because it does not collect or treat the wastewater generated within its service area. Instead, Metropolitan provides a general narrative description of the wastewater collection and treatment systems operated by others in its service area. • See Section 3.5, pages 3-57 through 3-78, Table 3-8 on page 3-57, Tables 3-12 and 3-13 on pages 3-76 through 3-77, Appendix 2, pages A.2-8 through A.2-9, and Appendix 5, Table A.5-1.
Water Code § 10633(a) through (d) – Wastewater Disposal and Recycled Water Uses	Describes methods of wastewater disposal in the supplier's service area • Not applicable to Metropolitan because it does not dispose of wastewater within its service area. Instead, Metropolitan provides a general narrative description of wastewater disposal by others in its service area. • See Section 3.5, pages 3-57 through 3-78. Describe quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project. • Not applicable to Metropolitan because it does not treat or discharge recycled water. Instead, Metropolitan provides a general narrative description of the treatment and discharge of recycled water by others in its service area. • See Section 3.5, pages 3-57 through 3-78. Describe the current type, place and quantity of use of recycled water in supplier's service area Describe and quantify potential uses of recycled water Determination of technical and economic feasibility of serving the potential uses • Not applicable to Metropolitan because it does not use recycled water in its service area. Instead, Metropolitan provides a general narrative description of the use of recycled water by others in its service area, including potential uses and the technical and economic feasibility of serving the potential uses of recycled water • See Section 3.5, pages 3-56 through 3-78, Section 4, pages 4-6 through 4-7, Appendix 2, pages A.2-8 through A.2-9, and Table A.5-1.

Summary of Compliance

Water Code § 10633(e) – Projected Uses of Recycled Water	Projected use of recycled water in service area at the end of 5, 10, 15, and 20 years • See Section 2, Tables 2-1 through Table 2-3, pages 2-12 through 2-14 and Section 3.5. Compare UWMP 2015 projections with UWMP 2020 actual use of recycled water • The 2015 UWMP, Tables 2-1, 2-2, and 2-3 included the following projections for recycled water use in 2020 (without the Santa Ana River baseflow): 436 TAF for a single dry year; 427 TAF for a multiple dry year; and 436 TAF for an average year. In 2020, actual recycled water use is estimated at 441 TAF, as discussed in Table 3-14 on page 3-77 and Appendix 2, page A.2-8 of this 2020 UWMP. • See Appendix 12, DWR Submittal Table 6-5.
Water Code §§ 10633(f), (g) – Actions to Encourage Use of Recycled Water Plan to Optimize Use of Recycled Water	Describe actions, including financial incentives, that might be taken to encourage recycled water uses Describe projected results of these actions in terms of acre-feet of recycled water used per year Provide a plan to optimize the use of recycled water in the supplier's service area • Metropolitan provides a general narrative description of the actions it takes to encourage recycled water uses in its service area • See Section 1.4, pages 1-24 through 1-25, 1-27, Table 1-5, Section 3.5, pages 3-56 through 3-78, Tables 3-12 and 3-13 on pages 3-76 and 3-77, and Appendix 5, Table A.5-1.
Water Quality Impacts on Reliability	
Water Code § 10634 – Water Quality Impacts on Availability and Reliability of Supply	Discuss water quality of existing sources in 5-year increments to 20 years and how water quality affects water management strategies and supply reliability • See Section 3.2, SWP Water Quality, pages 3-25 through 3-27, 3-29. • See Section 4, Water Quality, pages 4-1 through 4-21.
Water Service Reliability	
Water Code § 10635(a) – Supply and Demand Comparison: Normal Water Year	Compare the projected normal water supply to projected normal water use over the next 20 years, in 5-year increments. • For projected water use, see Section 2, Table 2-3, page 2-14. • For projected water supply, see Table 2-6, page 2-19 and Table A.3-7 in Appendix 3, pages A.3-58 through A.3-70, and Appendix 12, DWR Submittal Table 7-2.
Water Code § 10635(a) – Supply and Demand Comparison: Single-Dry Year Scenario	Compare the projected single-dry year water supply to projected single-dry year water use over the next 20 years, in 5-year increments. • For projected water use, see Section 2, Table 2-1, page 2-12. • For projected water supply, see Table 2-4, page 2-17 and Table A.3-7 in Appendix 3, pages A.3-59 through A.3-70, and Appendix 12, DWR Submittal Table 7-3.

Summary of Compliance

Water Code § 10635(a) – Supply and Demand Comparison: 5-Year Drought Scenario	Project a 5-year drought period occurring between 2021-2025 and compare projected supply and demand during those years Project a 5-year drought period occurring between 2026-2030 and compare projected supply and demand during those years Project a 5-year drought period occurring between 2031-2035 and compare projected supply and demand during those years Project a 5-year drought period occurring between 2036-2040 and compare projected supply and demand during those years • Metropolitan has projected 5-year periods for the next 20 years. • For projected water use, see Section 2, Table 2-2, page 2-13. • For projected water supply, see Table 2-5, page 2-18 and Table A.3-7 in Appendix 3, pages A.3-58 through A.3-70. • See Appendix 12, DWR Submittal Table 7-4.
Water Code § 10635(b) – Drought Risk Assessment	Include a drought risk assessment for water service to customers as part of information considered in developing the demand management measures and water supply projects and programs to be included in the Plan. • See Section 2.4.
Water Code § 10635(b)(1) – Data, Methodology, and Basis	Describe the data, methodology, and basis for one or more supply shortage conditions that are necessary to conduct a drought risk assessment for a 5-year drought, starting from the year following when the assessment is conducted. • See Sections 2.1 and 2.4, and Appendices 1 and 3, specifically Table A.3-8.
Water Code § 10635(b)(2) – Reliability of Each Supply Source	Determine the reliability of each supply source under a variety of water shortage conditions. • See Section 2.3, specifically Tables 2-4, 2-5, and 2-6, and Appendix 3, specifically Tables A.3-7 and A.3-8.
Water Code § 10635(b)(3) – Comparison of Total Water Supply Sources to Total Projected Water Use	Compare the total water supply sources available with the total projected water use for the drought period. • See Section 2.3, specifically Tables 2-4, 2-5, and 2-6.
Water Code § 10635(b)(4) – Historical Drought Hydrology, Projected Supply and Demand Changes Due to Climate Change, Regulatory Changes, and Other Criteria	Consider historical drought hydrology, plausible changes on projected supplies and demands under climate change conditions, anticipated regulatory changes, and other locally applicable criteria. • See Sections 1.4, 2.6, 4, and Appendices 1, 2, 3, and 6.
Water Code § 10635(c) – Plan Submittal to Cities and Counties	Supplier to provide portion of Plan on water service reliability to cities and counties within its service area no later than 60 days after Plan submittal. • Provision of Plan to cities and counties is described in Section 5.
Water Code § 10640 – Water Shortage Contingency Plan	Supplier to prepare a water shortage contingency plan pursuant to Section 10632, periodically review the water shortage contingency plan, and adopt any amendments or changes. • See Section 2.5 and Appendix 4.

Summary of Compliance

Water Code § 10641 – Consultations with public agency, state agency or experts	Supplier may consult with and obtain comments from any public agency, state agency, or any person with special expertise as to water demand management methods and techniques • Stakeholder, state agency, public agency, and expert participation, consultation, outreach, comments, and notification are described in Section 5.
Water Code § 10642 – Public Hearing; Notice; Adoption	Encourage involvement of diverse social, cultural & economic community groups prior to and during Plan and water shortage contingency plan preparation • See Section 5, pages 5-1 through 5-12. Prior to adoption, Plan and water shortage contingency plan available for public inspection and hold public hearing • See Section 5, pages 5-5 and 5-12. Provide proof of public hearing and notice • See Section 5, page 5-11. Provide meeting notice to any city or county in service area • See Section 5, pages 5-8 and 5-11, and Appendix 12, DWR Submittal Table 10-1. Provide notice pursuant to Chapter 17.5 of the Government Code • See Section 5, page 5-12. After hearing, Plan and water shortage contingency plan shall be adopted as prepared or as modified after hearing. • See Section 5, pages 5-13 and 5-15.
Water Code §§ 10615, 10643 – Plan Implementation	Include in Plan strategy and time schedule for implementation Implement Plan in accordance with the schedule set forth in the Plan • Metropolitan has conducted a review of its planning progress through the 2020 IRP Update, discussed in Section 2. In addition, in each section, Metropolitan has included an "Achievement to Date" that discusses progress towards its planning goals, current issues, and potential problems with continued implementation of the Plan. • Section 3 summarizes the implementation plan and continued progress in developing a diversified resource mix consistent with the IRP to meet the region's water supply needs DMM Programs • Metropolitan's conservation plan and approach are discussed in Section 3.4. Individual conservation programs are discussed on pages 3-44 through 3-48.
Water Code § 10644(a)(1) –Plan Submittal	Submit to DWR, the California State Library, and any city or county within service area copy of Plan no later than 30 days after adoption. • Plan submission is described in Section 5.
Water Code § 10644(a)(2) – Plan shall include any Standardized Forms, Tables, or Displays specified by DWR	Submit Plan electronically Include in Plan DWR's standardized forms, tables, or displays • Plan submission is described in Section 5. • DWR's standardized tables for wholesale urban water agencies are completed and presented in Appendix 12.
Water Code § 10644(b) – Water Shortage Contingency Plan Revision	Submit copy of revised water shortage contingency plan to DWR no later than 30 days after adoption. • Plan submission is described in Section 5 and Appendix 4.

Summary of Compliance

Water Code § 10645 – Plan and Water Shortage Contingency Plan Available for Public Review	No later than 30 days after plan submittal, the supplier and DWR to make the Plan and water shortage contingency plan available for public review during normal business hours. • Posting of Plan and water shortage contingency plan on Metropolitan's website for public review is described in Section 5.

This page intentionally left blank.

Executive Summary and Simple Lay Description of 2020 UWMP Findings

Metropolitan's 2020 Urban Water Management Plan (UWMP) has been prepared in compliance with the California Water Code (CWC)[1]. This Executive Summary satisfies the requirement of CWC Section 10630.5 to include a simple lay description of information necessary to provide a general understanding of the plan, including a description of Metropolitan's reliable water, as well as its needs, strategies, and potential challenges for the foreseeable future.

This plan provides an assessment of Metropolitan's water service reliability, describes and evaluates sources of water supply, efficient uses of water, demand management measures, implementation strategy and schedule, and other relevant information and programs. In addition to the water reliability assessments, the plan includes an evaluation of frequent and severe periods of droughts, as described in the Drought Risk Assessment, and the preparation and adoption of the Water Shortage Contingency Plan (WSCP).

Metropolitan's 2020 UWMP was developed as part of the 2020 Integrated Water Resources Plan (IRP) planning process and provides a representation of Metropolitan's planning elements reported under the conditions required by the Act. The IRP represents Metropolitan's comprehensive planning process and will serve as Metropolitan's blueprint for long-term water reliability, including key supply development and water use efficiency goals. Together, these plans serve as the reliability roadmap for the region. The planning process involved extensive coordination with Southern California's water agencies, municipal service providers, and public planning agencies. Metropolitan's Board of Directors provided oversight throughout the ongoing process for the development of the 2020 IRP that informed the preparation of the 2020 UWMP. Metropolitan's outreach efforts sought to engage the general public, businesses, environmental organizations, diverse communities, cities, counties, and other stakeholders with an interest in the future of Southern California's water supplies. The information included in the 2020 UWMP represents the most current and available planning projections of supply capability and demand forecasts developed through a collaborative process with the member agencies.

As with Metropolitan's previous plans, the 2020 UWMP does not explicitly discuss specific activities undertaken by its member agencies unless they relate to one of Metropolitan's water demand or supply management programs. Presumably, each member agency will discuss these activities in its UWMP.

Factors Considered for Metropolitan's Water Reliability Assessments for the UWMP

The Act requires reporting agencies to describe their water service reliability under the conditions associated with a normal water year, single dry-year, and droughts lasting at least five consecutive water years, with projected information in five-year increments for 20 years. The factors used to evaluate Metropolitan's supply and demand balance for the 2020 UWMP are

[1] This UWMP complies with the Urban Water Management Planning Act (Act), which was added by Statute 1983, Chapter 1009, became effective on January 1, 1984, and currently includes CWC Sections 10610 through 10657; and with CWC Section 10608.36 which was added by SB X7-7 in 2009.

presented below. Some of the considerations and resulting projections may change as Metropolitan's planning progresses. These changes may be reflected in future updates of the UWMP. Metropolitan and its member agencies have engaged in a comprehensive regional planning process called the IRP since the 1990s. In its 2020 IRP process, Metropolitan and its member agencies are using a scenario planning approach to identify and account for the broad range of uncertainty that the region faces in its water supplies and demands. Instead of focusing on a target for future water supply needs based on a single projected outcome of supplies and demands, this approach encouraged broader thinking and discussion of possible future conditions for local and imported water supply and retail demand, and the policy implications for Metropolitan and its service area. Adaptive management during implementation will allow flexibility in how the region prepares for the supply and demand conditions as they evolve through the future. The scenario planning in the 2020 IRP started with identifying the major drivers of change that impact water supply and demand for the region, understanding how they interact, and then assessing the potential scale of impact in the future. Data sources and quantification methods were identified that could be used for quantitative and qualitative analysis of the drivers and their impact on water supplies and demands. The detailed analyses of future local and imported water supplies; economic growth, demographics and water demands; and changing hydrology were incorporated into the UWMP. The IRP planning effort and policy discussions continued into 2021.

Hydrologic Conditions and Reporting Period

The 2020 UWMP presents Metropolitan's water reliability assessments from 2025 through 2045. As specified in the Act, there are three water-year types that must be included in the water service reliability assessment for the UWMP. To simulate hydrologic conditions for the required reliability assessments, Metropolitan assumed the following:

- <u>Normal Year</u>. The average of historic years 1922 to 2017 most closely represents the water supply conditions that Metropolitan considers available during a normal water year.
- <u>Single Dry Year</u>. The conditions for the year 1977 represent the lowest total water supply available to Metropolitan.
- <u>Five-Consecutive-Year Drought</u>. The five consecutive years of 1988 to 1992 represent the driest five-consecutive year historical sequence for Metropolitan's water supply. This five-year sequence is used to complete both Metropolitan's water service reliability and drought risk assessments.

Metropolitan developed and evaluated estimates of future demands and supplies from local sources and from Metropolitan sources based on a record of 96 years (1922-2017) of historic hydrology. Supply and demand analyses for the single dry year and droughts lasting at least five consecutive water years were based on conditions affecting the watershed and supplies from the SWP, as this supply availability fluctuates the most among Metropolitan's sources of supply. Using the same 96-year period of the SWP supply availability, 1977 is determined to be the single driest year and 1988-92 is the driest 5-year historical sequence that represents the lowest water supply available for SWP supplies to Metropolitan. In addition, staff analysis of the 8-river index, an indicator of river flow and runoff in the SWP watershed, indicated that 1977 is the single driest year and 1988-92 is the lowest 5 consecutive dry years from 1922 through 2017. The 8-river index is used by DWR and other water agencies as an estimate of the unimpaired runoff (or natural water production) of the Sacramento and San Joaquin River basins, which are sources of water for the SWP.

Demand Projections

Within Metropolitan's service area, retail water demands can be met with local supplies or imported supplies. In the UWMP, Metropolitan's supply reliability assessments focus on the future demands for Metropolitan's imported and other supplies. The expected firm demand on Metropolitan is the difference between total demands, adjusted for conservation, and projected total local supplies. Thus, in order to project the regional need for water, Metropolitan starts with a projection of total demand including retail Municipal and Industrial (M&I), retail agricultural, seawater barrier, and replenishment demands, determines the adjustments from total conservation, and subtracts the total local supplies that are available to meet a portion of those demands.

Total Demands

Demographic growth is a major driver of the current and future retail M&I water demand. Metropolitan updates its retail M&I projection periodically based on the release of official regional demographic and economic projections, and in the 2020 IRP, alternative demographic projections are being evaluated. The projections of retail M&I water demands used in the 2020 UWMP are based on demographic data and projections taken from the following reports:

- Southern California Association of Governments (SCAG) Connect SoCal: The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy (May 2020)
- San Diego Association of Governments (SANDAG) San Diego Forward: The 2019 Federal Regional Transportation Plan (October 2019)

The SCAG and SANDAG regional growth forecasts are the core assumptions for the retail M&I demand forecasts for the UWMP assessments. These forecasts drive the estimating equations of the retail demand forecasting in Metropolitan's Econometric Demand Model (MWD-EDM). Both SCAG and SANDAG prepare demographic forecasts based on land use data for their respective regions through extensive processes that emphasize input from local planners and are done in coordination with local or regional land use authorities, incorporating essential information to reflect anticipated future populations and land uses. SCAG's and SANDAG's projections undergo extensive local review, incorporate zoning information from city and county general plans, and are supported by Environmental Impact Reports.

Retail agricultural demands consist of retail level water use for irrigating crops. Metropolitan's member agencies estimate agricultural water use based on many factors, including farm acreage, crop types, historical water use, and land use conversion. Each member agency estimates its agricultural demands differently, depending on availability of information. Metropolitan relies on member agencies' estimates of agricultural demands for the 2020 UWMP.

Metropolitan also includes in its assessment of total demands the local groundwater requirements for seawater barrier and groundwater basin replenishment. Seawater barrier demands represent the amount of water needed to hold back seawater intrusion into the coastal groundwater basins. Replenishment demands represent the amount of water that member agencies plan to use to replenish the groundwater basins and augment natural replenishment from precipitation. Metropolitan relies on member agencies' and groundwater management agencies' projections for these demands, as well as projections of local supplies that are also used to meet these demands.

Total Conservation

Projected regional water demand is adjusted to account for water conserved by best management practices from active, code-based, and price-effect conservation. Active conservation levels are derived by calculating water savings from all active program device-based savings installed to date. Code-based conservation levels are derived by calculating water savings from devices covered by existing water conservation ordinances and plumbing codes, including the state Model Water Efficient Landscape Ordinance, with replacement and new construction rates driven by demographic growth consistent with SCAG and SANDAG land use and transportation plans used to derive retail demand. Price-effect conservation is derived by calculating water savings by retail customers attributable to the effect of changes in the real (inflation adjusted) price of water.

Total Local Supplies

Projections of local supplies are based on information gathered from Metropolitan's annual local production surveys and communications between Metropolitan and member agency staff. The projections include groundwater and surface water production, recycled water and recovery of contaminated or degraded groundwater (funded under the Metropolitan's Local Resources Program, as well as local agency funded programs), and seawater desalination. The local supply projections presented in demand tables for the 2020 UWMP are consistent with the local supply projections reported in member agencies' UWMPs, with one variation being the Colorado River water SDCWA exchanges with Metropolitan for deliveries of blended Metropolitan water.

The total local supplies presented in the 2020 UWMP also include projections of Los Angeles Aqueduct deliveries from the Los Angeles Department of Water and Power (LADWP).

Water Use Reduction Achievement in 2020

On November 10, 2009, the state Legislature passed Senate Bill 7 as part of the Seventh Extraordinary Session, referred to as SB X7-7 or the Water Conservation Act of 2009. This law is the water conservation component to the historic Delta legislative package, and seeks to achieve a 20 percent statewide reduction in urban per capita water use in California by December 31, 2020. According to CWC Section 10608.36, wholesale agencies are required to include in their UWMPs an assessment of present and proposed future measures, programs, and policies that would help achieve the water use reductions required under SB X7-7. Urban wholesale water suppliers are not required to comply with the target-setting and reporting requirements of SB X7-7.

As a wholesale water agency, Metropolitan is not required to establish or report on an urban water use reduction target. However, Metropolitan's regional conservation programs and local resource programs are designed to assist member agencies and retail water suppliers in the service area to comply with SB X7-7. Therefore, Metropolitan monitors the progress of its service area. Also, in compliance with SB X7-7, Metropolitan assesses its actions, programs, and policies to help achieve the water use reductions required by SB X7-7.

Based on an analysis of population, demand, and the methodologies for setting targets described in the legislation, Metropolitan's baseline per capita water use is 182 GPCD, and the 2020 reduction target is 146 GPCD. From 2011 to 2014, there was a slight increase in per capita water use explained in part by continued economic recovery and drier weather as compared to previous years. With mandatory restrictions from the state and implementation of Metropolitan's Water Supply Allocation Plan, Metropolitan's 2015 UWMP reported an interim water use reduction achievement of 131 gallons per capita per day (GPCD), which is a 28 percent reduction from the baseline. Over the last five years, Metropolitan continued to provide support for retail agency water use reduction efforts through technical assistance, legislation, code and standards updates, and financial incentives where needed to increase water use efficiency. Based on best available data as of January 2021, Metropolitan estimates a 2019 per capita water use of 121 GCPD, well exceeding Metropolitan's 2020 water use target of 146 GPCD with a 34 percent reduction from the baseline.

Supply Capabilities

The 2020 UWMP reports on Metropolitan's water reliability and identifies projected supplies to meet the long-term demand within its service area. For the 2020 UWMP reliability assessments, Metropolitan's supply capabilities are evaluated using the following assumptions for its imported supplies:

Colorado River Supplies

Colorado River supplies include Metropolitan's basic Colorado River apportionment, along with supplies that result from existing and committed programs, including those from the IID-MWD Conservation Program, the implementation of the Quantification Settlement Agreement (QSA) and related agreements, and the exchange agreement with SDCWA. The QSA established the baseline water use for each of the agreement parties and facilitates the transfer of water from agricultural agencies to urban uses. Since the QSA, additional programs have been implemented to increase Metropolitan's supplies. These include the PVID Land Management, Crop Rotation, and Water Supply Program, as well as the Lower Colorado River Water Supply Project. The 2007 Interim Guidelines provided for the coordinated operation of Lake Powell and Lake Mead, as well as the Intentionally Created Surplus (ICS) program that allows Metropolitan to store water in Lake Mead. These stored supplies can be used to supply additional water to ensure that, when needed, Metropolitan can deliver up to Metropolitan's Colorado River Aqueduct (CRA) capacity of 1.25 MAF.

In light of declining reservoir levels, the Lower Basin Drought Contingency Plan (DCP) was signed in 2019. This agreement incentivizes storage in Lake Mead and requires certain volumes of water be stored in Lake Mead under certain Lake Mead elevation levels through 2026. Metropolitan is to store certain volumes of water in Lake Mead as DCP ICS once Lake Mead is below elevation 1,045 feet. This agreement also increases Metropolitan's flexibility to take delivery of water stored as ICS at Lake Mead elevations below 1,075 feet. The goal of this agreement is to keep Lake Mead above critical elevations, and overall, it increases Metropolitan's flexibility to store water in Lake Mead in greater volumes and to take delivery of stored water to fill the CRA as needed.

Projections for Colorado River supplies for the 2020 UWMP are based on the United States Bureau of Reclamation's (USBR) Colorado River Simulation System (CRSS) modeling developed in January 2021, which is the latest available at the time of production of this plan. USBR modeling is used to estimate Metropolitan's basic apportionment and the availability of QSA and other related programs.

State Water Project Supplies

State Water Project (SWP) supplies are estimated using the 2019 SWP Delivery Capability Report distributed by the California Department of Water Resources (DWR) in August 2020. The 2019 Delivery Capability Report presents the current DWR estimate of the amount of water deliveries for current (2020) conditions and conditions 20 years in the future under DWR's set of stated assumptions. These estimates incorporate restrictions on SWP and Central Valley Project (CVP) operations in accordance with water quality objectives established by the State Water Resources Control Board, the biological opinions of the U.S. Fish and Wildlife Service and National Marine Fisheries Service issued on October 21, 2019, and the Incidental Take Permit issued by the California Department of Fish and Wildlife on March 31, 2020. In addition, these estimates incorporate amendments to the Coordinated Operations Agreement between the Central

Valley Project and the State Water Project made in 2018. Under the 2019 Delivery Capability Report, the delivery estimates for the SWP for 2019 conditions as percentage of Table A amounts are 7 percent, equivalent to 134 TAF for Metropolitan, under a single dry-year (1977) condition and 58 percent, equivalent to 1.1 MAF for Metropolitan, under the long-term average condition.

In dry, below-normal conditions, Metropolitan has increased the supplies received from the California Aqueduct by developing flexible Central Valley/SWP storage and transfer programs. Over the years, under the pumping restrictions of the SWP, Metropolitan has collaborated with the other contractors to develop numerous voluntary Central Valley/SWP storage and transfer programs. The goal of these storage/transfer programs is to develop additional dry-year supplies that can be conveyed through the California Aqueduct during dry hydrologic conditions and regulatory restrictions.

Storage

A key component of Metropolitan's water supply capability is the amount of water in Metropolitan's storage facilities. Storage is a major component of Metropolitan's dry-year and emergency resource management strategy. Metropolitan's likelihood of having adequate supply capability to meet projected demands, without implementing the Water Supply Allocation Plan (WSAP), depends on its storage resources. Metropolitan's WSCP also underscores the importance of storage as it is identified as one of potential shortage response actions at various water shortage levels.

In developing the supply capabilities for the 2020 UWMP, Metropolitan assumed the current (2020) storage levels at the start of simulation and used the median storage levels going into each of the five-year increments based on the balances of supplies and demands. Under the median storage condition, there is an estimated 50 percent probability that storage levels would be higher than the assumption used, and a 50 percent probability that storage levels would be lower than the assumption used. All storage capability figures shown in the 2020 UWMP reflect actual storage program conveyance constraints. It is important to note that under some conditions, Metropolitan may choose to implement the WSAP in order to preserve storage reserves for a future year, instead of using the full supply capability. This can result in impacts at the retail level even under conditions where there may be adequate supply capabilities to meet demands.

Findings of the 2020 Urban Water Management Plan

The 2020 UWMP provides an assessment and summary of Metropolitan's water service reliability outlook through 2045 under the assumptions and cited sources of information described above. As a reporting document, the UWMP will be updated every five years to reflect changes in water demand and supply projections.

The 2020 UWMP satisfies all the content and process requirements mandated by the Act, including the required collaboration for its planning initiatives and report preparation. It should be noted that Metropolitan's primary planning venue is its IRP and that the scenario planning approach within its 2020 IRP is intended to extend Metropolitan's planning beyond single scenario outcomes like that shown within this UWMP. The key findings of Metropolitan's 2020 UWMP are as follows:

Water Service Reliability and Projected Water Supplies

- Metropolitan has completed its water service reliability assessment, under the stated UWMP assumptions and conditions required by the Act, and determined that it has supply capabilities sufficient to meet expected demands from 2025 through 2045 under a single dry-year condition and a period of drought lasting five consecutive water years, as presented in Figure ES-1, as well as in a normal water year hydrologic condition.

- Metropolitan has evaluated its water shortage risk, under the stated UWMP assumptions and conditions required by the Act, and determined that it has supply capabilities sufficient for a drought period that lasts five consecutive water years based on the driest five-year historic sequence for Metropolitan's water supply. This Drought Risk Assessment was completed starting from the year following when the assessment is conducted (2021 through 2025) and is presented in Figure ES-2.
- Metropolitan has plans for supply implementation and continued development of a diversified resource portfolio including programs in the Colorado River, SWP, Central Valley storage and transfers programs, local resource projects, and in-region storage that enables the region to meet its water supply needs.
- Metropolitan has developed comprehensive plans for stages of actions it would undertake to address frequent and severe periods of droughts; six standard water shortage levels corresponding to progressive ranges of up to 10, 20, 30, 40, and 50 percent shortages and greater than 50 percent shortage; and a catastrophic interruption in water supplies through its Water Shortage Contingency Plan, Water Surplus and Drought Management Plan (WSDM Plan)[2], and Water Supply Allocation Plan (WSAP)[3].
- Metropolitan continues to invest in measures that will help improve the region's water use efficiency over time.
- Metropolitan continues to plan for emergency and catastrophic scenarios, recently revising an Emergency Storage Objective to manage against potential interruption in water supplies resulting from catastrophic occurrences within the Southern California region, including seismic events along the San Andreas fault, and Seismic Risk Assessment and Mitigation Plan to assess the vulnerability of Metropolitan's water system and mitigate those vulnerabilities. In addition, Metropolitan is working with the State on the Delta Risk Management Strategy to reduce the impacts of a seismic event in the Delta that would cause levee failure and disruption of SWP deliveries.
- Metropolitan has and will continue to regard water quality with paramount importance to water supply reliability. Metropolitan owns and operates five water treatment plants, three of which are among the 10 largest in the world. Metropolitan is a national leader in providing safe drinking water that meets increasingly stringent standards, testing for over 400 constituents and performing nearly 200,000 water quality tests annually on samples gathered throughout its distribution system. Metropolitan's Water Quality Laboratory analyzes these samples to ensure that Metropolitan's delivered water meets or surpasses all state and federal drinking water standards. Because treatment to remove specific contaminants can be more costly than measures to protect water at the source, Metropolitan also actively supports improved watershed protection programs for its source waters in the Colorado River and State Water Project.

[2] The WSDM plan is a coordinated plan used to direct Metropolitan's resource operations to help attain the region's reliability goal recognizing the interdependence of surplus and shortage actions. The WSCP is consistent with the WSDM Plan. See Attachment A in Appendix 4.

[3] The WSAP is intended as an equitable approach for encouraging water use efficiency and minimizing regional impacts in times of shortage consistent with the principles and considerations approved by the Board through the WSDM Plan. See Attachment B in Appendix 4.

Challenges Ahead and Strategies for Managing Reliability Risks

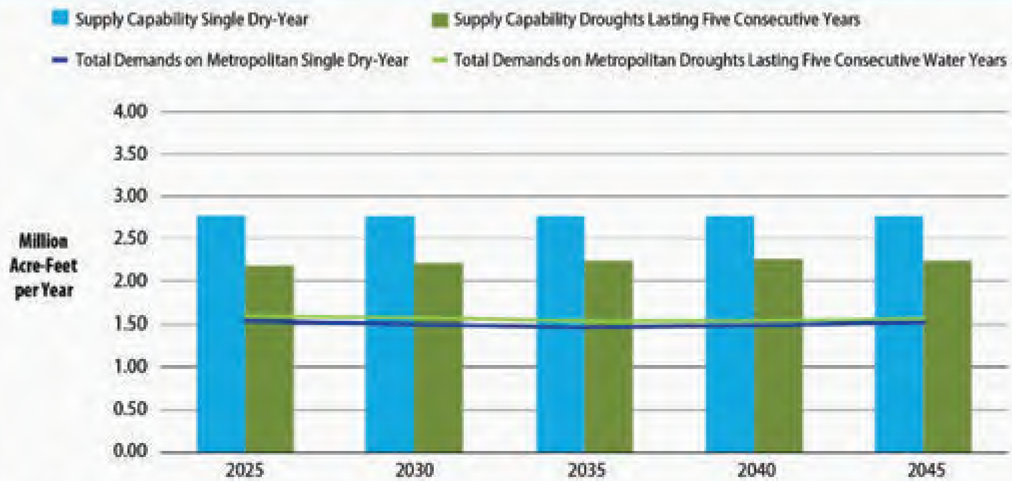
- Metropolitan faces a number of challenges in providing adequate, reliable, and high-quality supplemental water supplies for southern California: The Colorado River Basin has historically experienced large swings in annual hydrologic conditions; however, these swings have largely been buffered through a large volume of storage.
- Dramatic swings in annual hydrologic conditions have impacted water supplies available from the State Water Project (SWP) over the last decade. Metropolitan's efforts in building dry-year storage reserves, water banking and transfers have helped manage the wide swings in SWP allocations.
- With approximately 30 percent of Southern California's water supply transported across the Bay-Delta, its declining ecosystem has led to reduction in water supply deliveries. Operational constraints will likely continue until a long-term solution to the problems in the Bay-Delta is identified and implemented.
- Approximately half of the region's water supplies come from resources controlled or operated by local water agencies. These resources include water extracted from local groundwater basins, catchment of local surface water, non-Metropolitan imported water supplied through the Los Angeles Aqueduct, and Colorado River water exchanged for Metropolitan supplies.
- Water quality challenges, such as algae toxins, per- and polyfluoroalkyl substances (PFAS), and the identification of constituents of emerging concern, have a significant impact on the region's water supply conditions and underscore the importance of flexible and adaptive regional planning strategies.

Metropolitan continues to address these water supply challenges through a variety of actions that will maintain water reliability within its service area. Metropolitan's proactive measures include:

- **Continuing water conservation** by expanding outreach, adding devices, and increasing incentives to residents,
- **Increasing local resources** by providing incentives for on-site recycled water hook-up and the Local Resources Program (LRP),
- **Augmenting water supplies** through water transfers and exchanges,
- **Improving return capability of storage programs** to effectively take delivery of water when needed,
- **Maintaining dry year and emergency storage for the region** to remain reliable during periods of low supply and emergencies,
- **Modifying Metropolitan's distribution system** to enhance operational flexibility and efficient delivery of Colorado River, State Water Project, and in-region supplies within Metropolitan's service area,
- **Implementing shortage response actions** under the Water Shortage Contingency Plan and elements of the Water Surplus and Drought Management Plan and Water Supply Allocation Plan to distribute the limited imported supplies and preserve storage reserves, and
- **Responding to water quality concerns** by protecting the quality of the source water, developing water management programs that maintain and enhance water quality, and changing water treatment protocols or blending.

Sections 1.4 and 2.6 offer detailed discussions and additional insight on Metropolitan's current challenges, current available resources, short-term supply outlook, other supply reliability risks, and recent and near-term actions to meet these challenges.

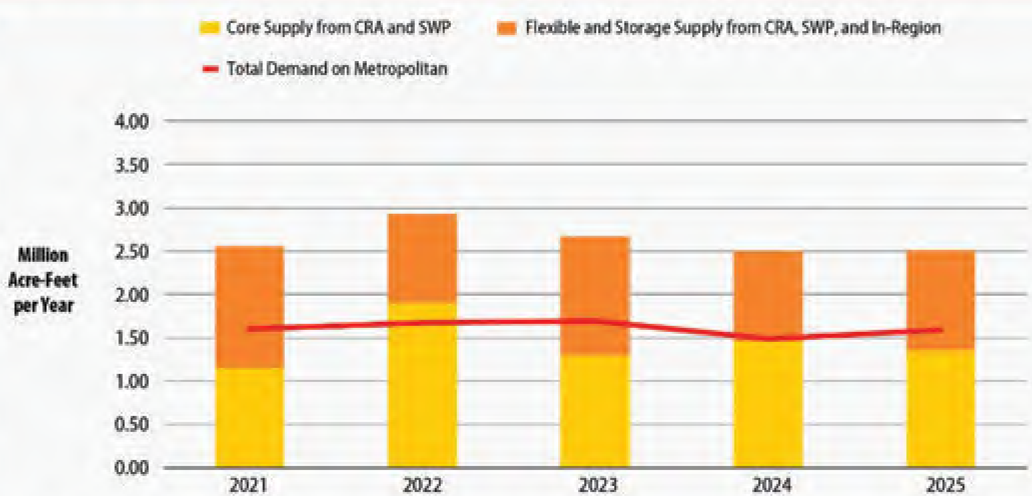
Figure ES -1 Supply Capabilities under Single Dry-Year and Droughts Lasting Five Consecutive Years



Notes:

1. Supply capabilities are derived using the simulated median storage level going into each of five-year increments based on the balances of supplies and demands. Under the median storage condition, there is an estimated 50 percent probability that storage levels would be higher than the assumption used, and a 50 percent probability that storage levels would be lower than the assumption used.
2. Under some conditions, Metropolitan may choose to implement the WSAP in order to preserve storage reserves for a future year, instead of using the full supply capability. This can result in impacts at the retail level even under conditions where there may be adequate supply capabilities to meet firm demands.
3. All storage capability figures shown in the 2020 UWMP reflect actual storage program conveyance constraints.
4. Total demands on Metropolitan illustrated in the figure includes delivery obligations associated with Exchange with SDCWA.

Figure ES -2 Drought Risk Assessment for 2021-2025



Notes:

1. Drought risk assessment for 2021-2025 is based on historic 1988 to 1992 conditions (driest five consecutive year historic sequence for Metropolitan's water supply) .
2. Shortfall from core supplies may be met through supply augmentation actions by exercising Metropolitan's flexible supplies and storage from CRA, SWP, and In-Region.
3. As of January 2021, Metropolitan has 3.2 MAF of dry-years supplies that may be utilized to meet sfortfall from core supplies.
4. Metropolitan may also implement demand reduction and operational flexibility as part of its shortage response actions, if needed.
5. Total Demand on Metropolitan illustrated in the figure includes delivery obligations associated with Exchange with SDCWA.

Introduction 1

1.1 Introduction to this Document and the Agency

Organization of this Document

Metropolitan's 2020 Urban Water Management Plan (UWMP) was prepared in compliance with California Water Code (CWC) Sections 10610 through 10657 of the Urban Water Management Planning Act (Act), which were added by Statute 1983, Chapter 1009 and became effective on January 1, 1984, and Section 10608.36 of SB X7-7, which was enacted in 2009. In addition to complying with the Act, this report details Metropolitan's current situation and how it will meet the challenges of the future.

This document contains five sections. The first section is the Introduction that defines Metropolitan in terms of governance, structure, and current water supply status. This section also briefly outlines how Metropolitan will meet current and future challenges. The second section describes Metropolitan's planning activities and explains how the agency will manage the region's water resources to ensure a reliable water supply for the region. The third section describes the actions Metropolitan has taken to implement the plans outlined in Section 2 and lists future programs and activities. The fourth section addresses the issue of water quality and steps taken to deliver high-quality water to Metropolitan's service area. The fifth section details the public outreach component integrated with Metropolitan's planning processes. In addition, this document includes Appendices that contain supporting documents on the required and voluntary reporting elements. The sections are further described in detail below:

Section 1 - Introduction

In addition to demonstrating how this report complies with the Act, the 2020 UWMP details Metropolitan's current situation and outlines its plan for meeting the challenges of the future. The Introduction section includes:

- Discussion of the Act and Metropolitan's reporting responsibilities under the Act;
- Introduction to Metropolitan and description of its formation, purpose, service area, current and projected land uses, member agencies, and governance;
- Historical, economic, and demographic information on Metropolitan's service area;
- Discussion of Metropolitan's current condition, challenges, and resource planning strategies; and
- Evaluation of Metropolitan's supply capabilities during a drought lasting five consecutive water years.

Section 2 - Planning for the Future

The Planning for the Future section discusses how Metropolitan plans to meet Southern California's water needs in the future. The section highlights the importance of Integrated Water Resources Planning (IRP) by summarizing Metropolitan's planning processes over the years and emphasizes the need for Metropolitan to implement adaptive and multiple scenario planning strategies that will prepare the region to deal with uncertainties. This section also includes:

- Evaluation of regional water demand under a normal water year, single dry-year, and droughts lasting at least five years, for years 2025 through 2045;
- Evaluation of supply capabilities under a normal water year, single dry-year, and droughts lasting at least five consecutive water years, for years 2025 through 2045;
- Evaluation of frequent and severe periods of droughts, as described in the Drought Risk Assessment for years 2021 through 2025;
- Preparation and adoption of Water Shortage Contingency Plan (WSCP), including a discussion of Metropolitan's Emergency Storage Objective and Seismic Risk Assessment and Mitigation Plan;
- Discussion of other supply reliability risks including climate change; and
- Discussion of the different elements of Metropolitan's rate structure and revenue management.

Section 3 – Implementing the Plan

The Implementing the Plan section summarizes Metropolitan's progress in developing a diversified resource mix that enables the region to meet its water supply needs. The investments that Metropolitan has made and its continuing efforts in many different areas coalesce toward its goal of long-term supply reliability for the region. This section includes:

- Discussion of resources and program development for the Colorado River, SWP, Central Valley/SWP storage and transfers programs, conservation, local resources program (groundwater recovery, recycling, desalination), and groundwater; and
- Discussion of Metropolitan's measures, programs, and policies to help achieve the SB X7-7 goal of 20 percent water use reduction by 2020 and the region's progress in meeting this target.

Section 4 - Water Quality

The Water Quality section identifies key regional water quality issues and discusses the protection of the quality of source water and development of water management programs that maintain and enhance water quality. This section also includes:

- Discussion of water quality issues of concern, constituents of emerging concern, and water quality programs that Metropolitan has undertaken to protect its water supplies.

Section 5 – Coordination and Public Outreach

The Coordination and Public Outreach section presents the processes undertaken in the development of the 2020 IRP, 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP with the public and other stakeholders. It provides a list of all meetings and workshops conducted to promote and achieve consensus and collaborative planning. Included in this section are the public notification letters and announcements distributed by Metropolitan as required by the Act and copies of the Metropolitan resolutions adopting and approving the 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP for submittal to DWR.

Appendices

The appendices provide detailed background on the information presented in the 2020 UWMP.

Appendix 1 - Demand Forecast

Appendix 2 - Existing Regional Water Supplies

Appendix 3 - Justifications for Supply Projections

Appendix 4 - Water Shortage Contingency Plan

Appendix 5 - Local Projects

Appendix 6 - Conservation Estimates and Water Savings from Codes, Standards, and Ordinances

Appendix 7 - Distribution System Water Losses

Appendix 8 - Emergency Storage Objective

Appendix 9 - Seismic Risk Assessment and Mitigation Plan

Appendix 10 - Metropolitan's Energy Intensity Calculations, Including Conveyance and Distribution Generation

Appendix 11 - Quantifying Regional Self-Reliance and Reduced Reliance on Water Supplies from the Delta Watershed

Appendix 12 - DWR 2020 UWMP Submittal Tables

Urban Water Management Planning Act

This report has been prepared in compliance with Water Code Sections 10610 through 10657 of the Urban Water Management Planning Act (Act). This Act requires that "*every urban water supplier shall prepare and adopt an urban water management plan*" (Water Code § 10620(a)). An "urban water supplier" is defined as a supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually (Water Code § 10617). These plans must be filed with the California Department of Water Resources (DWR) every five years. Recent amendments to the Act changed the Water Code to require each urban supplier to update and submit its 2020 UWMP by July 1, 2021 and changed the update and submittal dates for subsequent UWMPs to July 1 in years ending in 6 and 1.

Changes in the Act since 2015

There have been numerous changes made and new requirements added to the Act since the 2015 UWMP. Set forth below is a general overview of the key current and new requirements for urban wholesale suppliers. Detailed descriptions of these existing and new requirements are provided in the various sections of this 2020 UWMP.

- Detailed evaluation of the supplies necessary to meet demands over at least a 20-year period, in five-year increments, under a normal water year, single dry-year, and droughts lasting at least five consecutive water years;
- Instead of a water shortage contingency analysis, suppliers must adopt a water shortage contingency plan which includes 10 prescribed elements, such as the procedures used to conduct an annual water supply and demand assessment; six standard water shortage levels corresponding to progressive ranges of up to 10, 20, 30, 40, and 50 percent shortages and greater than 50 percent shortage; and shortage response actions that align with the defined shortage levels;
- Drought risk assessment which includes: (i) the data, methodology, and basis for one or more supply shortage conditions necessary to conduct a drought risk assessment for a 5-year

drought; (ii) a determination of the reliability of each supply source under a variety of water shortage conditions; (iii) a comparison of total available water supply sources to total projected water use for the drought period; and (iv) a consideration of historical drought hydrology, projected supplies and demands under climate change conditions, and anticipated regulatory changes;

- Water use projections, where available, must display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans;
- Simple lay description of information necessary to provide a general understanding of the UWMP;
- Description of supplier's service area must include current and projected land uses affecting supplier's water management planning;
- Seismic risk assessment and mitigation plan;
- Compliance with the Act is required in order for a supplier to be eligible for a water grant or loan;
- Energy information that a supplier can readily obtain; and
- Evaluation of reasonable and practical efficient water uses, recycling, and conservation activities.

Senate Bill 7 of the Seventh Extraordinary Session of 2009, Water Conservation in the Delta Legislative Package

In addition to changes to the Act, the state Legislature passed Senate Bill 7 as part of the Seventh Extraordinary Session, referred to as SB X7-7, on November 10, 2009, which became effective February 3, 2010. This law was the water conservation component to the historic Delta legislative package and seeks to achieve a 20 percent statewide reduction in urban per capita water use in California by December 31, 2020. This implements the Governor's similar 2008 water use reduction goals. The law requires each urban retail water supplier to develop urban water use targets to help meet the 20 percent goal by 2020, and an interim urban water reduction target by 2015.

The bill states that the legislative intent is to require all water suppliers to increase the efficiency of use of water resources and to establish a framework to meet the state targets for urban water conservation called for by the Governor. The bill establishes methods for urban retail water suppliers to determine targets to help achieve increased water use efficiency by the year 2020. The law is intended to promote urban water conservation standards consistent with the California Urban Water Conservation Council's adopted best management practices.

Urban wholesale water suppliers are not required to perform all of the target-setting and reporting requirements of SB X7-7. However, wholesale agencies must include in their UWMPs an assessment of present and proposed future measures, programs, and policies that would help achieve the water use reductions required under this law (Water Code § 10608.36).

Sections 3.4, 3.5, and 3.7 of this plan address actions Metropolitan took to help urban retail water suppliers to achieve the urban per capita water use reduction pursuant to the goals set forth in SB X7-7.

Metropolitan's Compliance with the Urban Water Management Planning Act

As with Metropolitan's previous plans, this Plan does not explicitly discuss specific activities undertaken by member agencies unless they relate to one of Metropolitan's water demand or supply management programs. Presumably, each member agency will discuss these activities in its Urban Water Management Plan, but elements of this Plan do not necessarily have to be adopted by the urban water suppliers or the public agencies directly providing retail water.

DWR Guidance

In April 2021, DWR issued the final 2020 UWMP Guidebook for urban water suppliers (DWR Guidebook). The 2020 DWR Guidebook was updated from the 2015 version to reflect new legislation. As part of the Guidebook, DWR updated the Standardized Submittal Tables for the reporting and submittal of UWMP data to DWR. As mentioned above, water suppliers are required to use these Standardized Submittal Tables for electronic submittal of their UWMPs to DWR to satisfy the legislative requirement (Water Code § 10644(a)(2)). For the 2020 UWMP, Metropolitan electronically submitted the Standardized Submittal Tables to DWR through its Water Use Efficiency portal. In addition, Metropolitan included the Standardized Submittal Tables in this plan as Appendix 12.

The 2020 DWR Guidebook includes a voluntary checklist to show reporting of required elements to assist DWR with its review of the submitted UWMP. Included in the beginning of this 2020 UWMP is a compliance checklist, organized by Water Code section, which summarizes Metropolitan's response to the requirements of the Water Code and indicates where each required element can be found in the Plan.

1.2 The Metropolitan Water District of Southern California

Formation and Purpose

The Metropolitan Water District of Southern California (Metropolitan) is a public agency organized in 1928 by a vote of the electorates of 13 Southern California cities. The agency was enabled by the adoption of the original Metropolitan Water District Act (MWD Act) by the California Legislature "for the purpose of developing, storing and distributing water for domestic purposes." The MWD Act also allows Metropolitan to sell "surplus water not needed or required for domestic or municipal uses within the district for beneficial purposes." In 1992, the Metropolitan Board of Directors adopted the following mission statement:

> *"To provide its service area with adequate and reliable supplies of high quality water to meet present and future needs in an environmentally and economically responsible way."*

The first function of Metropolitan was building the Colorado River Aqueduct (CRA) to convey water from the Colorado River. Deliveries through the aqueduct to member agencies began in 1941 and supplemented the local water supplies of the Southern California member cities. In 1960, to meet growing water demands in its service area, Metropolitan contracted for participation in the State Water Project (SWP), which is owned and operated by DWR and would deliver additional water supplies via the California Aqueduct. SWP deliveries began in 1972. Metropolitan currently receives imported water from both of these sources: (1) Colorado River water via the CRA, and (2) the SWP via the California Aqueduct.

Service Area

Metropolitan's service area covers the Southern California coastal plain. It extends about 200 miles along the Pacific Ocean from the city of Oxnard on the north to the international boundary with Mexico on the south, and it reaches as far as 70 miles inland from the coast (Figure 1-1). The total area served is approximately 5,200 square miles, and it includes portions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. Table 1-1 shows that although only 14 percent of the land area of the six Southern California counties is within Metropolitan's service area, approximately 86 percent of the populations of those counties reside within Metropolitan's boundaries.

Member Agencies

Metropolitan is currently composed of 26 voluntary member agencies, including 14 cities, 11 municipal water districts, and one county water authority. Metropolitan is a water wholesaler with no retail customers. It provides treated and untreated water directly to its member agencies.

Metropolitan's 26 member agencies deliver to their customers a combination of local groundwater, local surface water, recycled water, and imported water purchased from or exchanged with Metropolitan. For some member agencies, Metropolitan supplies most of the water used within that agency's service area, while others obtain varying amounts of water from Metropolitan to supplement local supplies. Between 2011 and 2020, Metropolitan has provided between 40 and 50 percent of the municipal, industrial, and agricultural water used in its service area. The remaining water supply comes from local wells, local surface water, recycling, and the city of Los Angeles' aqueducts from the Owens Valley/Mono Basin east of the Sierra Nevada. Member agencies also implement conservation and other programs that can be considered part of their supplies.

Some member agencies provide retail water service, while others provide water to the local area as wholesalers. Table 1-2 shows Metropolitan's member agencies and the type of service that they provide. As shown in the table, 15 member agencies provide retail service to customers, 9 provide only wholesale service, and 2 provide a combination of both. Throughout Metropolitan's service area, approximately 250 retail water suppliers directly serve the population.

Metropolitan's member agencies serve residents in 152 cities and 89 unincorporated communities. Table 1-3 shows the member agencies of Metropolitan, as well as the cities and communities served by those member agencies. Figure 1-1 also shows the geographical area served by the member agencies.

Currently, member agencies receive water from Metropolitan at various delivery points, and pay for service through a rate structure made up of multiple components. The majority of these components consist of uniform volumetric rates, and the majority of the revenue is collected through these volumetric rates. Metropolitan's pricing and rate structure are described in detail in Section 2.7.

To aid in planning future water needs, member agencies advise Metropolitan in July of each year of how much water they anticipate they will need during the next five years. In addition, Metropolitan works with its member agencies to forecast future water demands.

Board of Directors and Management Team

Metropolitan's Board of Directors currently consists of 38 directors. The Board consists of at least one representative from each member agency, with each agency's assessed valuation determining its additional representation and voting rights. Directors can be appointed by the chief executive officer of the member agency or be elected by a majority vote of the governing body of the agency. Metropolitan does not compensate directors for their service. The Board includes business, professional, and civic leaders. Board meetings are generally held on the second Tuesday of each month and are open to the public.

Throughout its history, the Board has delegated certain tasks to Metropolitan staff, which are codified in Metropolitan's Administrative Code. In addition, Metropolitan has developed policy principles to help achieve its mission to provide adequate and reliable supplies of high-quality water in an environmentally and economically responsible way. These policies can be found in a variety of documents including: specific policy statements, the Administrative Code, Board-adopted policy principles, and letters submitted to the Board. Policy statements are also embedded in formal Board meeting discussions and recorded in meeting minutes. The policies established by the Board are subject to all applicable laws and regulations. The management of Metropolitan is under the direction of its General Manager, who serves at the discretion of the Board, as do Metropolitan's General Auditor, General Counsel, and Ethics Officer.

1.3 Metropolitan Service Area Historical Information

Population

In 1990, the population of Metropolitan's service area was approximately 15.0 million people. By 2020, it had reached an estimated 19.0 million, representing almost half of the state's population. In the past, annual growth has varied from about 200,000 annually in the 1970s and early-to-mid-1980s to more than 300,000 annually in the late 1980s. Population growth slowed due to economic recession during the early 1990s to just over 50,000 in 1995, before again rising to more than 250,000 per year in the period 1999 through 2002. Growth has generally averaged 90,000 persons per year during the last 10 years from 2011-2020. Figure 1-2 shows the service area population growth from 1970 to 2020. From 2019 to 2020, the region experienced net decline in population due to the COVID-19 pandemic.

The most populated cities within Metropolitan's service area are Los Angeles (largest city in the state), San Diego (second largest in the state), Long Beach, Anaheim, Santa Ana, and Riverside. The Department of Finance State Population Report from May 2020 reports biggest numeric increases occurring in the cities of Los Angeles and San Diego, consistent with their larger population base. Figure 1-3 shows the 5-year growth rates for the six counties within Metropolitan’s service area. As can be seen from this figure, there has been an overall decrease in population growth rate in the last 5 years. Appendix 1 presents a detailed discussion of the demographic trends in Southern California and their impacts on regional demand forecasts.

In preparing its demographic and growth forecast, Metropolitan relied on Southern California Association of Government’s (SCAG’s) 2020 Demographics and Growth Forecast Proposed Final Technical Report to the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The report includes information on social factors affecting water management such as race, ethnicity, and cultures. As noted in SCAG’s report, Southern California is one of the most diverse regions in the nation in race and ethnicity. Race and ethnicity are important for demographers to consider while forecasting since fertility and household formation have strong cultural underpinnings that vary based on these categories.

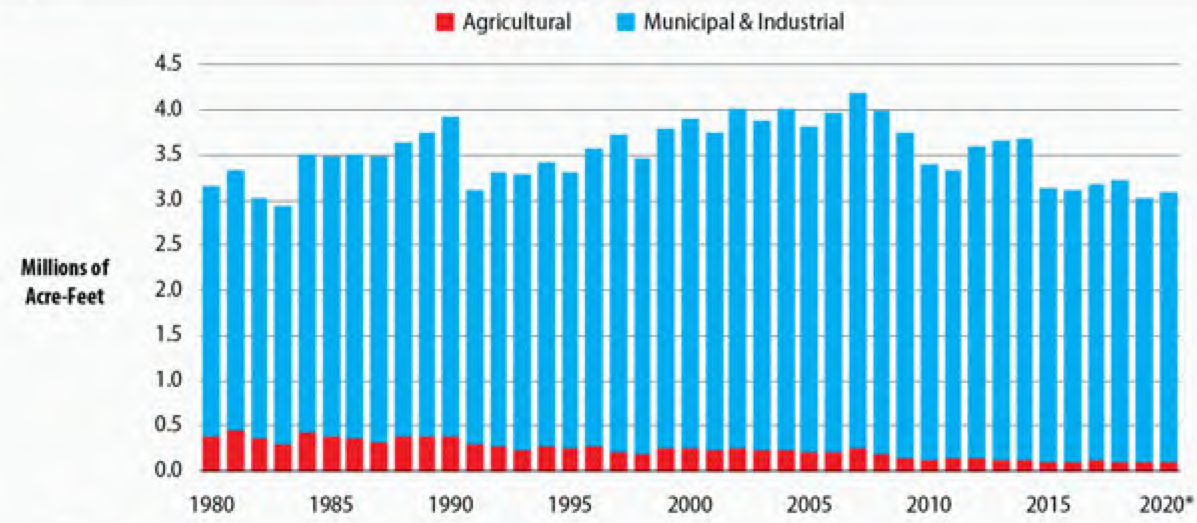
Historical Retail Water Demands

Figure 1-4 presents historical retail water demands on a calendar year basis in Metropolitan's service area. Since 1980, retail water demands varied from 2.9 million acre-feet (MAF) in 1983 to nearly 4.2 MAF in 2007. Following record demand in 1990 of over 3.9 MAF, due to the economic recession, drought impacts, conservation, and mandatory water use restrictions, demands declined to 3.1 MAF in 1991. Demand remained below the historic peak level as a result of continuing effects from the recession and the drought, coupled with a number of wet years and ongoing conservation efforts. In 2000, retail demands once again reached 3.9 MAF, reaching the early peak level for the first time in a decade. Since 2000, retail demands reached a new peak level in 2007 with nearly 4.2 MAF. Calendar year 2007 was the driest year since 1989, with precipitation measured at 5.66 inches in Downtown Los Angeles. Since the peak retail demand in 2007, a decrease in demand was observed during the economic recession of 2008-2012. Starting in 2012, the severe drought in California led to a massive conservation campaign and water use restriction by the State, Metropolitan, and local water agencies resulting in a decrease in demand in 2015. Demands remain low even after the mandatory restriction was lifted in the spring of 2017.

In 2020, about 96 percent of retail demands were used for municipal and industrial purposes (M&I), and 4 percent for agricultural purposes. The relative share of agricultural water use has declined due to urbanization and market factors, including the price of water. Agricultural water use accounted for 19 percent of total regional water demand in 1970, 12 percent in 1980, 10 percent in 1990, and 4 percent in 2010.

Figure 1-4 Retail Demand in Metropolitan's Service Area



*Data not available. 2020 estimated based on historical data.

Climate and Rainfall

As Figure 1-5 shows, Metropolitan's service area encompasses three major climate zones. Table 1-4 reports the average temperature and rainfall information for representative locations within those three zones for the 30-year period from 1990 to 2019. The evapotranspiration data (expressed as Et_o) are reported for the 30-year period of 1985 to 2014.

1.4 Current Conditions

Current Challenges

Metropolitan faces a number of challenges in providing adequate, reliable, and high-quality supplemental water supplies for southern California. One of those challenges is widely variable hydrologic conditions that can have a significant impact on Metropolitan's imported water supply sources. This section offers a brief discussion of Metropolitan's current challenges, current available resources, short-term supply outlook, and recent and near-term actions to meet these challenges.

Dramatic swings in annual hydrologic conditions have characterized the past decade on the State Water Project (SWP). 2014 saw the lowest allocation of contract supplies from the SWP up to that point, and 2015 saw the lowest ever Northern Sierra snowpack. Just two years later in 2017, the SWP watershed experienced the highest ever Sacramento River runoff, and the highest SWP allocation since 2006. Wet conditions returned in 2019, helping Metropolitan to build dry-year storage reserves to record high levels. Dry conditions have returned in 2020. The year began with a dry January and the driest February on record. In addition to below average precipitation, the snowpack peaked in April at only 66 percent of the April 1 average measurement. This dry hydrology produced only 52 percent of average runoff for the water year. As a result, Metropolitan only received 20 percent of its contract water supplies in 2020. For calendar year 2021, the SWP allocation decreased from an initial allocation of 10 percent to five percent based on on-going dry conditions. The five percent SWP allocation for Metropolitan in 2014 and 2021 represents the lowest in the history of the SWP.

The Colorado River Basin has also historically experienced large swings in annual hydrologic conditions; however, these swings have largely been buffered through a large volume of storage. In 2020, the Upper Colorado River Basin snowpack peaked in April at 107 percent of average. However, April through July runoff was observed at just 52 percent of average due to hot and dry conditions in the late spring and early summer. This is an example of a potential change in relationship between precipitation and expected runoff. The Colorado River Basin experienced 5 consecutive years of significantly below average runoff starting in 2000, followed by a period of alternating years of above average, near average, and significantly below average runoff through 2020. This 21-year period has been mitigated by actions taken by Metropolitan in cooperation with the Bureau of Reclamation and the other Basin States to maintain system storage, avoiding a shortage declaration. At the close of 2020, however, system storage is at or near its lowest since 2000, so there is less water available to buffer future dry conditions.

Sacramento-San Joaquin River Delta Issues

The Sacramento-San Joaquin River Delta (Bay-Delta) is the hub of California's water supply and is critically important to the entire state. About 30 percent of Southern California's water supply moves across the Bay-Delta. The Bay-Delta's declining ecosystem, caused by a number of factors that include agricultural runoff, predation of native fish species, urban and agricultural discharge, changing ecosystem food supplies, and overall system operation, has led to reduction in water supply deliveries. Operational constraints will likely continue until a long-term solution to the problems in the Bay-Delta is identified and implemented.

Delta Conveyance

In his State of the State address delivered February 12, 2019, Governor Newsom announced that he did not "support WaterFix as currently configured," but does "support a single tunnel." On April 29, 2019, Governor Newsom issued Executive Order N-10-19, directing several agencies to (among other things), "inventory and assess… [c]urrent planning to modernize conveyance through the Bay Delta with a new single tunnel project." The Governor's announcement and Executive Order led to DWR's withdrawal of all approvals and environmental compliance documentation associated with California WaterFix. The CEQA process identified in this notice for the proposed Delta Conveyance Project will, as appropriate, utilize relevant information from the past environmental planning process for California WaterFix, but the proposed project will undergo a new stand-alone environmental analysis leading to issuance of a new EIR.

On January 15, 2020, DWR issued a Notice of Preparation of an Environmental Impact Report for the DCP. The proposed project would construct and operate new conveyance facilities in the Delta that would add to the existing SWP infrastructure. New intake facilities as points of diversion would be located in the north Delta along the Sacramento River between Freeport and the confluence with Sutter Slough. The new conveyance facilities would include a single main tunnel to convey water from the new intakes to the existing Banks Pumping Plant and potentially the federal Jones Pumping Plant in the south Delta. The new facilities would provide an alternate location for diversion of water from the Delta and would be operated in coordination with the existing south Delta pumping facilities. The new north Delta facilities would be sized to convey up to 6,000 cfs of water from the Sacramento River to the SWP facilities in the south Delta. DWR would operate the dual conveyance system in compliance with all state and federal regulatory requirements and would not reduce DWR's current ability to meet standards in the Delta to protect biological resources and water quality for beneficial uses.

2019 Biological Opinions

In August 2016, USBR and DWR reinitiated consultation with NMFS and USFWS on the Coordinated Long-term Operations of the CVP and SWP due to new information and science on declining listed fish species populations. On October 21, 2019, USFWS and NMFS released their Biological Opinions, and on February 18, 2020, USBR signed a Record of Decision, pursuant to the National Environmental Policy Act, completing its environmental review and adopting the 2019 Long-Term Operations Plan.

The 2019 Long-Term Operations Plan incorporates and updates many of the requirements contained in the previous 2008 and 2009 Biological Opinions. It also includes over $1 billion over a ten-year period in conservation, monitoring and new science, some of which is in the form of commitments carried forward from the previous 2008/2009 Biological Opinions. Those costs are shared by the SWP and CVP. The 2019 Long-Term Operations Plan and 2019 Biological Opinions are expected to increase SWP deliveries by an annual average of 200,000 acre-feet as compared to the previous Biological Opinions.

California ESA Incidental Take Permit

DWR described and analyzed its proposed SWP long-term operations plan for purposes of obtaining a new California ESA permit in its November 2019 Draft EIR. The 2019 Draft EIR proposed essentially the same operations plan as the federal 2019 Biological Opinions, with the addition of operations for the California ESA-listed Longfin smelt. The proposed project included an estimated $540 million in conservation, monitoring and science, much of which overlapped with DWR's share of the estimated $1 billion under the federal 2019 Biological Opinions. In December 2019, DWR submitted its application for an incidental take permit under the California ESA to the California Department of Fish and Wildlife (CDFW), with a modified State operations plan that added new outflow and environmental commitments. On March 27, 2020, DWR released its final EIR and Notice of Determination, describing and adopting a State operations plan with additional operational restrictions and additional conservation commitments. On March 31, 2020, CDFW issued a California ESA incidental take permit for the SWP that included further operational restrictions and outflow. The final approved project and incidental take permit reduce long-term average SWP deliveries by more than 200 TAF, which more than erased any potential improvement in SWP water supplies that were anticipated to result from the 2019 Biological Opinions. In addition, the approved project and incidental take permit add another estimated $218 million over a ten-year period in environmental commitments for the SWP beyond the SWP's share of the $1 billion required to comply with the 2019 Biological Opinions.

<u>Bay-Delta Water Quality Control Plan Update/Voluntary Agreements</u>

The Bay-Delta Plan is reviewed periodically, and new standards and allocations of responsibility can be imposed on the SWP as a result. The last review was completed in 2006, and the current review has been ongoing since approximately 2010 in a phased approach.

Phase 1 focuses on the southern Delta salinity objectives for the protection of agriculture, San Joaquin River flow objectives for the protection of fish and wildlife, and a program of implementation for achieving those objectives. Phase 2 considers the comprehensive review of the other elements of the Bay-Delta Plan, including but not limited to Sacramento River and Delta outflow objectives.

The SWRCB has also encouraged all stakeholders to work together to reach one or more voluntary agreements for consideration by the SWRCB that could implement the proposed amendments to the Bay-Delta Plan through a variety of tools, while seeking to protect water supply reliability. Metropolitan is participating in the Phase 2 proceedings and voluntary agreement negotiations. In March of 2019, DWR and CDFW put forward a project description and planning agreement that would allow the SWRCB to analyze the environmental impacts and benefits of the voluntary agreement alternative to the percentage of unimpaired flow framework.

In December 2018, the SWRCB adopted the Phase 1 Bay-Delta Plan amendments and Final Substitute Environmental Document. Among other things, the Phase 1 updates established new Lower San Joaquin River (LSJR) flow objectives and revised southern Delta salinity objectives. In July of 2018, the SWRCB released a framework that describes the draft proposal for Phase 2, which will update the flow requirements for the Delta and its contributing watersheds, including the Sacramento River and its tributaries. The framework provides additional details about the flow requirements staff is likely to propose, how these new requirements could be implemented, and preliminary information on their potential environmental benefits and water supply effects. The framework also states that the SWRCB is interested in receiving potential Bay-Delta Plan amendment language developed through the voluntary agreement process that would authorize, with the affirmative concurrence from CDFW, a coordinated control of flows and other, non-flow factors that would achieve benefits comparable to the unimpaired flow requirements.

Other issues, such as the continued decline of some fish populations in the Bay-Delta and surrounding regions and certain operational actions in the Bay-Delta, may significantly reduce Metropolitan's water supply from the Bay-Delta. Future new or revised Biological Opinions or incidental take authorizations under the Federal ESA and California ESA might further adversely affect SWP and CVP operations. Additionally, new litigation, listings of additional species under the ESAs, or new regulatory requirements imposed by the SWRCB could further adversely affect SWP operations in the future by requiring additional export reductions, releases of additional water from storage, or other operational changes impacting water supply operations. Metropolitan cannot predict the ultimate outcome of any of the litigation or regulatory processes described above, but believes they could have an adverse impact on the operation of the SWP pumps, Metropolitan's SWP supplies, and Metropolitan's water reserves.

Operational constraints likely will continue until a long-term solution to the problems in the Bay-Delta is identified and implemented. The Delta Vision process, established by Governor Schwarzenegger, was aimed at identifying long-term solutions to the conflicts in the Bay-Delta, including natural resource, infrastructure, land use, and governance issues. In addition, State resource agencies and various water user entities are currently engaged in the development of the Delta Conveyance Project, which is aimed at making physical and operational improvements to the SWP system in the Delta necessary to restore and protect access south-of-Delta SWP water supplies and restore and protect water quality by addressing anticipated sea-level rise, seismic risks, and by providing operational flexibility to improve aquatic conditions in the Delta and better manage risks of further regulatory constraints on SWP operations.

Water Supply Conditions

The water conditions that the region faced leading up to 2020 were characterized by alternating scarcity and abundance. Whereas the five years leading up to the prior UWMP were characterized by severe drought and depletion of Metropolitan's dry year storage reserves, conditions leading up to 2020 have included two very wet years and the rebuilding of Metropolitan's storage reserves to record high levels.

The five-year period began with 2016 reflecting average hydrologic conditions and a 60 percent SWP allocation. This level of supplies allowed for a modest recovery in storage reserves after the drought of 2014-2015. The wettest year on record followed in 2017, and with an 85 percent SWP allocation, Metropolitan was able to add over a million acre-feet to storage reserves by the end of 2017. As such, Metropolitan was well prepared to manage a future dry year, which arrived in 2018 with a 35 percent allocation. Wet conditions returned in 2019; with a 75 percent allocation, storage reserves increased by nearly 600 TAF, ending the year at a record high 3.1 MAF. With high volumes of water in storage, and healthy supplies on the Colorado River, Metropolitan was well prepared to meet the challenge of a dry 2020 and 20 percent SWP allocation.

Investments in storage and flexible operations have prepared Metropolitan to capitalize on available supplies in wet years and manage through drought years. During the wet years of 2017 and 2019, Metropolitan achieved the following milestones:

- In 2017, record deliveries of 395 TAF to exchange partners Desert Water Agency and Coachella Valley Water District from the Colorado River Aqueduct to accomplish the largest single year increase in the Advance Delivery Account;
- In 2017 and 2019, record creation of Intentionally Created Surplus storage in Lake Mead of 351 TAF and 410 TAF, respectively; and
- In 2019, a record low diversion of Colorado River water of approximately 540 TAF, a level not seen since the 1950s.

While recent wet conditions along with flexible adaptive management have brought great successes in building storage reserves, water supply challenges remain. These include:

- Analysis of historical records suggest a potential change in the relationship between precipitation and runoff in the Colorado River Basin and has contributed to a drying trend over the last 21 years. With Lake Mead and Lake Powell at 40 and 42 percent of capacity, respectively, there is practically no buffer to avoid a shortage from any future period of reduced precipitation and runoff.
- Groundwater basins and local reservoirs dropped to very low operating levels due to record-dry hydrology in Southern California in 2016. Due to wetter hydrology in 2017 and 2019, the groundwater basins started to recover. However, levels in groundwater basins throughout

the service area remained below healthy storage levels. In addition, groundwater production in the service area has remained at low levels even after the drought;

- Supply availability in the Los Angeles Aqueduct system continues to be affected by both drought and environmental mitigation efforts related to Owens Lake and the Lower Owens River.

In addition, water quality challenges such as algae toxins, PFAS, and the identification of constituents of emerging concern, have a significant impact on the region's water supply conditions and underscore the importance of flexible and adaptive regional planning strategies.

Current Available Resources

Metropolitan's primary purpose is to provide a supplemental supply of water for domestic and municipal uses at wholesale rates to its member public agencies. Metropolitan's principal sources of water are the SWP and the Colorado River. Metropolitan's robust planning strategy continues to balance available local and imported water resources and member agencies' demands within Metropolitan's service area.

A. Imported Supplies

Metropolitan receives water from the Colorado River through the Colorado River Aqueduct (CRA) and from the SWP through the California Aqueduct. Figure 1-6 shows the historic annual deliveries from the SWP and the Colorado River.

Colorado River

The Colorado River was Metropolitan's original source of water after Metropolitan's establishment in 1928. Metropolitan has a legal entitlement to receive water from the Colorado River under a permanent service contract with the Secretary of the Interior. The CRA, which has a capacity of 1.25 MAF a year, is owned and operated by Metropolitan. It transports water from Lake Havasu, at the border of the state of California with Arizona, approximately 242 miles to its terminus at Lake Mathews in Riverside County.

Over the years, Metropolitan increased reliable supply through the CRA through programs that it helped fund and implement including: farm and irrigation district conservation programs, improved reservoir system operations, land management programs, and water transfers and exchanges through arrangements with agricultural water districts in southern California, entities in Arizona and Nevada that use Colorado River water, and the U.S. Department of the Interior, Bureau of Reclamation (USBR). A detailed discussion of availability of Colorado River water for delivery to Metropolitan is included in Section 3.1.

Metropolitan also receives approximately 277,700 AF per year of additional Colorado River supplies pursuant to an exchange agreement with its member agency, San Diego County Water Authority (SDCWA) (the Exchange Agreement). Pursuant to several agreements, SDCWA receives transfers of Colorado River water from Imperial Irrigation District (IID) and water resulting from the Coachella Canal Lining Project and All-American Canal Lining Project. Pursuant to the Exchange Agreement with Metropolitan, SDCWA makes that water available to Metropolitan at Lake Havasu, which Metropolitan then adds to its supplies. In exchange, Metropolitan delivers a like-amount of its own blended water to SDCWA at the Metropolitan-SDCWA connections.[1]

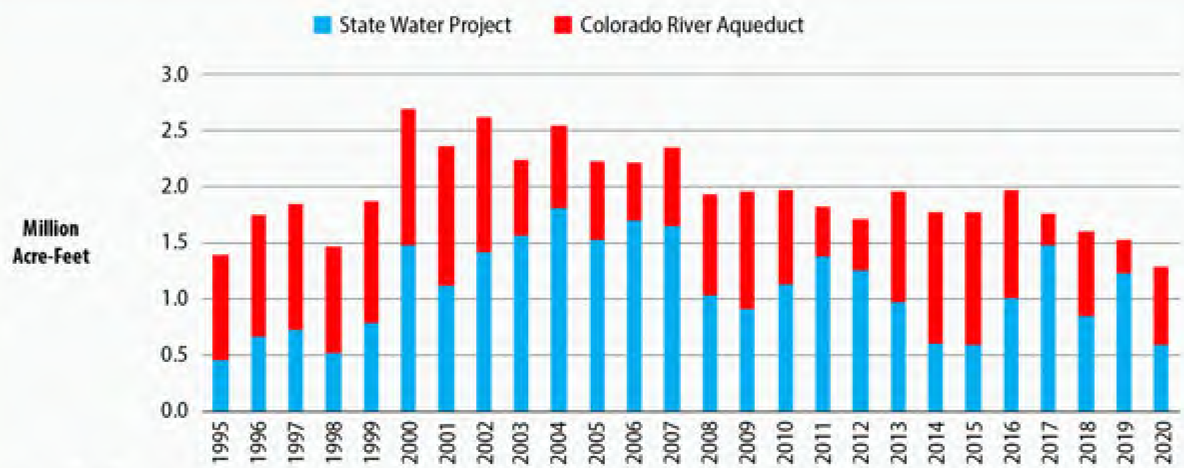
<u>State Water Project</u>

Metropolitan imports water from the SWP, owned by the state of California and operated by DWR. This project transports Feather River water stored in and released from Oroville Dam and conveyed through the Bay-Delta, as well as unregulated flows diverted directly from the Bay-Delta south via the California Aqueduct to four delivery points – one from the Aqueduct's West Branch at the northwestern and three from the East Branch at the northeastern portion of Metropolitan's service area.

In 1960, Metropolitan signed a water supply contract with DWR for participation in the SWP (State Water Contracts). Metropolitan is one of 29 agencies that have long-term contracts with DWR (State Water Contractors) that are participants in the SWP through State Water Contracts, and is the largest agency in terms of the number of people it serves (19.2 million), the share of SWP water that it is allocated pursuant to the State Water Contract (approximately 46 percent), and the percentage of total annual payments made to DWR by agencies with State Water Contracts (approximately 53 percent in 2020). A more detailed discussion of the SWP supplies is provided in Section 3.2.

[1] Prior UWMPs reported these exchanges as SDCWA's local supplies and not as Colorado River water made available to Metropolitan at Lake Havasu with Metropolitan's other Colorado River supplies. This was because Metropolitan reported information in the UWMP as reported by each member agency and SDCWA reported the exchanges as local supplies. Metropolitan has determined that it is most appropriate to report the exchanges here consistently with the transaction, pursuant to Water Code Section 10615. Section 10615 requires that Metropolitan describe and evaluate all sources of supply made available to the district. SDCWA has independently acquired the IID transfer water pursuant to its transfer agreement with IID, and Metropolitan assigned to SDCWA its rights to the canal lining water for 110 years. Under the Colorado River Water Delivery Agreement, the Secretary of the Interior has agreed to deliver this conserved Colorado River water to the Colorado River Aqueduct Intake at Lake Havasu for diversion by Metropolitan. Metropolitan and SDCWA executed the 2003 Exchange Agreement providing for Metropolitan to take possession of the water at Lake Havasu. Metropolitan owns and manages this water at its complete discretion for the benefit of its member agencies. In exchange for the volume made available to Metropolitan at Lake Havasu (at uneven intervals), Metropolitan delivers annually an equal volume to SDCWA (in even monthly deliveries) from whatever source or sources available to Metropolitan. Accordingly, other Metropolitan reports, including the Integrated Water Resources Plan (IRP) and the Annual Report, have accurately not categorized that water as "local supplies." To reflect the transfer of the Colorado River water to Metropolitan at Lake Havasu for its ownership and management, the exchange water is categorized here as water imported from the Colorado River pursuant to the Exchange Agreement and not as a local supply. This is consistent with Section 10615's requirement, and is also consistent with Metropolitan's prior report of the SDCWA exchange water at Section 3.1 of the UWMP and its exclusion from the local supplies at Figure 1-7 of prior UWMP reports.

Figure 1-6 Imported Water Supplies in Metropolitan's Service Area



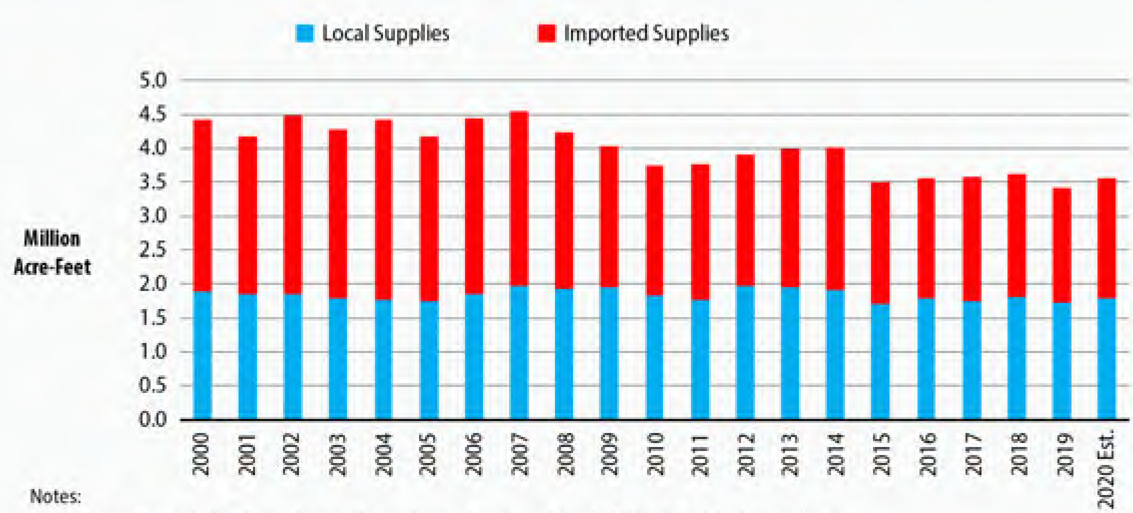
Notes:

1. State Water Project Supplies include Table A, Art. 21, Art. 14(b), Art. 12(d), Art. 12(e), Art. 55, draws from storage & carryover, DWCV & other exchanges, transfers, Drought Water Bank and Dry Year Pool Purchases, Pools A&B, Flood Water, wheeling, Port Hueneme lease, and SBVMWD Purchases.
2. Colorado River Aqueduct supplies are gross Havasu diversions less return flows, deliveries to USBR, Mexico, and storage.

B. *Local Supplies*

Approximately 50 percent of the region's water supplies come from resources separately controlled or operated by local water agencies. These resources include water extracted from local groundwater basins, catchment of local surface water, and non-Metropolitan imported water supplied through the Los Angeles Aqueduct. Figure 1-7 shows the historic annual use of local and imported water supplies within Metropolitan's service area.

Figure 1-7 Annual Regional Water Supplies in Metropolitan's Service Area



Notes:

1. Local supplies include: Groundwater, Groundwater Recovery, Recycled Water, and Surface water
2. Imported supplies include: Full-service, IAWP, Replenishment and LAA
3. Data not available for 2020. Estimate for 2020 is based on historical data.

Groundwater

The groundwater basins that underlie the region provide an annual average supply of approximately 1.2 MAF (2011-2020 average). Natural recharge of the groundwater basins is supplemented by active recharge of captured stormwater, recycled water, and imported water to support this level of annual production.

Estimates indicate that available storage space in the region's groundwater basins in mid-2020 is approximately 4.7 MAF. Successive dry years have resulted in groundwater depletions that will need to be replaced with natural recharge during wet years and active spreading of captured stormwater, recycled water, and imported water. Groundwater basin managers and water suppliers have taken steps to store water in advance of dry years to soften the potential impact on groundwater aquifers and to maintain reliable local water supplies during dry years.

Recycling, Groundwater Recovery, and Seawater Desalination

Recycling and groundwater recovery are local resources that add balance to Southern California's diverse water portfolio. In addition to replenishment of groundwater basins as described above, water recycling provides extensive treated wastewater for applicable municipal and industrial uses. Common uses of recycled water include landscape irrigation, agricultural irrigation, and commercial and industrial applications. Groundwater recovery employs additional treatment techniques to effectively use degraded groundwater supplies that were previously not considered viable due to high salinity or other contamination.

While water recycling and groundwater recovery projects in the Southern California region are primarily developed by local water agencies, many newer projects have been developed with financial incentives provided through Metropolitan's Local Resources Program (LRP). The LRP is a performance-based program that provides incentives to expand water recycling and support recovery of degraded groundwater, among other types of projects. In 2020, the regional water production from water recycling and groundwater recovery totaled approximately 552 TAF, of which 120 TAF was developed with Metropolitan funding assistance. A detailed discussion of recycling and groundwater recovery is presented in Section 3.5.

Seawater desalination represents a significant opportunity to diversify the region's water resource mix with a new, locally controlled, reliable potable supply. Metropolitan supports seawater desalination to its member agencies by providing technical assistance, regional facilitation of research and information exchanges, and financial incentives through the LRP.

In December 2015, pursuant to its Water Purchase Agreement with the San Diego County Water Authority (SDCWA), Poseidon Resources began operation of the 56 TAF Claude "Bud" Lewis Seawater Desalination Plant in the City of Carlsbad. During fiscal years 2017 through 2019, the facility produced an annual average of 42.1 TAF, meeting nearly 9 percent of SDCWA's service area demands. The Carlsbad facility does not receive funding through Metropolitan's LRP. Seawater desalination is discussed in more detail in Section 3.5

Surface Water

In addition to the groundwater basins, local agencies maintain surface reservoir capacity to capture local runoff. The average yield captured from local watersheds is estimated at approximately 90 TAF per year (2011-2020 average). The majority of this supply comes from reservoirs within the service area of the SDCWA.

Los Angeles Aqueduct

Although the Los Angeles Aqueduct (LAA) imports water from outside the region, Metropolitan classifies water provided by the LAA as a local resource because it is developed and imported by a local agency (the Los Angeles Department of Water and Power). This resource provided approximately 200 TAF per year on average over the last ten years from 2011 to 2020 but was reduced to approximately 33 TAF during a historic dry period of 2015.

Table 1-5 shows the projected local supplies estimated for a normal water year and under five consecutive years of drought for 2025, 2035, and 2045.

Table 1-5
Local Supplies for Normal and Dry Years
(Acre-Feet)

	2025		2035		2045	
	Normal Year[1]	Dry Year[2]	Normal Year	Dry Year	Normal Year	Dry Year
Local Groundwater						
From Natural Recharge[3]	939,000	985,000	964,000	988,000	991,000	1,011,000
Replenishment	316,000	255,000	332,000	327,000	335,000	334,000
Local Projects						
Groundwater Recovery	143,000	139,000	158,000	158,000	159,000	159,000
Recycling	550,000	491,000	687,000	658,000	706,000	703,000
Seawater Desalination	51,000	56,000	51,000	56,000	51,000	56,000
Local Runoff Stored	80,000	77,000	82,000	77,000	82,000	77,000
Los Angeles Aqueduct	257,000	118,000	258,000	118,000	258,000	118,000
Exchange with SDCWA	278,000	278,000	278,000	278,000	278,000	278,000
Total	**2,613,000**	**2,400,000**	**2,809,000**	**2,660,000**	**2,860,000**	**2,736,000**

[1] Normal Water Year is based on 1922 through 2017.

[2] Dry Year is based on five consecutive years of drought (1988-92).

[3] Estimate of natural recharge is based on basin balance considering projected local groundwater production and replenishment deliveries to the groundwater basins.

Metropolitan's Actions to Address Supply Challenges

Metropolitan progressively addressed the challenges of water shortages caused by the dramatic swings in annual hydrologic conditions that have characterized the past decade on the SWP. Metropolitan took actions that include: (1) Increasing water conservation by expanding outreach, adding devices, and increasing incentives to residents, (2) Increasing local resources by providing incentives for on-site recycled water hook-up and increasing incentives for the LRP, (3) Augmenting water supplies through water transfers and exchanges, (4) Improving return capability of storage programs, (5) Modifying Metropolitan's distribution system to enhance the use of Colorado River water, and (6) Implementing the Water Supply Allocation Plan to distribute the limited imported supplies and preserve storage reserves.

Continuing Water Conservation

By 2040, conservation and water recycling will account for one-third of Southern California's water supply portfolio in Metropolitan's service area. Metropolitan supports financial incentives, education, outreach programs and appliance/plumbing standards at both the regional and local level to ensure water conservation meets this goal.

On April 1, 2015, Governor Brown issued an Executive Order (Order) calling for a 25 percent reduction in consumer water use in response to the historically dry conditions throughout the State of California. The next month, Metropolitan increased funding for its conservation program to a record amount of $450 million over the next two fiscal years due to strong response to the incentive program and to assist retail agencies in the service area to meet their mandatory water reduction targets. Since the drought ended, Metropolitan has been working hard these past five years to ensure that water demand in its service area continues to remain low. Gallons per capita measurement is the major conservation indicator of residential water demand, and for the last five years, Metropolitan's service area has remained below the theoretical standard set to meet a 20 percent reduction goal by 2020. While Metropolitan is not subject to meeting the requirements of California's 20X2020 Water Conservation Plan, its conservation efforts are designed to help its member agencies and their retailers to meet their requirements.

Metropolitan's conservation program has seen numerous changes from the previous years of record high conservation activity during the last drought, as focus shifted from relying heavily on providing incentives to developing additional training and research programs to supplement conservation activity. This new focus was designed to reach a broader audience in order to maintain water demand levels achieved during the recent drought. The educational courses teach students the numerous benefits of water efficient landscaping and how to convert their traditional landscaped yards to something more appealing and sustainable, while greatly reducing their outdoor water usage. Ongoing educational efforts include turf removal, California Friendly native plants and landscaper training classes. Additionally, Metropolitan is searching for other water saving opportunities by researching the potential of water saving processes in cooling tower water use, the effects on household water pressure reduction on residential water use, and a household water demand pilot study to determine residential end use from water using fixtures.

Recent conservation highlights include the launching of a revised Turf Replacement Program, establishing additional water efficiency incentives with energy utilities, and a new program for increasing conservation in disadvantaged communities. The disadvantaged community program is comprised of three parts: (1) a regional pilot program; (2) increased flexibility for member agencies to use Metropolitan funds for member agency-administered programs; and, (3) grant funding support. The $3 million regional pilot program provides $250 for installation of premium high-efficiency toilets within multi-family housing constructed prior to 1994. Analyzing program data may better explain how regional approaches could increase conservation within disadvantaged communities. Under the second component, 100 percent of the Metropolitan funds given to member agencies for their locally administered conservation programs could be targeted toward supporting disadvantaged communities or income-qualified consumers. Metropolitan also works with member and local agencies to help identify opportunities and procure grant funding for such conservation programs

Increasing Local Resources

Since 1982, Metropolitan has assisted local agencies in the development of water recycling and groundwater recovery under the Local Resources Program (LRP). The LRP has evolved over time in an effort to help support the development of local supply projects including the methodology for providing the incentives to the Member Agencies. In October 2014, Metropolitan's Board approved additional LRP refinements to support further development of local resources, which included increasing the maximum incentive amount, offering three incentive payment structures, including on-site recycled water retrofit costs, including other water resources (such as seawater desalination and stormwater), and providing reimbursable services for Metropolitan's technical assistance.

On-site Retrofit Program

In February 2014, Metropolitan's Board approved the On-site Retrofit Pilot Program to offer incentives to modify existing water users' potable water or industrial water systems to utilize recycled water.

Stormwater Pilot Programs

In September 2019, Metropolitan's Board approved the Stormwater for Direct-use Pilot Program to offer incentives for development and monitoring of new and existing direct-use stormwater projects. The primary purpose of the Pilot Program is to collect data from several region-wide stormwater projects. The data collected will provide a better understanding of actual stormwater runoff capture volumes, costs, and project performance. The Pilot Program will help evaluate the potential water supply benefits delivered by stormwater capture projects and provide a basis for potential future funding approaches.

In November 2019, Metropolitan's Board approved the Stormwater for Recharge Pilot Study. The purpose of this study is to evaluate the relationship between stormwater capture and yield to define the water supply benefits of stormwater. Yield for purposes of this study is defined as either increased groundwater production or decrease in imported water needs relative to baseline. The study also requires a minimum of 3 years of monitoring, both of the amount of stormwater captured and the impact to the groundwater basins via groundwater modeling and monitoring wells or sensors. This study will help evaluate the potential water supply benefits delivered by stormwater capture projects and provide a basis for potential future funding approaches.

Augmenting Water Supplies

Augmenting water supplies through water transfers and exchanges is an element of Metropolitan's IRP to mitigate water shortages during dry periods.

The Colorado River System has experienced a drying trend since 2000, leading to substantially decreased water levels in both Lakes Mead and Powell. In March 2014, Metropolitan's Board approved entering into an agreement with the Central Arizona Water Conservation District, Denver Water, Southern Nevada Water Authority (SNWA), and the United States to establish a two-year pilot program to compensate entitled users of the Colorado River water for voluntary reductions in water use, including fallowing of agricultural lands. The water savings from this program became system water and supported lake elevations.

Metropolitan also entered into several agreements to improve Metropolitan's operational flexibility on both a short-term and mid-term basis:

- In January 2015, Metropolitan's Board authorized an exchange of up to 50 TAF with Westside Mutual Water Company and Kern County Water Agency. This one-for-one exchange provides water at a time in the year when SWP supplies are expected to be low and provides flexibility on timing of returning water.
- In September 2015, Metropolitan's Board authorized an amendment to the operational storage agreement with SNWA and the Colorado River Commission of Nevada allowing

Metropolitan access to additional Colorado River water during 2015. Metropolitan paid SNWA $44.375 million for 150 TAF of water apportioned to but not used by SNWA during 2015. When SNWA requests return of water stored under this amendment, SNWA would reimburse Metropolitan for the costs paid for the initial delivery of water.

- In November 2015, Metropolitan's Board authorized entering into agreements with Antelope Valley-East Kern Water Agency (AVEK) to develop exchange and storage programs for SWP supplies. This would be an uneven exchange: for every two acre-feet provided to Metropolitan, AVEK would receive back one acre-foot in the future. Metropolitan may also store at least 30 TAF of its SWP supplies in wet years in the Antelope Valley groundwater basin.
- In September 2020, Metropolitan's Board authorized new price terms for the purchase of transfer supplies under the Yuba Accord. The price terms will be fixed for the next five years. Metropolitan has received around 200 TAF of new supplies before losses under the program.
- In March 2021, Metropolitan's Board authorized entering into an agreement with San Bernardino Valley Municipal Water District to obtain surplus SWP supplies. The program provides improved water supply reliability to Metropolitan and Metropolitan's member agencies within the Santa Ana River Watershed. The program is estimated to provide a long term average of around 13 TAFY to the region.

Improving Return Capabilities of Storage Programs

Metropolitan has a number of storage programs with water agencies along the California Aqueduct that would allow it to store SWP supplies during surplus conditions and to have stored water returned when needed. In 2015, Metropolitan provided up-front capital costs to its water management program partners to build infrastructure to improve the return capabilities of several storage programs.

- In September 2014, Metropolitan's Board authorized providing capital funds to Semitropic Water Storage District to enhance the pumpback capacity of the Semitropic Groundwater Storage Program by 13,200 AFY. The capital costs would be reimbursed to Metropolitan should Semitropic market the added capacity to another party after Metropolitan has at least one year of recovery capability.
- In March 2015, Metropolitan's Board authorized entering into agreement with Arvin Edison Water Storage District to restore 2,500 AFY of return capability by replacing groundwater wells of the Arvin Edison/Metropolitan Water Management Program. The capital costs will be reimbursed as credits to future Program costs.
- Also, in March 2015, Metropolitan's Board authorized entering into agreement with Kern-Delta Water District to improve the return reliability of the Kern-Delta Water District Water Management Program. The improvement includes a pipeline that would reduce losses when Kern River supplies are delivered for exchange. Metropolitan's upfront costs will be more than offset through an elimination of put regulation fees on the next 20,000 AF delivered into the Program.
- In April 2019, Metropolitan's Board authorized entering into an agreement with AVEK for the High Desert Water Bank. Under the Water Bank, Metropolitan could store up to 280,000 acre-feet (AF) of its State Water Project (SWP) Table A or other supplies in the Antelope Valley groundwater basin. Metropolitan will have first priority to 70,000 AF per year of both put and take capacity. Metropolitan will pay AVEK for the capital costs for construction of monitoring and production wells, turnouts from the California Aqueduct, underground and aboveground pipelines, recharge basins, water storage, and booster pump facilities. In

addition, Metropolitan would subsequently pay actual operation and maintenance, energy, and recovery usage fees to recover the water in storage.

Modifying Metropolitan's Distribution System

As a result of ongoing extraordinary dry conditions throughout the state of California, the SWP allocation for calendar year 2014 was five percent, which represents about 96,000 acre-feet of SWP Table A water allocation for Metropolitan. Although Metropolitan had been utilizing storage reserves to help bridge the gap between the low SWP supplies and its demand for SWP water, a number of extraordinary operational actions were taken in 2014 to use available Colorado River water and DVL storage supplies to deliver water service to areas where Metropolitan ordinarily uses SWP supplies to provide its service.

Metropolitan modified its normal operations in several areas of the system to use Colorado River water to provide service to areas as far west as the cities of Thousand Oaks and Calabasas, as well as other locations within Metropolitan's system, some of which had not received Metropolitan water from the Colorado River for extended periods since the completion of the SWP in the early 1970s. System modifications have also been implemented to increase system flexibility to use Colorado River water and DVL water for service to new areas of the system.

- In April 2014, Metropolitan's Board authorized a project that would allow Metropolitan to serve water from multiple sources, such as DVL, to the Mills Treatment Plant in Riverside. The initial phase, construction of an interconnect between the Inland Feeder and the Lakeview Pipeline, near San Jacinto, California, was completed in October 2014, which allowed for an initial flow of water. The second phase of the project, lining of the Bernasconi Tunnel No. 2 was completed in March of 2015 and allowed for increased flows from DVL. The final phase of the project, installation of 3 large valves to improve flow control was completed in 2018.
- In May 2014, Metropolitan's Board authorized the design of improvements to the Greg Avenue Pump Station to enhance water supply reliability in the West Valley area and construct flow control modifications to the outlet of the Jensen Water Treatment Plant. These projects currently allow the West Valley area and Ventura County, which is served normally with SWP water only, to receive blended supplies from the SWP and the Colorado River. Construction of the Greg Avenue Pump station improvements to enhance the long term reliability of the pumps was authorized in February 2019 and is scheduled to be completed in April 2021.

Additionally, several Metropolitan member agencies made modifications within their own local systems to maximize the use of more readily available Colorado River water and DVL supplies and to further reduce the use of scarce SWP supplies.

In the face of another five percent SWP Table A allocation in 2021, Metropolitan is applying the lessons learned in 2014 and able to reap the benefits of the distribution system modifications that help minimize the use of limited SWP supplies

Implementing the Shortage Response Actions, when needed

Recent legislative changes to the California Water Code (CWC) introduced a new Section 10632, which requires that every urban water supplier prepare and adopt a Water Shortage Continency Plan (WSCP). The WSCP is a guide for a supplier's intended actions during water shortage conditions. It is meant to improve preparedness for droughts and other impacts on water supplies by describing the process used to address varying degrees of water shortages. While intended to be a stand-alone plan that may be revised outside of the UWMP process, the CWC requires suppliers to initially include the WSCP as part of their 2020 UWMP.

Metropolitan developed a WSCP to be consistent with its existing Water Surplus and Drought Management (WSDM) Plan and Water Supply Allocation Plan (WSAP). Metropolitan's WSDM Plan, approved in 1999, provides policy guidance for managing regional water supplies during surplus and shortage conditions. It provides an overall vision for operational supply management and characterizes a flexible sequence of actions to minimize the probability of severe shortages and reduce the likelihood of extreme shortages. Thus, the WSDM Plan principles guide the specific actions to be taken under WSCP shortage stages. Metropolitan's WSAP, developed in 2008, is integral to the WSCP's shortage response strategy. In the event that Metropolitan determines that shortage response actions through supply augmentation and demand reduction measures are insufficient to meet a projected shortage, the WSAP may be implemented to fairly distribute a limited amount of water supply using a detailed methodology that reflects the range of local conditions and needs of the region's retail water consumers.

Metropolitan's Board authorized the implementation of the WSAP for the period of July 2009 through April 2011 in response to the drought and low storage reserves. During the dry period of 2012 through 2016, Metropolitan managed its operations through significant use of regional storage reserves. It was anticipated that at end of year 2014, total dry year storage reserves would approach levels similar to those when the WSAP was first implemented in 2009. On December 9, 2014, Metropolitan's Board approved adjustments to the formula for calculating member agency supply allocations for future implementation of the WSAP. On April 14, 2015, Metropolitan's Board approved implementation of the WSAP at a Level 3 Regional Shortage Level, effective July 1, 2015 through June 30, 2016. The WSAP allows member agencies the flexibility to choose among various local supply and conservation strategies to help ensure that demands on Metropolitan stay in balance with limited supplies.

Over the last three years, favorable supply conditions notably in 2017 and 2019, allowed Metropolitan to rebuild its storage reserves. Metropolitan's regional dry year storage is estimated to be at approximately 3.2 MAF by the end of 2020. In addition, Metropolitan also has 750 TAF of stored supplies reserved to meet service area demands during emergency conditions. Metropolitan's comprehensive shortage response planning, combined with improved storage reserves, puts the region in a better position to withstand future dry conditions. Metropolitan's WSCP, WSDM Plan, and WSAP are described in detail in Section 2 and Appendix 4.

Planning for the Future 2

The purpose of this section is to show the approach and extent to which Metropolitan plans to meet Southern California's water supply needs in the future. In its role as supplemental supplier to its 26 member agencies in the Southern California water community, Metropolitan faces ongoing challenges in meeting its member agencies' needs for water supply reliability and quality in the region. Increased environmental regulations and competition for water from outside the region have resulted in changes in delivery patterns and timing of imported water supply availability. At the same time, the Colorado River has experienced a drying trend over the past 21 years, resulting in reservoir levels that are reduced from historical levels.

As described in the previous chapter, the water used in Southern California comes from a number of sources. From 2010 through 2019, Metropolitan has provided 40 percent to 50 percent of the water needs in its service area from the Colorado River via the CRA, and from the Sacramento-San Joaquin River Watershed via the SWP. As Metropolitan continues to face various water supply challenges, development of adaptable resource management strategies to meet a range of possible future demands is ongoing.

Metropolitan's continued progress in developing a diverse resource mix enables the region to meet its water supply needs. The investments that Metropolitan has made and its ongoing efforts in many different areas coalesce toward its goal of long-term regional water supply reliability. Metropolitan's actions have been focused on the following:

- Continuing water conservation
- Developing water supply management programs outside of the region
- Developing storage programs related to the SWP and the Colorado River
- Developing storage and groundwater management programs within the Southern California region
- Increasing water recycling, groundwater recovery, stormwater, and seawater desalination
- Pursuing long-term solutions for the ecosystem, regulatory and water supply issues in the California Bay-Delta

Metropolitan has undertaken a number of planning initiatives over the years. This section summarizes past and current efforts, which include the 1996 Integrated Water Resources Plan (IRP) and its three updates in 2004, 2010, and 2015; the 2020 IRP; the Water Shortage Contingency Plan; the Water Surplus and Drought Management Plan; the Water Supply Allocation Plan; Metropolitan's Emergency Storage Objective; and Seismic Resiliency Studies. Collectively, they provide policy framework guidelines and resource targets for Metropolitan to achieve its goals towards regional water supply reliability.

While Metropolitan coordinates regional supply planning through its inclusive IRP process, Metropolitan's member agencies also conduct their own planning analyses – including their own urban water management plans – and may develop projects independently of Metropolitan.

Appendix 5 shows a list of potential local projects provided to Metropolitan by its member agencies.

2.1 Integrated Water Resource Planning

In 1993, Metropolitan commenced an Integrated Water Resources Planning process as the beginning of a new era of regional reliability planning for its Southern California service area. As this planning process began, Metropolitan held a series of three regional assemblies from 1993 through 1995 addressing strategic planning issues. Attendance at these regional assemblies included Metropolitan's Board, Metropolitan's senior management, member agency managers, local retail water providers, groundwater basin managers, and invited public representatives. The purpose of these regional assemblies was to gain consensus on resource policy issues, provide direction for future work, and to endorse regional objectives, principles, and strategies.

A key outcome of the regional assemblies was the establishment and adoption of water supply principles which provided critical policy guidance for the development and adoption of future Metropolitan IRPs. In summary, these principles state:

- No water supplier in Southern California is an isolated, independent entity unto itself, and all, to varying degrees, are dependent upon a regional system of water importation, storage, and distribution.
- Metropolitan plays a leading role in Southern California's regional water management, having the responsibility for importing water from outside the region and convening dialogues on regional water issues, encouraging local water development and conservation, advocating the region's interests to the state and federal governments, and leading the region's water community.
- Water suppliers at all levels have a responsibility to promote a strong water ethic both within the water community and among the public, developing plans through open processes, committing to achieving adopted regional goals and strategies, and committing to a policy of equity and fairness in development and implementation of water management programs.

These regional assemblies laid the foundation for Metropolitan's integrated regional planning path from 1996 to the present. This path has guided Metropolitan's water resources strategy from the initial adoption of the Metropolitan's IRP in 1996 to successive IRP updates in 2004, 2010, and 2015.

The 1996 IRP

Metropolitan's inaugural IRP established a long-term, comprehensive water resources strategy to provide the region with a reliable and affordable water supply. One of the fundamental outcomes of the 1996 IRP was the identification and subsequent implementation of a diverse portfolio of resource investments in both imported and in--region supplies, and in water conservation measures. The 1996 IRP further emphasized the construction and creation of a network of water storage facilities, both below and above ground. It also set a regional water supply reliability goal of providing full capability to meet all retail-level water demands under all foreseeable hydrologic events.

The 1996 IRP process identified cost-effective solutions that offered long-term reliability to the region. Having identified the need for a portfolio of diversified supplies to meet its demands, the 1996 IRP analyzed numerous resource portfolios seeking to find a "Preferred Resource Mix" that would provide the region with reliable and affordable water supplies through 2020. The analysis determined the preferred mix of resources based on cost-effectiveness, diversification, and reliability. Establishing the "Preferred Resource Mix" was an integral part of the 1996 IRP, and subsequent updates have continued to focus on how best to diversify Metropolitan's water portfolio and establish the broad resource targets for the region that helped to meet IRP objectives.

The 2004 IRP Update

The 2004 IRP Update was the first major review and update in the IRP process. The 2004 IRP Update reviewed the goals and achievements of the 1996 IRP, identified the changed conditions for water resource development, and updated resource development targets through 2025. These targets included increased conservation savings and planned increases in local supplies. The 2004 IRP Update also explicitly recognized the need to handle uncertainties inherent in any planning process. Some of these uncertainties include:

- Fluctuations in population and economic growth
- Changes in water quality regulations
- Discovery of new chemical contaminants
- Regulation of endangered species affecting sources of supplies
- Changes in climate and hydrology

As a result, a key component of the 2004 IRP Update was the addition of a 10 percent "planning buffer." The planning buffer identified additional supplies, both imported and locally developed, that could be implemented to address uncertainty in future supplies and demands.

The 2010 IRP Update

In keeping with the reliability goal established under the original 1996 IRP of meeting full-service demands at the retail level under all foreseeable hydrologic conditions, the 2010 IRP Update sought to stabilize Metropolitan's traditional imported water supplies and establish additional water resources to withstand California's inevitable dry cycles and growth in water demand. The 2010 IRP Update marked the first time that Metropolitan and its member agencies explicitly acknowledged the increasing impact that emerging challenges and uncertainties such as environmental regulations, threats to water quality, climate change, and economic unknowns would have on planning for a reliable, high quality, and affordable water supply. By 2010, the Colorado River had experienced below-average precipitation conditions for most of the previous decade, and the SWP was facing historic regulatory cutbacks that significantly reduced its supplies that pass through the Sacramento-San Joaquin Delta in Northern California. Recognizing that the conditions for developing and maintaining water supply reliability had changed, Metropolitan set out not only to update the IRP, but also to examine how best to adapt to the new water supply paradigm.

Adaptive Management Strategy

The 2010 IRP Update specifically planned for uncertainty with a range of adaptive management strategies that both meets demands under observed hydrologic conditions and responds to future uncertainty. The plan provided solutions by developing diverse and flexible resources that perform adequately under a wide range of future conditions. Specifically, the adaptive management strategy was a three-component plan that included the following:

- Core Resources Strategy – Designed to maintain reliable water supplies under known conditions. The Core Resources Strategy represented baseline efforts to manage water supply and demand conditions. This strategy was based on "what we know today," including detailed planning assumptions about future demographic scenarios, water supply yields, and a range of observed historical weather patterns. Under this strategy, Metropolitan and its member agencies would advance water use efficiency through conservation and recycled water, along with further local supply development such as groundwater recovery and seawater desalination. Metropolitan would also stabilize traditional imported supplies from the Colorado River and Northern California.

- Uncertainty Buffer – A suite of actions which help to mitigate short-term changes. The 2010 IRP Update set goals for a range of potential buffer supplies to protect the region from possible shortages in a cost-effective manner, starting with a further expansion of water use efficiency on a region-wide basis. The buffer would enable the region to adapt to future circumstances and foreseeable challenges that were not assumed under the Core Resources Strategy, such as short-term loss of local supplies or regulatory restrictions.
- Foundational Actions – Strategies for additional water resources to augment the core or buffer supplies. Foundational Actions were designed to prepare the region by determining viable alternative supply options for long-range planning. These preparatory actions, including feasibility studies, technological research and regulatory review, were designed to lay the foundation for potential alternative resource development.

The 2015 IRP Update

Following the 2010 IRP, drought in California and across the southwestern United States has put the IRP adaptive management strategy to the ultimate stress test. Dry conditions in California persisted into 2015, resulting in a fourth consecutive year of drought. The year 2015 began with the driest January on record, resulting in the earliest and lowest snowpack peak in recorded history at only 17 percent of the traditional snowpack peak on April 1st. In the ten years since 2006, there were only two wet years, with the other eight years having been below normal, dry, or critically dry. Within Southern California, continuing dry conditions impacted the region's local supplies, including its groundwater basins.

Throughout 2015, Metropolitan engaged in a comprehensive process with its Board of Directors and member agencies to review how conditions had changed since the 2010 IRP Update and to establish targets for achieving regional reliability, taking into account known opportunities and risks. Areas reviewed in the 2015 IRP Update include demographics, hydrologic scenarios, water supplies from existing and new projects, water supply reliability analyses, and potential resource and conservation targets. Metropolitan's Board of Directors adopted the 2015 IRP Update on January 12, 2016.[1]

The 2015 IRP Update approach explicitly recognizes that there are remaining policy discussions that will be essential to guiding the development and maintenance of local supplies and conservation. Since the adoption of the 2015 IRP Update and its targets for water supply reliability, Metropolitan has begun a process to address questions such as how to meet the targets for regional reliability, what are local and what are regional responsibilities, how to finance regional projects, etc. This discussion will involve extensive interaction with Metropolitan's Board of Directors and member agencies, with input from the public.

[1] http://www.mwdh2o.com/PDF_About_Your_Water/2015_IRP_Update_Report.pdf

Findings and Conclusions

The findings and conclusions of the 2015 IRP Update are:

- Action is needed – Without the investments in conservation, local supplies, and the California WaterFix targeted in the 2015 IRP Update, Metropolitan's service area would experience unacceptable level of shortage allocation frequency in the future.
- Maintain Colorado River supplies – The plan to stabilize deliveries at 900,000 AF in a typical year will require more than 900,000 AF of planned actions.
- Stabilize SWP supplies – A collaborative approach with state and federal agencies to pursue better science for resolving questions about SWP operations and advancing coequal goals of Delta restoration and statewide water supply reliability in the near term. Also work collaboratively with state and federal agencies in the California WaterFix and EcoRestore efforts.
- Develop and protect local supplies and water conservation – The 2015 IRP Update embraces and advances the regional self-sufficiency ethics by increasing the targets for additional local supplies and conservation. These targets are discussed in detail in Section 3 of this UWMP.
- Maximize the effectiveness of storage and transfers – Rebuilding Metropolitan's supply of water reserves is imperative when the drought is over. A comprehensive water transfer approach that takes advantage of water when it is available will help to stabilize and build storage reserves, increasing Metropolitan's ability to meet water demands in dry years.
- Continue with the adaptive management approach – The IRP is updated periodically to incorporate changed conditions, and an implementation report is prepared annually to monitor the progress in resources development. The 2015 IRP Update also includes Future Supply Actions (renaming the Foundational Actions component of the 2010 IRP Update to better reflect the attention on developing future supplies) that would advance a new generation of local supplies through public outreach; development of legislation and regulation; technical studies and support; and land and resource acquisitions.

The 2020 IRP

The 2020 IRP provides a broader look and concept than the previous IRP updates. The 2020 IRP strengthens the adaptive management approaches employed in prior updates through the incorporation of an explicit scenario planning step. Coming on the completion of a full "planning cycle" with reaching the end of the planning horizon of the 1996 IRP, the 2020 IRP has the benefit of a fuller understanding of the lessons learned from the previous 25 years. The key lesson is that the future is not predictable and is a function of many diverse drivers that are out of the control of the water community. The purpose of scenario planning is to broaden the understanding of plausible, but uncertain, future conditions affecting both supplies and demands. On the demand side, uncertainties surrounding future economic conditions, the extent to which local supplies are developed, and water use behavior will guide member agency dependence on Metropolitan in meeting their retail demands. On the supply side, factors like climate change impacts and regulatory uncertainty are expected to affect future supply availability in unpredictable ways.

With these uncertainties in mind, scenario planning will allow for the evaluation of investments and actions needed to achieve desired reliability under a diverse range of future conditions. It will also reinforce the adaptive capabilities of the IRP by identifying and enabling the development of future "sign-posts" indicating emerging conditions that may require the redirection of future investments and actions.

While prior IRP updates have addressed uncertainty, adaptation, and preparedness, the addition of a scenario planning element to the process further explores the plausible futures that Metropolitan may confront. Since retaining the ability to adapt through investments in preparedness can be expensive, the scenario planning element should support informed decisions regarding affordable levels of preparedness, as well as identify unacceptable consequences of inaction.

The process of developing scenarios is built on a comprehensive identification of those drivers of change that affect supply stability and demands on Metropolitan. Building on input received from the Board, member agencies, and the public, four scenarios were developed within a framework that examined the drivers of change over a range of future demands on Metropolitan and imported supply stability. This exercise provides four sets of logical, quantified assumptions resulting in unique supply demands gaps against which various investment options can be tested.

The UWMP, along with the original IRP and its subsequent updates, used a single set of assumptions for the uncertainties that drive supply and demands. In the 2020 IRP, Metropolitan explicitly acknowledges that the future is unpredictable and that a scenario planning approach can expand our thinking by examining multiple plausible futures. This approach will better prepare Metropolitan's service area for the uncertainties that lie ahead. Metropolitan believes this is an improvement over the single outcome approach taken in past IRPs and the UWMP requirements. It is important to emphasize that the scenario planning element of the 2020 IRP complements the IRP planning approach that has evolved since 1996. It is also important to note that the UWMP assumptions fall within the plausible futures contemplated in the IRP. This means that, while the reliability assessments in the UWMP comply with the Act, Metropolitan and its member agencies are contemplating and comparing future conditions that are beyond the requirements of the Act and thus will be prepared for a wider range of conditions than shown in the UWMP assessments. The following sections describe the methodology and IRP assumptions being applied for the purposes of the UWMP.

2.2 Estimating Demands on Metropolitan

The Urban Water Management Planning Act requires suppliers to conduct three key basic planning analyses to evaluate supply reliability. The first is a water service reliability assessment that compares the total water supply sources available to the water supplier with the long-term projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and a drought lasting five consecutive water years. The second is a drought risk assessment (DRA) that evaluates a drought period that lasts five consecutive water years starting from the year following when the assessment is conducted. And third, a Water Shortage Contingency Plan (WSCP) that includes a detailed proposal for how the supplier intends to act during actual water shortage conditions. As one of the recent additions to the Act's requirements, suppliers need to present the WSCP as part of their UWMP. However, the WSCP is its own independent plan that shall be adopted and provided to customers, cities, and counties within the supplier's service area, and may be amended independent of a supplier's UWMP. These required assessments and planning are included in Sections 2.3, 2.4, and 2.5.

The 2020 UWMP presents Metropolitan's water reliability assessments from 2025 through 2045. As specified in the Act, there are three year types that must be included in the water service reliability assessment for the UWMP. To simulate hydrologic conditions for the required reliability assessments, Metropolitan assumed the following:

- <u>Normal Year</u>. The average of historic years 1922 to 2017 most closely represents the water supply conditions that Metropolitan considers available during normal water year.
- <u>Single Dry Year</u>. The conditions for the year 1977 represent the lowest water supply available to Metropolitan.
- <u>Five-Consecutive-Year Drought</u>. The five consecutive years of 1988 to 1992 represent the driest five-consecutive year historical sequence for Metropolitan's water supply. This five-year sequence is used to complete both Metropolitan's water service reliability and drought risk assessments.

Metropolitan developed estimates of future demands and supplies from local sources and from Metropolitan sources based on 96 years (1922-2017) of historic hydrologic conditions. The 96-year period starting in 1922 was chosen because the CalSim 2 model used in the 2019 SWP Delivery Capability Report began in 1922. Supply and demand analyses for the single-dry year and 5-year drought cases were based on conditions affecting the SWP as this supply availability fluctuates the most among Metropolitan's sources of supply. Using the same 96-year period of the SWP supply availability, 1977 is the single driest year, and 1988 through 1992 are the 5 consecutive driest years for SWP supplies to Metropolitan. In addition, staff analysis of the 8-river index indicated that 1977 is the single driest year and 1988 through 1992 are the lowest 5 consecutive dry years from 1922 through 2017. The 8-river index is used widely by DWR and other water agencies as an estimate of the unimpaired runoff (or natural water production) of the Sacramento and San Joaquin River basins, which are sources of water for the SWP.

Demand Projection for the UWMP

Metropolitan developed its demand projections for the UWMP by first estimating total retail demands for its service area and then factoring out water savings attributed to conservation.[2] Projections of local supplies were then derived using data from current and expected local supply programs. The resulting difference between total demands net of savings from conservation and local supplies is the expected regional demands on Metropolitan supplies.

[2] Information generated as part of this analysis is contained in Appendix 1.

These various estimates are shown in Tables 2-1 through 2-3. Major categories used in these tables are defined below.

Total Demands

Total demands are the sum of retail demand for M&I and agricultural, seawater barrier demand, and replenishment demand. Total demands represent the total amount of water needed by the member agencies. Total demands include:

- Retail Municipal and Industrial (M&I) Demand – Retail M&I demands represent the full spectrum of urban water use within the region. These include residential, commercial, industrial, institutional, and un-metered water uses. Demographic and economic factors are the major drivers behind M&I water demands. The demographic and economic data used in developing these projections for the UWMP were taken from the Southern California Association of Governments' (SCAG) 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy from the Connect SoCal Complete Report (as adopted on May 7, 2020) and from the San Diego County Association of Governments' (SANDAG) San Diego Forward: The 2019 Federal Regional Transportation Plan (October 2019, Version 17). The SCAG and SANDAG regional growth forecasts are the core assumptions that drive the estimating equations in Metropolitan's Econometric Demand Model (MWD-EDM)**.**

  SCAG's and SANDAG's projections undergo extensive local review, incorporate zoning information from city and county general plans, and are backed by Environmental Impact Reports. Both SCAG and SANDAG prepare demographic forecasts based on land use data for their respective regions through extensive processes that emphasize input from local planners and are done in coordination with local or regional land use authorities, incorporating essential information to reflect anticipated future populations and land uses. These growth forecasts are used to guide development of regional plans and strategies mandated by federal and state governments. Metropolitan's use of SCAG and SANDAG projections is consistent with CWC Section 10631's requirement for suppliers to include current and projected land uses within the existing or anticipated service area affecting the supplier's water management planning.

  Impacts of potential annexation are not included in the demand projections for the 2020 UWMP. However, Metropolitan's Review of Annexation Procedures concluded that the impacts of annexation within the service area beyond 2020 would not exceed two percent of overall demands.

- Retail Agricultural Demand – Retail agricultural demands consist of water use for irrigating crops. Member agencies estimate agricultural water use based on many factors, including farm acreage, crop types, historical water use, and land use conversion. Each member agency estimates its agricultural demand differently, depending on the availability of information. Metropolitan relies on member agencies' estimates of agricultural demands for the 2020 UWMP.

- Seawater Barrier Demand – Seawater barrier demands represent the amount of water needed to hold back seawater intrusion into the coastal groundwater basins. Groundwater management agencies determine the barrier requirements based on groundwater levels, injection wells, and regulatory permits.

- Storage Replenishment Demand – Storage replenishment demands represent the amount of water member agencies plan to use to replenish their groundwater basins or surface reservoirs in order to maintain sustainable basin/reservoir heath and production. For the 2020 UWMP, replenishment deliveries are not included as part of consumptive demands**.**

Climate impacts to M&I and Agricultural demands are captured using climate adjustment factors. These factors were estimated using observed range of weather variables, precipitation and temperature, on historical consumptive demands. Metropolitan updated these factors to include the most recent weather and climate outcomes and recent changes in water use and irrigation demands. By incorporating these factors, Metropolitan's demand projections are calibrated to the more recent water use behaviors and better reflect current climate change impacts.

Conservation Adjustment

Water savings from conservation reduces total retail demand. Conservation savings consists of the following:

- Code-Based Conservation – Water savings resulting from plumbing codes and other institutionalized water efficiency measures. Sometimes referred to as "passive conservation," this form of conservation would occur as a matter of course without any additional financial incentives from water agencies. In addition, water savings from Model Water Efficiency Ordinance (MWELO) is assumed for 50 percent of new home construction since the ordinance does not have a uniform effective enforcement mechanism for compliance. MWELO is also assumed not to affect water use projections for existing homes and businesses. Water savings from codes, standards, and ordinances are discussed in Appendix 6.
- Active Conservation – Water saved as a direct result of programs and practices directly funded by a water utility. Active conservation is unlikely to occur without agency action.
- Price Effect Conservation – Reductions in customer use attributable to changes in the real (inflation adjusted) cost of water. Because water has a positive price elasticity of demand, increases in water price will decrease the quantity of water demanded by the end use consumer.
- Pre-1990 Savings – Conservation savings are commonly estimated from a base-year water-use profile. Beginning with the 1996 IRP, Metropolitan identified 1980 as the base year for estimating conservation because it marked the effective date of a new plumbing code in California requiring toilets in new construction to be rated at 3.5 gallons per flush or less. Between 1980 and 1990, Metropolitan's service area saved an estimated 250 TAF per year as the result of this 1980 plumbing code and unrelated water rate increases. Within Metropolitan's planning framework, these savings are referred to as "pre-1990 savings."

Metropolitan's conservation savings projection includes savings from Metropolitan's Conservation Credits Program, code-based conservation, price effect conservation, and pre-1990 device retrofits. The projection does not include savings from the implementation of future active conservation programs.

Local Supplies

Local supplies represent water produced or imported independently by the member agencies and other local water agencies within Metropolitan's service area. Local supplies are a key component in determining how much Metropolitan supply is needed. Projections of local supplies relied on information gathered from several sources including past urban water management plans, Metropolitan's annual local supply survey, and communications between Metropolitan and member agency staff. Local supplies include:

- Groundwater and Surface Water – Groundwater production consists of extractions from local groundwater basins. Groundwater production is supported by the active recharge of stormwater, recycled water, and imported water. Passive recharge (or native yield) also supports groundwater production. Surface water comes from stream diversions and rainwater captured in reservoirs.

- The Los Angeles Aqueduct – A major source of imported water is conveyed from the Owens Valley via the Los Angeles Aqueduct (LAA) by the Los Angeles Department of Water and Power (LADWP). Although LADWP imports water from outside of Metropolitan's service area, Metropolitan classifies water provided by the LAA as a local resource because it is developed and controlled independently by a local agency.
- Seawater Desalination – Highly treated seawater suitable for municipal and industrial potable use.
- Groundwater Recovery and Recycled Water – Developed and operated by local water agencies, groundwater recovery projects treat degraded groundwater to meet potable use standards. Recycled water projects recycle wastewater for municipal, industrial, and agricultural consumptive uses as well as for groundwater replenishment and local seawater intrusion barriers.

The local supply projections presented in the demand tables are consistent with the local supply projections that the Metropolitan member agencies are including in their respective UWMPs.[3][4] Information regarding the member agencies' local supply projections was compiled through the extensive coordination process between Metropolitan and its member agencies. Additionally, Metropolitan maintains an inventory of member agency local supply projects that have been identified within Metropolitan's service area. Appendix 5 contains the inventory of local supply projects by type of supply and includes a classification that shows the current stage of development for each supply in the inventory. The stages of development included in Appendix 5 are: Existing, Under Construction, CEQA, and Conceptual projects. The project inventory in Appendix 5 was updated and completed as part of the 2020 IRP Update survey completed by Metropolitan's member agencies in June 2019 and October 2020.

Determining Demands on Metropolitan

Metropolitan serves imported water to its 26 member agencies. For most member agencies, they have other sources of water produced locally from groundwater basins, surface reservoirs, the LAA, recycled water projects, groundwater recovery projects, and seawater desalination projects. When local supplies are not enough to meet retail demands, member agencies purchase supplemental water from Metropolitan.

In determining demands for imported water, Metropolitan developed its Sales Model to calculate the difference between total forecasted retail demands and local supply projections

[3] One variation from the member agency local supply reporting is the Colorado River water SDCWA secured from Coachella Canal Lining Project and All-American Canal Lining Project that it exchanges with Metropolitan pursuant to the parties' Exchange Agreement, since that water is provided to Metropolitan at Lake Havasu where Metropolitan receives other Colorado River water, used by Metropolitan like other Colorado River supplies, and Metropolitan delivers a like-amount of Metropolitan blended water to SDCWA in exchange. (See Section 1 at p. 22.)

[4] Another variation from the member agency local supply reporting is the hydrology used for projecting future Los Angeles Aqueduct supply. LADWP in its UWMP uses a 30-year median hydrology from FY 1985/86 to 2014/15 while Metropolitan uses the 1922 to 2017 hydrology provided by LADWP, consistent with Metropolitan's modeling framework. The discrepancies between LADWP's 30-year median hydrology and Metropolitan's 96 hydrology resulted in Metropolitan's projection being approximately 70,000 acre-feet higher in average conditions. In a single dry-year, LADWP uses the FY 1989/1990 hydrology while Metropolitan uses 1977 hydrology, resulting in Metropolitan's projection being approximately 50,000 acre-feet higher. Both Metropolitan and LADWP use the 1988-1992 hydrology for five consecutive dry-year conditions.

on a per member agency basis. The balance is the demand on Metropolitan's imported water supply. The Sales Model calculates the difference between forecasted demands and projected local supplies after factoring in climate impacts to both demand and local supply. The Sales Model employs a modeling method using historical hydrologic conditions from 1922 to 2017 to simulate the expected demands on Metropolitan supplies based on hydrologic conditions. Each hydrologic condition results in one possible outcome for the forecast year in the planning horizon. For example, each forecast year, such as 2025, has 96 possible outcomes, one for each historical hydrology year during the period 1922 to 2017. This method of modeling produces a distribution of outcomes ranging from the driest to the wettest years within this historical period.

The Sales Model forecasts three types of demands on Metropolitan:

1. Consumptive Use – Metropolitan's supplies that are used to meet retail M&I demand.
2. Seawater Barrier – Imported water needed to hold back seawater intrusion into the coastal groundwater basins.
3. Replenishment – Water for groundwater or reservoir replenishment, when available, to meet replenishment demands.

Due to differences in data and modeling methodology, the results of Metropolitan's forecast are not directly comparable to member agencies' forecasts. Differences from the member agencies forecasts are not cumulative and can offset each other on the regional level. The overall impact is within the range of Metropolitan's supply capability under all year types.

For additional information on Metropolitan's demand forecast, see Appendix 1.

Table 2-1
Metropolitan Regional Water Demands
Single Dry-Year
(Acre-Feet)

		2025	2030	2035	2040	2045
A.	**Total Demands[1]**	**4,929,000**	**5,037,000**	**5,160,000**	**5,265,000**	**5,378,000**
	Retail Municipal and Industrial	4,397,000	4,507,000	4,626,000	4,737,000	4,848,000
	Retail Agricultural	144,000	134,000	130,000	122,000	123,000

2.3 Water Reliability Assessment

After estimating demands for normal water year, single dry year, and droughts lasting at least five years, the water reliability assessment for the UWMP requires urban water suppliers to identify projected supplies to meet these demands. Table 2-4 summarizes the sources of supply for the single dry year (1977 hydrology), while Table 2-5 shows the region's ability to respond in future years under a repeat of the 1988-92 drought period lasting five consecutive water years. Table 2-5 provides results for the average of the five consecutive dry-year period rather than a year-by-year detail. Over the years, Metropolitan has developed numerous programs to increase its water supply capabilities, dry year supplies, and regional storage. These programs may be exercised in conjunction with effective demand management measures during drought years. Under this reliability planning, if a five consecutive year drought sequence was to repeat, Metropolitan could exercise similar supply augmentation and demand management options for each of the five drought years at the appropriate level to meet demands. This methodology best captures Metropolitan's complex demand and supply planning with appropriate flexibility. Table 2-6 reports assessment under a normal water year represented by the average of the 96 historic hydrologies from 1922 to 2017. Appendix 2 provides a detailed description of the existing regional water supplies and Appendix 3 contains detailed justifications for the sources of supply used for this analysis.

Metropolitan's supply capabilities are evaluated using the following assumptions:

Colorado River Supplies

Colorado River supplies include Metropolitan's basic Colorado River apportionment, as well as supplies that result from existing and committed programs, including those from the IID-MWD Conservation Program, the implementation of the Quantification Settlement Agreement (QSA), related agreements, and the exchange agreement with SDCWA. The QSA established the baseline water use for each of the agreement parties and facilitates the transfer of water from agricultural agencies to urban uses. Since the QSA, additional programs have been implemented to increase Metropolitan's supplies. These include the PVID Land Management, Crop Rotation, and Water Supply Program, as well as the Lower Colorado River Water Supply Project. The 2007 Interim Guidelines provided for the coordinated operation of Lake Powell and Lake Mead, as well as the Intentionally Created Surplus (ICS) program that allows Metropolitan to store water in Lake Mead. These stored supplies can be used to supply additional water to ensure that, when needed, Metropolitan can deliver up to the CRA capacity of 1.25 MAF. A detailed discussion of the QSA is included in Section 3.1 and Appendix 3.1.

In light of declining reservoir levels, the Lower Basin Drought Contingency Plan (DCP) was signed in 2019. This agreement incentivizes storage in Lake Mead and requires certain volumes of water be stored in Lake Mead under certain Lake Mead elevation levels through 2026. Metropolitan is to store certain volumes of water in Lake Mead as DCP ICS once Lake Mead is below elevation 1,045 feet. This agreement also increases Metropolitan's flexibility to take delivery of water stored as ICS at Lake Mead elevations below 1,075 feet. The goal of this agreement is to keep Lake Mead above critical elevations, and overall, it increases Metropolitan's flexibility to store water in Lake Mead in greater volumes and to take delivery of stored water to fill the CRA as needed.

Projections for the Colorado River supplies for the 2020 UWMP are based on the United States Bureau of Reclamation's (USBR) Colorado River Simulation System (CRSS) modeling developed in January 2021, which is the latest available at the time of production of this plan. USBR modeling is used to estimate Metropolitan's basic apportionment and the availability of QSA and other related programs. While the official January 2021 CRSS run uses a full historical hydrology set, USBR also examines a stress test hydrology set as a proxy to show climate change impacts. The stress test hydrology includes the latest 30 years which has lower inflows as compared to the full hydrology. The reliability assessments are inclusive of the sequence of hydrology found within the stress test hydrology set and is by proxy an estimate of lower inflows resulting from climate change. USBR is currently developing a climate change hydrology set that utilizes a suite of global climate models but it was unavailable at this time. For this reliability assessment, Metropolitan used the current methodologies USBR employs in its official CRSS run.

State Water Project Supplies

SWP supplies are estimated using the 2019 SWP Delivery Capability Report distributed by DWR in August 2020 and the Early Long-Term (ELT) Alternative described in the 2015 SWP Delivery Capability Report. The 2019 SWP Delivery Capability Report presents current DWR estimates of the amount of water deliveries for current (2020) conditions and conditions 20 years in the future, assuming currently existing SWP facilities. Since this UWMP uses DWR's 2019 SWP Delivery Capability Report to estimate future SWP supplies, any changes in supply reliability that would result from new facilities proposed under the Delta Conveyance Project and Sites Reservoir are not included in the following tables. These estimates incorporate restrictions on SWP and Central Valley Project (CVP) operations in accordance with water quality objectives established by the State Water Resources Control Board, the biological opinions of the U.S. Fish and Wildlife Service and National Marine Fisheries Service issued on October 21, 2019, and the Incidental Take Permit issued by the California Department of Fish and Wildlife on March 31, 2020. In addition, these estimates incorporate amendments to the Coordinated Operations Agreement between the Central Valley Project and the State Water Project made in 2018. Under the 2019 SWP Delivery Capability Report - existing condition scenario, the delivery estimates for the SWP for 2020 conditions as a percentage of Table A amounts are 58 percent, equivalent to 1,109 TAF for Metropolitan, under a single dry-year (1977) condition and 7 percent, equivalent to 134 TAF for Metropolitan, under a long-term average condition. Detailed description of SWP supply programs are included in Section 3.2 and Appendix 3.2. To include consideration of climate change impacts, the ELT alternative as described in the 2015 Delivery Capability Report was also utilized in the analysis. DWR included climate change impacts to deliveries at a 2025 emission level and 15 cm of sea level rise in this alternative. DWR also considers the current impacts to State Water Project deliveries from existing subsidence in the Delivery Capability Report. In the 2019 Delivery Capability Report, they found that subsidence has reduced the flow capacity in the aqueduct at locations in San Luis and San Joaquin Field Divisions but has not yet resulted in a reduction in deliveries. DWR may address any potential future impacts of subsidence based on the efficacy of Sustainable Groundwater Management Act and Groundwater Management Plans in future analyses.

In dry, below-normal conditions, Metropolitan has increased the supplies received from the California Aqueduct by developing flexible Central Valley/SWP storage and transfer programs. Over the years, under the pumping restrictions of the SWP, Metropolitan has collaborated with the other contractors to develop numerous voluntary Central Valley/SWP storage and transfer programs. The goal of these storage/transfer programs is to develop additional dry-year supplies that can be conveyed through the California Aqueduct during dry hydrologic conditions and regulatory restrictions. Descriptions of these storage and transfer programs are included in Section 3.3 and Appendix 3.2.

Storage

A key component of Metropolitan's water supply capability is the amount of water in Metropolitan's storage facilities. Over the past two decades, Metropolitan has developed a large regional storage portfolio that includes both dry-year and emergency storage capacity. Storage is a key component of water management. Storage enables the capture of surplus amounts of water in normal and wet climate and hydrologic conditions when it is plentiful for supply and environmental uses. Stored water can then be used in dry years and in conditions where augmented water supplies are needed to meet demands. Metropolitan's resource analysis model considers all the capacities and constraints of its storage facilities and programs and simulates the fill and withdrawal of these facilities through the 96 hydrologic conditions from 1922 to 2017. In-region storage and supply programs are discussed in detail in Section 3.6 and Appendix 3.3.

Interpreting Metropolitan's Reliability Assessment and Supply Capabilities in the UWMP

Metropolitan's long-term water service reliability assessment performed for the UWMP shows that, under required and stated assumptions and the conditions required by the Act, there would be supply and storage capabilities, and projected surplus supplies, sufficient to meet projected demands from 2025 through 2045. This assessment applies under a normal water year, a single dry year, and five consecutive drought year conditions as specified by the Act. However, this assessment should be considered as addressing the specific conditions and assumptions stated in the UWMP and is not inclusive of a fuller range of assumptions and conditions that are considered in the 2020 IRP, which is Metropolitan's primary long-term water supply reliability planning process. To address the uncertainties and planning parameters in the IRP, additional supply and demand management measures may be identified and developed and implemented that are outside of the needs and capabilities indicated by the UWMP reliability assessments. A write up on the impact of alternative forecasts and projections of local supplies on Demand on Metropolitan is included in the 2020 Reference Materials page posted on Metropolitan's website (www.mwdh2o.com). This write up provides supplemental information on alternative forecasts and projections for estimating local supply development and production in the service area that may be appropriate for different planning applications and its impact on estimates of Demand on Metropolitan.

[1] Represents Supply Capability for resource programs under listed year type.
[2] California Aqueduct includes Central Valley transfers and storage program supplies conveyed by the aqueduct.
[3] Colorado River Aqueduct includes programs and Exchange with SDCWA conveyed by the aqueduct.
[4] Maximum CRA deliveries limited to 1.25 MAF including Exchange with SDCWA.
[5] Total demands are adjusted to include Exchange with SDCWA.

2.4 Drought Risk Assessment

CWC Section 10635(b) requires every urban water supplier to include, as part of its urban water management plan, a drought risk assessment (DRA) for its water service as part of information considered in developing its demand management measures and water supply projects and programs. The DRA analysis allows suppliers to consider how to manage their water supplies during stressed hydrologic conditions in relation to variations in demand. The DRA helps a supplier to evaluate the functionality of its WSCP shortage response actions and understand the type and degree of response that is appropriate for managing water supplies. This evaluation can help the supplier to identify risks and take proactive steps before the next actual drought lasting at least five consecutive years.

CWC Section 10612 requires the DRA to be based on the driest five-year historic sequence for the agency's water supply. Furthermore, CWC Section 10635 also requires that the analysis consider plausible changes on projected supplies and demands due to climate change, anticipated regulatory changes, and other locally applicable criteria, and that the DRA start from the year following when the assessment is conducted. For the 2020 UWMP, DRA is developed for years 2021 through 2025. Accordingly, the 2020 UWMP Guidebook suggests that the historic five driest consecutive years on record may be considered a starting point in the analysis which is informed by other factors. Suppliers may then use these estimated supply conditions to prepare the DRA analysis, assuming they occur over the next five years.

For Metropolitan, the five-consecutive years of 1988 to 1992 represent the driest five-consecutive year historic sequence for Metropolitan's water supply. Thus, Metropolitan used this five-year historic sequence to complete its DRA. Metropolitan developed estimates of future demands and supplies from local sources and from Metropolitan sources based on 96 years (1922-2017) of historic hydrology. Supply and demand analyses for droughts lasting at least five consecutive water years were based on conditions affecting the SWP, as this supply availability fluctuates the most among Metropolitan's sources of supply. Using the same 96-year period of the SWP supply availability, 1988 to 1992 is the driest 5-year historical sequence that represents the lowest water supply available for SWP supplies to Metropolitan. In addition, staff analysis of the 8-river index indicates that the period 1988 to 1992 represents the lowest five consecutive dry years from 1922 through 2017. The 8-river index is used by DWR and other water agencies as an estimate of the unimpaired runoff (or natural water production) of the Sacramento and San Joaquin River basins, which are sources of water for the SWP.

Water Use Characterization

Metropolitan developed its demand forecast by first estimating total retail demands for its service area and then factoring out water savings attributed to conservation.[5] Projections of local supplies then were derived using data from current and expected local supply programs. The resulting difference between total demands net of savings from conservation and local supplies is the expected regional demands on Metropolitan supplies. As explained in detail in Section 2.2, Metropolitan used its Sales Model to calculate the difference between total forecasted retail demands and local supply projections. The balance is the demand on Metropolitan that will be met by supplies from Colorado River, SWP, and in-region storage.

Based on the 96 years of historic hydrologic condition (1922 to 2017), the five consecutive years of 1988 to 1992 represent the driest five-consecutive year historical sequence for Metropolitan's water supply and the five consecutive driest years for SWP supplies. Thus, Metropolitan used a repeat of the historic condition of 1988 to 1992 to assess the near-term drought risk for years 2021

[5] Information generated as part of this analysis is contained in Appendix 1.

to 2025. Under this assessment, the historic condition for 1988 is used to forecast the water use for the first year 2021, the historic condition for 1989 is used to forecast the water use for the second year 2022, and so on up to year 2025. Metropolitan's projected water use is presented annually for the next five years in Table 2-7, including the year-by-year change in projected use. In addition, estimated actual water use for 2020 and the historic water use for 2016 through 2019 are presented in Table 2-7.

Climate impacts to M&I and Agricultural demands are captured using climate adjustment factors. These factors were estimated using observed range of weather variables, precipitation and temperature, on historical consumptive demands. Metropolitan updated these factors to include the most recent weather and climate outcomes and recent changes in water use and irrigation demands. By incorporating these factors, Metropolitan's demand projections are calibrated to the more recent water use behaviors and better reflect current climate change impacts.

Supply Characterization

Metropolitan's assumptions for its supply capabilities are discussed and presented in 5-year increments under its water reliability assessment in Section 2.3. For Metropolitan's DRA, these supply capabilities are further refined and presented annually for the years 2021 to 2025 by assuming a repeat of historic conditions from 1988 to1992. This historic five-year sequence represents the lowest water supply available for SWP supplies to Metropolitan.

For its DRA, Metropolitan assessed the reliability of each individual water supply source over the five consecutive year drought through a modeling method using the same historical hydrologic conditions from 1922 to 2017. Also, as part of this DRA, the expected quantity of each water supply source for each year of the five-year drought was evaluated and included within the tabulated capability of each supply category. Metropolitan's supply sources under the CR, SWP, and in-region supply categories are individually listed and discussed in detail in Section 3. Future supply capabilities for each of these supply sources are also individually tabulated in Appendix 3, with consideration for plausible changes on projected supplies under climate change conditions, anticipated regulatory changes, and other factors. as explained in Section 2.6.

Metropolitan used DWR's analyses of SWP delivery capability which includes climate change impacts to deliveries at a 2025 emission level and 15 cm of sea level rise. This resulted in adjusted delivery capability. The DWR analyses also incorporates restrictions on SWP and Central Valley Project (CVP) operations in accordance with water quality objectives established by the State Water Resources Control Board, the biological opinions of the U.S. Fish and Wildlife Service and National Marine Fisheries Service issued on October 21, 2019, and the Incidental Take Permit issued by the California Department of Fish and Wildlife on March 31, 2020. In addition, these estimates incorporate amendments to the Coordinated Operations Agreement between the Central Valley Project and the State Water Project made in 2018. In the 2019 Delivery Capability Report, they found that subsidence has reduced the flow capacity in the aqueduct at locations in San Luis and San Joaquin Field Divisions but has not yet resulted in a reduction in deliveries.

For the Colorado River, Metropolitan used the official January 2021 CRSS run which utilized a full hydrology set. USBR also examines a stress test hydrology set as a proxy to show climate change impacts. The stress test hydrology includes the latest 30 years and has lower inflows as compared to the full hydrology. The driest five-year period 1988-1992 falls within this stress test hydrology. USBR acknowledges that climate change impacts are demonstrated in the stress test hydrology. The five-year dry period used by Metropolitan in the DRA is within this stress test hydrology period, incorporating the decreased inflows associated with climate impacts.

The supply capabilities presented in Table 2-7 are based on Metropolitan's core supplies of programs within the Colorado River and SWP. Metropolitan's core water supplies are listed in Appendix 4 WSCP Table A.4-3. In addition, Metropolitan has numerous flexible supplies and storage programs within the Colorado River, SWP, and in-region that may be exercised as supply augmentation actions, if needed, consistent with the shortage response actions identified in Metropolitan's WSCP. The supply capabilities of Metropolitan's core, flexible, and storage programs for 2021 to 2025 are presented in detail in Appendix 3 Table A.3-8.

Total Water Supply and Use Comparison

Metropolitan's DRA is presented in Table 2-7 and provides a comparison of Metropolitan's total water supply and use for the next five years. This table is based on and is an abridged version of DWR's optional Planning Tool. Table 2-7 also includes DWR Submittal Table 7-5, Five-Year Drought Risk Assessment Table to Address Water Code Section 10635(b). Metropolitan's DRA uses annual total comparisons of its water supply and use. Developing the DRA using annual totals versus monthly values is most practicable for large wholesale suppliers, like Metropolitan, with core supply sources that are annually assessed and depend on unpredictable hydrology, such as the SWP, Colorado River, and availability of water transfers, among others.

Metropolitan's near-term assessment reveals that there could be a potential shortfall of core supplies in four of the next five years. This shortfall is largely triggered by the assumed low supply conditions from the SWP under a repeat of the historical condition of 1988 to 1992, which is modeled at 12% for 2021, 15% for 2023, 23% for 2024, and 18% for 2025. Actual supply conditions for the next five years may prove different from these historic supply conditions. This DRA illustrates Metropolitan's potential shortage response actions, if such a shortfall were to happen.

As detailed in Section 2.5 and Appendix 4, Metropolitan has a robust Water Shortage Contingency Plan and comprehensive shortage response planning that include demand reduction measures and supply augmentation actions. For years 2021, 2023, 2024, and 2025, the estimated shortfalls from the Colorado River and SWP core supplies are 432 TAF (Level 3), 388 TAF (Level 3), 23 TAF (Level 1) and 223 TAF (Level 2), respectively, with the corresponding WSCP shortage levels indicated in parentheses. Appendix 4 Table A.4-5 presents Metropolitan's response actions for the different shortage levels, which include take from Storage, execute Flexible Supplies, implement Voluntary Demand Reduction, and implement Water Supply Allocation Plan. Appendix 4 Table A.4-6 further identifies Metropolitan's supply augmentation actions that may be exercised to mitigate any potential shortage, including withdrawal from available flexible supplies and storage programs.

As detailed in Section 3 and Appendix 3, Metropolitan has built its dry-year and emergency storage through partnerships with various entities and investments in infrastructure. As of January 1, 2021, Metropolitan has 3.2 MAF in storage that may be used for dry-year needs, with estimated supply capacity to withdraw and deliver over 1 MAF to 1.4 MAF per year for the next five years. Because dry-year storage is at a record high, Metropolitan may only need to implement supply augmentation actions to meet the potential core supply shortfall. Supply augmentation actions may include exercising Metropolitan's flexible supplies and storage from the Colorado River, SWP, and in-region. In addition to supply augmentation, Metropolitan may also implement demand reduction and operational flexibility as part of its shortage response actions, to preserve storage or under scenarios where dry-year storage levels are not high. The factual shortage response actions, combination of actions selected, and volume of take from supply programs exercised all depend on the shortage that needs to be met, storage balance of the supply programs, program constraints, and other supply management considerations. With a potential core supply surplus estimated for year 2022, no water service reliability concern is anticipated, and no shortage response actions are expected to be exercised.

This DRA shows, under the assumptions described in this UWMP, that Metropolitan's total core, flexible, and storage supplies exceed the projected demand on Metropolitan for 2021 to 2025. This demonstrates Metropolitan's water service reliability for each year of the next five years under a repeat of the driest five-year historic sequence of Metropolitan's water supply. A graphical representation of the DRA is presented in Figure ES-2, as part of the Executive Summary. Metropolitan will periodically revisit its representation of both individual supply sources and of the gross water use estimated for each year and will revise its DRA if needed. A portion of Table 2-7 is also presented in Appendix 12 as new DWR Submittal Table 7-5.

1. Includes Metropolitan's core supplies as defined in WSCP in Appendix 4. Detailed Supply Worksheets are included in Appendix 3 Table A.3-8. Metropolitan may exercise supply augmentation actions from flexible and storage programs as response to any potential core supply shortfall using the 3.2 MAF of dry-year supplies currently in storage. In addition, Metropolitan may also implement demand reduction actions, if needed.
2. Maximum CRA deliveries limited to 1.25 MAF, including Exchange with SDCWA and US.

2.5 Water Shortage Contingency Plan

In addition to the water supply reliability analysis addressing normal, dry, and multiple dry water years, CWC Section 10632 requires urban suppliers to prepare and adopt a water shortage contingency plan which includes the shortage response actions that they would take in response to six standard water shortage levels. The Water Shortage Contingency Plan (WSCP) is Metropolitan's plan in the case of an actual water shortage condition. As illustrated in the preceding section's service reliability assessment, Metropolitan has the supply capabilities to meet projected demands during various hydrologic conditions. With such service reliability, Metropolitan's WSCP is part of its resiliency strategy to improve preparedness for droughts and other impacts on water supplies. In fulfillment of the Act's requirements, described below are the WSCP reporting elements which show how Metropolitan will manage and mitigate a water shortage. A copy of Metropolitan's WSCP is provided in Appendix 4.

Water Supply Reliability Analysis

CWC Section 10632(a)(1) directs the WSCP to include an "analysis of water supply reliability conducted pursuant to Section 10635." As shown in the water reliability assessment in Section 2.3, Metropolitan anticipates being able to meet water demands with adequate supplies across the single driest year and droughts lasting five consecutive water years scenarios through the year 2045. Metropolitan's DRA in Section 2.4. anticipates no water service reliability concerns or shortfall mitigation measures will be needed over the next five years, under a repeat of the historic driest five-year sequence of Metropolitan's water supply.

Annual Water Supply and Demand Assessment Procedures

Pursuant to CWC Section 10632(a)(2), Metropolitan must include in its WSCP the procedures used for conducting an annual Water Supply and Demand Assessment (Annual Assessment). The Annual Assessment is a determination of Metropolitan's annual outlook for water supply reliability, and how a perceived shortage may relate to WSCP shortage stage response actions in the current calendar year. This determination will be based on information available to Metropolitan at the time of the analysis. Starting in 2022, the Annual Assessment will be due by July 1 of every year. CWC Section 10632.1 states: "An urban water supplier that relies on imported water from the State Water Project or the Bureau of Reclamation shall submit its annual water supply and demand assessment within 14 days of receiving its final allocations, or by July 1 of each year, whichever is later." The Annual Assessment and related reporting are to be conducted based on the procedures described in the WSCP.

The Annual Assessment determination will be based on considerations of available core water supplies, unconstrained water demand, planned water use, and infrastructure conditions. The difference between projected core water supplies and anticipated unconstrained demand will be used to determine what, if any, shortage stage is expected under the WSCP framework. CWC Section10632(a)(2)(B)(ii) requires the Annual Assessment to determine "current year available supply, considering hydrological and regulatory conditions in the current year and one dry year." The Annual Assessment will include two separate estimations of Metropolitan's annual water supply and unconstrained demand using: 1) current year conditions and 2) assumed dry year conditions. Accordingly, the Annual Assessment's shortage analysis will present separate sets of findings for the current year and dry year scenarios. The CWC does not specify the characteristics of a dry year, allowing discretion to the Supplier. Metropolitan will use this discretion to refine and update its assumptions for a dry year scenario in each Annual Assessment as information becomes available.

By the month of June, Metropolitan staff will present a completed Annual Assessment for approval by Metropolitan's Board of Directors or by the Board's authorized designee with expressly delegated authority for approval of Annual Assessment determinations. This presentation to the decision-making body will include a request that the approval of the Annual Assessment determination also appropriately triggers any recommended specific shortage response actions resulting from the assessment. Upon approval, Metropolitan staff will then formally submit the Annual Assessment to the California Department of Water Resources by July 1.

Six Standard Water Shortage Levels

As required by CWC 10632(a)(3)(A), the WSCP is framed around six standard shortage levels that correspond to progressive ranges of up to 10, 20, 30, 40, and 50 percent shortages and greater than 50 percent shortages. Each of the six shortage levels represents an increasing gap between Metropolitan's estimated core supplies and unconstrained demand as determined in the Annual Assessment. Shortage levels also apply to catastrophic interruption of water supplies, including, but not limited to, a regional power outage, an earthquake, and other emergency events.

Shortage Response Actions

CWC 10632(a)(4) directs the WSCP to contain shortage response actions that align with the defined shortage levels, and include:

- Supply Augmentation Actions
- Demand Reduction Actions
- Operational Changes
- Additional, mandatory prohibitions against specific water use practices that are in addition to state-mandated prohibitions and appropriate to the local conditions (Not applicable to Metropolitan as a wholesaler with no retail customers)
- An estimate of the extent to which the gap between supplies and demand will be reduced by implementation of each action.

Metropolitan has invested extensively in a diverse portfolio of supply sources and system resiliency to prepare for a wide range of possible challenging conditions. Metropolitan follows the principles of its Water Surplus and Demand Management (WSDM) Plan, which was adopted in 1999 and provides policy guidance for managing regional water supplies to achieve reliability.

Shortage responses will be customized to meet the circumstances for the particular shortage. Because circumstances can change at any time, Metropolitan's shortage responses actions will be adjusted accordingly throughout the year. To determine specific actions that would be taken at each standard shortage level, Metropolitan will evaluate conditions specific to cost, timing, distribution needs and capabilities, and other variables that include SWP allocation, Colorado River conditions, preexisting demand reduction measures, supply program take capacities, and storage balances.

Supply augmentation actions are comprised of Metropolitan's portfolio of water storage reserves and flexible supply sources that are available on an as-needed basis, such as water from its storage facilities and from transfer and exchange programs. Demand reduction actions are temporary measures that can constrain demand in the current year, such as public information campaigns and mandatory allocations. Operational flexibility actions are an acknowledgement that Metropolitan will adjust its operations as needed during shortages. These adjustments may include temporarily deferring or accelerating scheduled maintenance and planned shutdowns or adjusting the distribution system to compensate for limitations in Colorado River or State Water Project water.

Shortages are characterized not merely by shortfalls in annual core water supplies, but also by the water balances in Metropolitan's storage programs. Thus, a 10 percent or even a 50 percent shortfall in core supplies could be met entirely with stored water if storage levels are sufficient to meet demand. If storage levels are already depleted, the same shortfall in core supplies could potentially require a more complex mix of supply augmentation and demand reduction actions. During most years, Metropolitan anticipates that it can meet all or most shortages with supply augmentation actions. Depending on intensity, voluntary demand reduction measures are estimated to reduce retail water usage by up to 20 percent. In the most severe situations, allocating shortages to member agencies through the Water Supply Allocation Plan (WSAP) would address any remaining shortages not already mitigated by supply augmentation and lesser demand reduction actions.

Communication Protocols

Metropolitan's WSCP Communication Plan details Metropolitan's action-oriented strategy for education, outreach, and coordination during each WSCP standard shortage stage and in response to a catastrophic loss of supply. The WSCP Communications Plan provides messaging strategies that would be implemented at each level, leading up to more focused crisis communication strategies. It emphasizes the need for plans to be adaptable and that Metropolitan management and/or Board of Directors could also call for specific messaging strategies that address unique shortage scenarios.

Compliance and Enforcement

This WSCP reporting element is required for urban retail suppliers only.

Legal Authorities

Metropolitan is a wholesale water provider organized as a cooperative of 26 voluntary members. Metropolitan was formed pursuant to the Metropolitan Water District Act, Statutes 1969, chapter 209, codified at California Water Code, Appendix Section 109 (the "MWD Act"). Pursuant to the MWD Act, Metropolitan has the express and implied statutory authority to "[p]rovide, sell, and deliver water at wholesale for municipal and domestic uses and purposes," among other powers. (MWD Act, §§ 120, 130.) To accomplish the provision of water, Metropolitan is also expressly authorized to promote and implement conservation programs, including during times of water shortage. (MWD Act, § 130.5.)

Metropolitan also has authority under the California Water Code to implement supply shortage programs. (Cal. Water Code, §§ 350-359, 375-378.) For example, Section 375(a) of the Water Code provides:

Notwithstanding any other provision of the law, any public entity which supplies water at retail or wholesale for the benefit of persons within the service area or area of jurisdiction of the public entity may, by ordinance or resolution adopted by a majority of the members of the governing body after holding a public hearing upon notice and making appropriate findings of necessity for the adoption of a water conservation program, adopt and enforce a water conservation program to reduce the quantity of water used by those persons for the purpose of conserving the water supplies of the public entity.

Cal. Water Code, § 375(a). Water Code Section 375(b) also provides the authority for pricing to encourage water conservation.

Metropolitan's Board of Directors has approved many policies and rules, codified in Metropolitan's own Administrative Code, which further provide Metropolitan the authority to ensure the availability of its water during times of shortages. For example, Administrative Code Section 3107 requires that any territory annexed to Metropolitan comply with Metropolitan's water use efficiency guidelines.

The Board has also ratified various policies and rules to implement a Water Supply Allocation Plan (WSAP) to address shortage conditions. Metropolitan's WSAP provides a standardized methodology for allocating supplies during times of shortage. The WSAP is authorized pursuant to the following Board actions:

- By Minute Item 43514, dated April 13, 1999, the Board adopted the Water Surplus and Drought Management Plan.
- By Minute Item 44005, dated June 17, 2000, the General Manager has the authority to reduce Interim Agriculture Water Program deliveries up to 30 percent prior to imposing any mandatory allocation under the Water Surplus and Drought Management Plan.
- By Minute Item 47393, dated February 12, 2008, the Board adopted the Water Supply Allocation Plan.
- By Minute Item 48376, dated August 17, 2010, the Board approved adjustments to the Water Supply Allocation Plan.
- By Minute Item 48803, dated September 12, 2011, the Board approved adjustments to the Water Supply Allocation Plan.
- By Minute Item 74526, dated February 11, 2014, the Board adopted the Water Supply Alert Resolution.
- By Minute Item 49979, dated December 9, 2014, the Board approved adjustments to the Water Supply Allocation Plan.

In addition to the statutes and other legal authorities set forth above, Metropolitan is empowered to implement and enforce its shortage response actions pursuant to various resolutions. For example, on April 11, 2016, Metropolitan's Board voted to adopt Metropolitan's 2015 UWMP and authorized its submittal to the State of California as stated in Resolution 9209. Metropolitan's 2015 UWMP contains Metropolitan's December 2014 Water Supply Allocation Plan in Appendix 4. Metropolitan's 2015 UWMP also describes in Section 2.4 Metropolitan's WSAP and Water Surplus and Drought Management (WSDM) Plan, which guide Metropolitan's planning and operations during both shortage and surplus conditions. Similarly, on May 11, 2021, Metropolitan's Board voted to adopt Metropolitan's UWMP and WSCP as stated in Resolutions 9279 and 9281, respectively. These two Resolutions authorize Metropolitan to implement and enforce its shortage response actions contained in the WSCP, which is attached as Appendix 4 to the UWMP.

Additionally, numerous agreements allow Metropolitan to take its shortage response actions. Supply augmentation actions are authorized by the agreements shown in Appendix 3 of the 2020 UWMP: Justifications for Supply Projections.

If necessary, Metropolitan shall declare a water shortage emergency in accordance with CWC Chapter 3 (commencing with Section 350) of Division 1. In addition, Metropolitan shall coordinate with any city or county within which it provides water supply services for the possible proclamation of a local emergency, as defined in Government Code Section 8558.

Financial Consequences of WSCP

A water shortage may be created by either a reduction in water supply, or an increase in water demand, or a combination of both. Metropolitan's shortage response actions include supply augmentation, demand management, and operational flexibility, all of which could impact Metropolitan financially. From these financial effects, there is a potential for expenditures exceeding revenues more than budgeted, thereby requiring unanticipated draws from reserves.

Variation in the amount of revenues is already part of Metropolitan's financial planning. Revenues vary according to regional weather and the availability of statewide water supplies. In dry years, local demands increase, and Metropolitan may receive higher than anticipated revenues due to increased sales volumes. In contrast, in wet years, demands decrease, and revenues drop due to lower sales volumes. In addition, statewide supply shortages such as those in 2009 and 2015 also affect Metropolitan's revenues. Such revenue surpluses and shortages could cause instability in water rates. To mitigate this risk, Metropolitan maintains financial reserves, with a minimum and target balance, to stabilize water rates during times of reduced water sales. The reserves hold revenues collected during times of high water sales and are used to offset the need for revenues during times of low sales. Metropolitan's practice of using reserves to buffer unexpected increases or decreases in budgeted revenue also applies to unexpected expenditure increases or decreases resulting from shortage responses.

Metropolitan uses its financial reserves to mitigate the impacts of water shortages. This policy applies to each of the six shortage levels described in the WSCP. Financial reserves create a buffer to reduce the financial impact of the water shortage. Other mitigation actions such as reducing O&M expenses, deferring Capital Improvement Projects, and rates/charges increases are part of Metropolitan's biennial budget and rate design cycle and are not used routinely to mitigate financial impacts of water shortage response actions.

Metropolitan's reserve policy provides for a minimum reserve requirement and target amount of unrestricted reserves at June 30 of each year. Funds in excess of the target amount are to be utilized for capital expenditures in lieu of the issuance of additional debt, or for the redemption, defeasance or purchase of outstanding bonds or commercial paper as determined by the Board. However, if the fixed charge coverage ratio (the amount necessary to cover all fixed costs) is at or above 1.2, amounts over the minimum may be expended for any lawful purpose of Metropolitan, as determined by the Board. Therefore, unrestricted reserves are available to address Metropolitan's shortage response actions, as well as the consequences of those actions, so long as its fixed charge coverage ratio is at or above 1.2.

Monitoring and Reporting

This WSCP reporting element is required for urban retail suppliers only.

WSCP Reevaluation and Improvement

The WSCP will be periodically re-evaluated to ensure that its shortage response actions are effective and up to date based on lessons learned from implementing the WSCP. The WSCP will be revised and updated during the UWMP update cycle to incorporate updated and new information. For example, new supply augmentation actions will be added, and actions that are no longer applicable for reasons such as program expiration will be removed. However, if significant revisions are warranted, the WSCP will be updated outside of the UWMP update cycle. In the course of preparing the Annual Assessment each year, Metropolitan staff will routinely consider the functionality of the overall WSCP and will prepare recommendations for Metropolitan's Board of Directors if changes are found to be needed.

Relationship with other Metropolitan Shortage Planning

The WSCP is designed to be consistent with the Water Shortage and Demand Management (WSDM) Plan, Water Supply Allocation Plan (WSAP), and other emergency planning efforts as described below. WSDM Plan principles guide the specific actions to be taken under WSCP shortage stages. Data collection, continual analysis, and monthly reporting processes of WSDM Plan implementation will form the basis for Metropolitan's Annual Water Supply Demand Assessment that will be provided annually to the state beginning in July 2022. The WSAP is integral to the WSCP's shortage response strategy in the event that Metropolitan determines that supply augmentation (including storage) and lesser demand reduction measures would not be sufficient to meet a projected shortage.

Water Surplus and Drought Management Plan

Metropolitan's Board adopted the WSDM Plan in April 1999, which provides policy guidance for managing regional water supplies to achieve the reliability goals of the IRP and identifies the expected sequence of resource management actions that Metropolitan will execute during surpluses and shortages to minimize the probability of severe shortages and reduce the possibility of extreme shortages and shortage allocations. Unlike Metropolitan's previous shortage management plans, the WSDM Plan recognizes the link between surpluses and shortages, and it integrates planned operational actions with respect to both conditions.

WSDM Plan Development

Metropolitan and its member agencies jointly developed the WSDM Plan during 1998 and 1999. This planning effort included more than a dozen half-day and full-day workshops and more than three dozen meetings between Metropolitan and member agency staff. The result of the planning effort is a consensus plan that addresses a broad range of regional water management actions and strategies.

WSDM Plan Principles and Goals

The guiding principle of the WSDM Plan is to manage Metropolitan's water resources and management programs to maximize management of wet year supplies and minimize adverse impacts of water shortages to retail customers. From this guiding principle came the following supporting principles:

- Encourage efficient water use and economical local resource programs
- Coordinate operations with member agencies to make available as much surplus water as possible for use in dry years
- Pursue innovative transfer and banking programs to secure more imported water for use in dry years
- Increase public awareness about water supply issues

The WSDM Plan also declared that if mandatory import water allocations become necessary, they would be calculated on the basis of need, as opposed to any type of historical purchases. The WSDM Plan contains the following considerations that would go into an allocation of imported water:

- Impact on retail consumers and regional economy
- Investments in local resources, including recycling and conservation
- Population growth

- Changes and/or losses in local supplies
- Participation in Metropolitan's non-firm (interruptible) programs
- Investment in Metropolitan's facilities

WSDM Plan Implementation

Each year, Metropolitan evaluates the level of supplies available and existing levels of water in storage to determine the appropriate management stage. Each stage is associated with specific resource management actions designed to: (1) avoid an Extreme Shortage to the maximum extent possible; and (2) minimize adverse impacts to retail customers if an Extreme Shortage occurs. The current sequencing outlined in the WSDM Plan reflects anticipated responses based on detailed modeling of Metropolitan's existing and expected resource mix.

Surplus Stages

Metropolitan's supply situation is considered to be in surplus as long as net annual deliveries can be made to water storage programs. The WSDM Plan further defines four surplus management stages that guide the storage of surplus supplies in Metropolitan's storage portfolio. Deliveries for storage in DVL and in SWP terminal reservoirs continue through each surplus stage provided there is available storage capacity. Withdrawals from DVL for regulatory purposes or to meet seasonal demands may occur in any stage. Deliveries to other storage facilities may be interrupted, depending on the amount of the surplus.

Shortage Stages

The WSDM Plan distinguishes between Shortages, Severe Shortages, and Extreme Shortages. Within the WSDM Plan, these terms have specific meanings relating to Metropolitan's ability to deliver water to its member agency customers.

Shortage: Metropolitan can meet full-service demands and partially meet or fully meet interruptible demands, using stored water or water transfers as necessary.

Severe Shortage: Metropolitan can meet full-service demands only by using stored water, transfers, and possibly calling for extraordinary conservation.

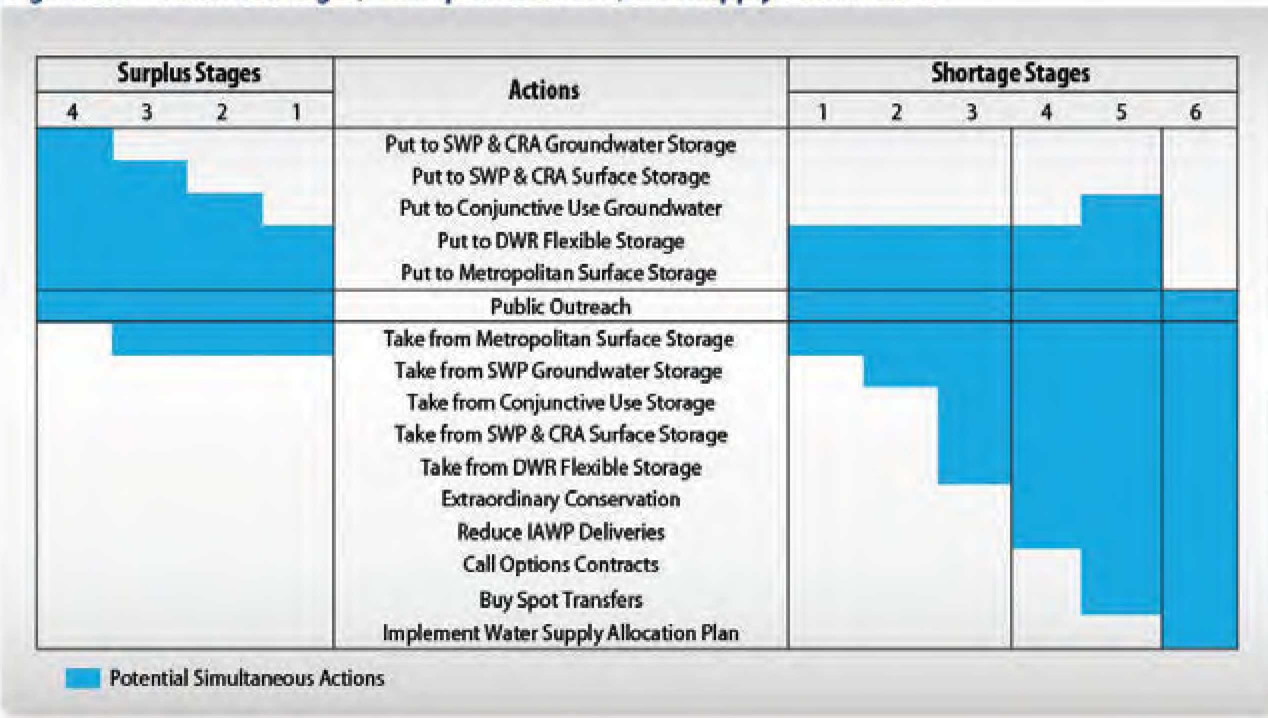
Extreme Shortage: Metropolitan allocates available supply to full-service customers.

The WSDM Plan also defines six shortage management stages to guide resource management activities. These stages are not defined merely by shortfalls in imported water supply, but also by the water balances in Metropolitan's storage programs. Thus, a 10 percent shortfall in imported supplies could be a stage one shortage if storage levels are high. If storage levels are already depleted, the same shortfall in imported supplies could potentially be defined as a more severe shortage.

When Metropolitan must make net withdrawals from storage to meet demands, it is considered to be in a shortage condition. Under most of these stages, Metropolitan is still able to meet all end-use demands for water. For shortage stages 1 through 3, Metropolitan will meet demands by withdrawing water from storage. At shortage stages 4 and 5, Metropolitan may undertake additional shortage management steps, including issuing public calls for extraordinary conservation and exercising water transfer options, or purchasing water on the open market.

Figure 2-1 shows the actions under surplus and shortage stages and when an allocation plan would be necessary to enforce mandatory cutbacks. The overriding goal of the WSDM Plan is to avoid reaching Shortage Stage 6, an Extreme Shortage.

Figure 2-1 Resource Stages, Anticipated Actions, And Supply Declarations



Water Supply Allocation Plan

The WSAP provides a formula for allocating available water supplies to the member agencies in case of extreme water shortages within Metropolitan's service area. The WSAP was approved by Metropolitan's Board in February 2008 and has since been implemented three times, most recently in April 2015. The WSAP was developed in consideration of the principles and guidelines described in the WSDM Plan, with the objective of creating an equitable needs-based allocation. The WSAP formula seeks to balance the impacts of a shortage at the retail level for shortages of Metropolitan supplies of up to 50 percent. The formula takes into account growth, local investments, changes in supply conditions, and the demand hardening aspects of non-potable recycled water use and the implementation of conservation savings programs.

<u>Water Supply Allocation Plan Development</u>

Between July 2007 and February 2008, Metropolitan staff worked jointly with Metropolitan's member agencies to develop the WSAP. Throughout the development process, Metropolitan's Board was provided with regular progress reports on the status of the WSAP. The WSAP was adopted at the February 12, 2008 Board meeting. Since the WSAP's adoption in 2008, Metropolitan has worked extensively with the member agencies to periodically review the WSAP formula. Following Board-directed formal review of the WSAP at 12 months after initial implementation and at 3 years after initial adoption, the Board approved adjustments to the WSAP formula on August 17, 2010, and September 13, 2011. In light of drought conditions, Metropolitan staff convened a member agency working group between July and November 2014 to revisit the WSAP before possible implementation in 2015. On December 9, 2014, the Board approved additional adjustments to the formula.

The WSAP Formula

The WSAP formula is calculated in three steps: base period calculations, allocation year calculations, and supply allocation calculations. The first two steps involve standard computations, while the third step contains specific methodology developed for the WSAP.

Step 1: Base Period Calculations

The first step in calculating a water supply allocation is to estimate water supply and demand using a historical base period with established water supply and delivery data. The base period for each of the different categories of demand and supply is calculated using data from fiscal years (July through June) ending 2013 and 2014.

Step 2: Allocation Year Calculations

The next step in calculating the water supply allocation is estimating water needs in the allocation year. This is done by adjusting the base period estimates of retail demand for population growth and changes in local supplies.

Step 3: Supply Allocation Calculations

The final step is calculating the water supply allocation for each member agency based on the allocation year water needs identified in Step 2. There are a number of adjustments that go into a member agency's water supply allocation. Each element and its application in the allocation formula are discussed in detail in Metropolitan's WSAP.

Annual Reporting Schedule on Supply/Demand Conditions

Managing Metropolitan's water supply resources to minimize the risk of shortages requires timely and accurate information on changing supply and demand conditions throughout the year. To facilitate effective resource management decisions, the WSDM Plan includes a monthly schedule for providing supply/demand information to Metropolitan's senior management and Board, and for making resource allocation decisions. Table 2-8 shows this schedule.

Table 2-8
Schedule of Reporting and Water Supply Allocation Decision-Making

Month	Information Report/Management Decision
January	Initial supply/demand forecasts for year
February - March	Update supply/demand forecasts for year
April - May	Finalize supply/demand forecasts Management decisions re: Contractual Groundwater and Option Transfer Programs Board decision re: Need for Extraordinary Conservation
October - December	Report on Supply and Carryover Storage

Catastrophic and Emergency Planning

As part of the WSCP, the CWC requires urban suppliers to plan for catastrophic interruption of water supplies, including, but not limited to, a regional power outage, an earthquake, and other potential emergency events. In addition, CWC Section 10632.5 further requires urban water suppliers to develop a seismic risk assessment and mitigation plan to assess the vulnerability of each of the various facilities of a water system and mitigate those vulnerabilities. For Metropolitan, these required planning elements are captured in the analyses that went into developing its Emergency Storage Objective, Seismic Resiliency Reports, and Emergency Response Plans. Elements of these Metropolitan analyses are summarized below.

Emergency Storage Objective

Metropolitan established its original criteria for determining emergency storage requirements in the October 1991 Final Environmental Impact Report for the Eastside Reservoir, which is now named Diamond Valley Lake. These criteria were again discussed in the 1996 IRP. Metropolitan's Board approved both of these documents. Emergency storage requirements are based on the potential of a major earthquake that would damage all supply aqueducts isolating Southern California from its imported water sources.

In 2019, Metropolitan and its member agencies completed a collaborative process to update the regional planning estimate of Metropolitan's Emergency Storage Objective. This emergency storage represents the amount of water that Metropolitan would store for the region in preparation for a catastrophic earthquake that would damage the aqueducts that transport imported water supplies to Southern California, including: the Colorado River Aqueduct, both the East and West branches of the California Aqueduct, and the Los Angeles Aqueduct.

The emergency storage allows Metropolitan to deliver reserve supplies to the member agencies to supplement local production. This helps avoid severe water shortages during periods when the imported water aqueducts may be out of service. The Emergency Storage Objective considers a six- and twelve-month outage period for the imported supply aqueducts incorporating latest seismic information and operational flexibility of Metropolitan's system, a retail water demand cutback ranging from 25 to 35 percent considering the level of conservation that the region achieved during the recent drought, and an aggregated loss of 10 to 20 percent of local supplies accounting for factors that could affect local production during emergency conditions.

Under this update, Metropolitan's Emergency Storage Objective was set to 750 TAF, as this level of storage would prevent severe water shortages to the region given new information on expected recovery durations. The emergency storage volume represents a planning estimate for the amount of water that Metropolitan would store for the region in preparation for a catastrophic earthquake or other disaster. It is not intended to set a basis or a policy for allocating or apportioning storage for any individual member agency. The detailed description of Metropolitan's Emergency Storage Objective is included in Appendix 8.

Emergency Freshwater Pathway (Sacramento-San Joaquin Delta)

It has been estimated by the California Department of Water Resources (DWR) that in the event of a major earthquake in or near the Delta, water supplies could be interrupted for up to three years, posing a significant and unacceptable risk to the California business economy. A post-event strategy would provide necessary water supply protections to avert this catastrophe. Such a plan has been coordinated through DWR, Corps of Engineers (Corps), Bureau of Reclamation (Reclamation), California Office of Emergency Services (Cal OES), Metropolitan, and the State Water Contractors.

<u>DWR Delta Flood Emergency Management Plan</u>

The Delta Flood Emergency Management Plan (DWR, 2018) provides strategies for response to Delta levee failures, up to and including earthquake-induced multiple island failures during dry conditions when the volume of flooded islands and saltwater intrusion are large, resulting in curtailment of export operations. Under these severe conditions, the plan includes a strategy to establish an emergency freshwater pathway from the central Delta along Middle River and Victoria Canal to the export pumps in the south Delta. The plan includes the prepositioning of emergency construction materials at existing and new stockpile and warehouse sites in the Delta, and development of tactical modeling tools (DWR Emergency Response Tool) to predict levee repair logistics, timelines of levee repair and suitable water quality to restore exports. The Delta Flood Emergency Management Plan has been extensively coordinated with state, federal and local emergency response agencies. DWR, in conjunction with local agencies, the Corps and Cal OES, conduct tabletop and field exercises to test and revise the plan under real time conditions.

DWR and the Corps provide vital Delta region response to flood and earthquake emergencies, complementary to Cal OES operations. These agencies perform under a unified command structure and response and recovery framework. The Northern California Catastrophic Flood Response Plan (Cal OES, 2018) incorporates the DWR Delta Flood Emergency Management Plan. The Delta Emergency Operations Integration Plan (DWR and USACE, 2019) integrates personnel and resources during emergency operations.

Pathway Implementation Timeline

The Delta Flood Emergency Management Plan has found that using pre-positioned stockpiles of rock, sheet pile and other materials, multiple earthquake-generated levee breaches and levee slumping along the freshwater pathway can be repaired in less than six months. A supplemental report (Levee Repair, Channel Barrier and Transfer Facility Concept Analyses to Support Emergency Preparedness Planning, M&N, August 2007) evaluated among other options, the placement of sheet pile to close levee breaches, as a redundant method if availability of rock is limited by possible competing uses. The stockpiling of sheet pile is vital should more extreme emergencies warrant parallel and multiple repair techniques for deep levee breaches. Stockpiles of sheet pile and rock to repair deep breaches and an array of levee slumping restoration materials are stored at DWR and Corps stockpile sites and warehouses in the Delta.

Emergency Stockpile Sites and Materials

DWR has acquired lands at Rio Vista and Stockton as major emergency stockpile sites, which are located and designed for rapid response to levee emergencies. The sites provide large loading facilities, open storage areas and new and existing warehousing for emergency flood fight materials, which augment existing warehousing facilities throughout the Delta. The Corps maintains large warehousing facilities in the Delta to store materials for levee freeboard restoration, which can be augmented upon request of other stockpiles in the United States. Pre-positioned rock and sheet pile are used for closure of deep levee breaches. Warehoused materials for rapid restoration of slumped levees include muscle (k-rail) walls, super sacks, caged rock containers, sandbags, stakes and plastic tarp. Stockpiles will be augmented as materials are used.

Emergency Response Drills

Earthquake-initiated multiple island failures will mobilize DWR and Corps resources to perform Delta region flood fight activities within an overall Cal OES framework. In these events, DWR and the Corps integrate personnel and resources to execute flood fight plans through the Delta Emergency Operations Integration Plan (DWR and USACE, 2019). DWR, the Corps and local agencies perform emergency exercises focusing on communication readiness and the testing of mobile apps for information collection and dissemination. The exercises train personnel and test the readiness of emergency preparedness and response capabilities under unified command, and provide information to help to revise and improve plans.

Levee Improvements and Prioritization

The DWR Delta Levees Subventions and Special Projects Programs have prioritized, funded and implemented levee improvements along the emergency freshwater pathway and other water supply corridors in the central and south Delta. These efforts are complementary to the Delta Flood Emergency Management Plan, which along with pre-positioned emergency flood fight materials, ensures reasonable seismic performance of levees and timely pathway restoration after a severe earthquake. These programs have been successful in implementing a coordinated strategy of emergency preparedness to the benefit of SWP and CVP export systems.

Significant improvements to the central and south Delta levees systems along Old and Middle Rivers began in 2010 and are continuing to the present time. This complements substantially improved levees at Mandeville and McDonald Islands and portions of Victoria and Union Islands. Levee improvements along the Middle River emergency freshwater pathway and Old River consist of crest raising, crest widening, landside slope fill and toe berms, which improve seismic stability, reduce levee slumping and create a more robust flood-fighting platform. Urban agencies, including Metropolitan, Contra Costa Water District, East Bay Municipal Utility District, and others have participated in levee improvement projects along or near the Old and Middle River corridors.

SWP Seismic Improvement

DWR's recent SWP seismic resiliency efforts have focused heavily on SWP Dam Safety. The most prominent is the joint USBR/DWR corrective action study of Sisk Dam which will result in a massive seismic stability alteration project - to begin next year. Similarly, Perris Dam had a major foundation modification and stability berm added to the downstream face which has resulted in the removal of the DSOD imposed storage restriction. Several analyses have been conducted on SWP dam outlet towers/access bridges which has resulted in seismic upgrades (some completed/some on-going). Updated dam seismic safety evaluations are being performed on the Oroville Dam embankment and the radial gate control structure on the flood control spillway.

In addition to the dam safety elements, DWR has procured and stockpiled spare pipe sections for the SBA to increase recovery times following seismic induced damage (as part of the 2015 South Bay Aqueduct Reliability Improvement Project). Seismic retrofits have also been completed on 23 SWP bridges located in four Field Divisions with additional retrofits in various development stages. DWR has also updated the earthquake notification procedures and has replaced and expanded instrumentation for the SWP's seismic network.

Electrical Outages

Metropolitan has also developed contingency plans that enable it to deal with both planned and unplanned electrical outages. These plans include the following key points:

- In event of power outages, water supply can be maintained by gravity feed from regional reservoirs such as DVL, Lake Mathews, Castaic Lake, and Silverwood Lake.
- Maintaining water treatment operations is a key concern. As a result, all Metropolitan treatment plants have at least two emergency generators capable of operating the treatment plant in the event of supply failure on the main electrical grid. These generators will automatically operate when power from the grid is interrupted, and annual testing is conducted to ensure they are operational and reliable. In addition, within the water treatment plants there are also dual electrical systems for all critical facilities (e.g., chemical feed systems) to provide redundancy and resiliency.

- Valves at Lake Skinner can be operated by the backup generation at the Lake Skinner treatment plant.
- Metropolitan owns mobile generators that can be transported quickly to key locations, such as reservoir Intake/outtake structures, if necessary.
- The CRA electric transmission system can supply power to the five CRA pumping plants from three independent power sources: Mead 230kV substation located near Hoover Dam; Parker Dam 230kV substation near Gene; and from interconnections with Southern California Edison. These multiple locations where Metropolitan's 230 kV transmission system interconnects to the regional transmission grid provide a redundant path to bring 230 kV power to Hinds, Eagle Mountain, Iron Mountain and Gene Pumping Plants. In addition to redundant paths of power to each CRA pumping plant, the CRA electric transmission system has dual lines from the 230 kV Mead substation and multiple disconnect switches and circuit breakers. This improves the flexibility of the CRA electric transmission system to isolate portions of the system for maintenance or repairs and re-route power from the three independent power sources to the pumping plants while repairs are executed.

Seismic Risk Assessment and Mitigation Plan

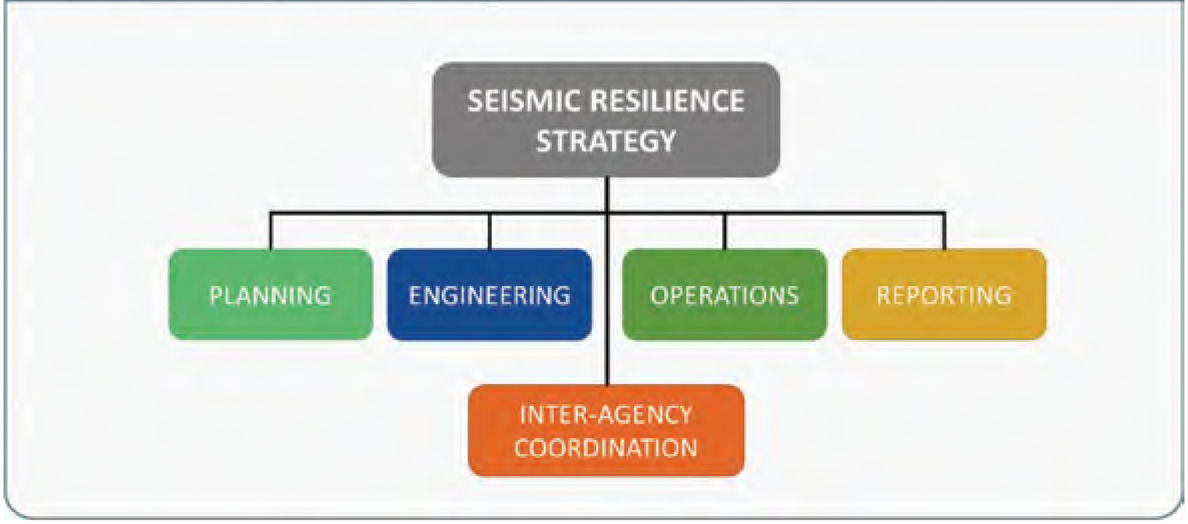
Beginning January 2020, CWC Section 10632.5 mandates UWMPs to include a seismic risk assessment and mitigation plan to assess the vulnerability of each of the various facilities of a water system and mitigate those vulnerabilities. For Metropolitan, the required assessment and plan are accomplished as part of developing its resilience strategy and are presented in detail in its seismic resiliency reports. This section provides a summary of the various components of Metropolitan's resilience strategy. These components are described in detail in Metropolitan's Seismic Resilience Report First Biennial Report (February 2018) and Seismic Resilience Report 2020 Update (February 2020) presented as part of Appendix 9.

Over its nearly 90-year history, Metropolitan has been proactive in mitigating seismic risks posed to its expansive infrastructure, as well as improving its ability to maintain (or quickly restore) water deliveries following a major earthquake. This ability to mitigate seismic risks and maintain (or quickly restore) water deliveries following a seismic event is referred to as "seismic resilience." Metropolitan's holistic strategy for seismic resilience follows a "defense in depth" multi-layered approach for managing risk. Metropolitan's Seismic Resilience Strategy has three primary objectives:

1. Provide a diversified water supply portfolio, system flexibility, and emergency storage
2. Prevent damage to water delivery infrastructure in probable seismic events and limit damage in extreme events
3. Minimize water delivery interruptions through a dedicated emergency response and recovery organization

Metropolitan's Seismic Resilience Strategy is implemented through four components that encompass the various internal functions that promote Metropolitan's seismic resilience objectives. These components are supplemented by Metropolitan's commitment to inter-agency coordination when preparing and responding to a seismic event and other emergencies. The strategy is shown below in Figure 2-2.

Figure 2-2 Seismic Resilience Strategy



A brief description of the components of Metropolitan's Seismic Resilience Strategy and examples of their implementation are provided below.

Planning

The goals of the planning component are to develop and maintain a diversified water resource portfolio; provide a flexible system that allows for operational changes to handle variations in water supply, planned or unplanned system outages; and to maintain adequate emergency storage supplies. Metropolitan has developed a diverse water resource portfolio through the enactment of various exchange and water banking programs. These water supply programs are described in detail in Section 3 and Appendix 3. In addition to existing supply programs, development of the Regional Recycled Water Program would provide Metropolitan with an additional water resource and would be strategically located on the coastal side of the San Andreas Fault. Metropolitan also strives for regional seismic resilience by incentivizing local agencies to develop increased conservation, recycling, storage, and other water management programs.

As Metropolitan expanded its system over the years, it has continually improved the flexibility of the system to handle changes in water supply or pipeline or facility outages. One example of Metropolitan's system flexibility is the Common Pool service area, which can be supplied by the Jensen, Weymouth, or Diemer water treatment plants. Additionally, Metropolitan has constructed its system such that most of the service area can be supplied by either Colorado River or State Water Project supplies.

Metropolitan's imported water supplies from the CRA and SWP East and West Branches cross the San Andreas Fault (SAF) Zone prior to reaching Metropolitan's service area. A major earthquake on the SAF has the potential of damaging all three aqueducts and disrupting imported supplies for up to six months. Metropolitan constructed Diamond Valley Lake (DVL) on the coastal side of the fault to mitigate the potential impacts of a major SAF earthquake to its service area. Completion of DVL nearly doubled Metropolitan's available surface water storage in the region and, along with other local reservoirs, is used to maintain 6 to 12 months of emergency water storage supply. Water from DVL can supply 4 of Metropolitan's 5 regional water treatment plants.

Engineering

The goal of the engineering component is to assess and mitigate seismic risk to individual facilities and the system. This is accomplished through Metropolitan's Seismic Resilience of Structures Program, the Seismic Resilience of Pipelines Program, the Dam Safety Program, and through special seismic assessments.

Seismic Resilience of Structures

Metropolitan's program to increase the seismic resilience of structures is an ongoing program with the goal of protecting life safety and critical infrastructure to minimize water delivery interruptions following a seismic event. The initial program focused on evaluating the seismic risk of above ground structures (e.g. water treatment plants) constructed prior to 1990 and upgrading structures to mitigate the risk when found to be seismically deficient. The program has recently expanded to include post-1990 structures due to the progress made on the initial list of structures. Examples of seismically upgraded facilities include the Colorado River Aqueduct pump plant buildings, the Weymouth East and West Wash Water Tanks, and the Diemer and Jensen Administration Buildings.

Seismic Resilience of Pipelines

Metropolitan's conveyance and distribution system has been built in conformance with standards and practice at the time of design. In keeping with the goals of the Seismic Resilience Strategy, Metropolitan is developing seismic design criteria for new pipelines based on current state of practice, geotechnical and seismicity criteria, operating conditions, and asset management strategies. The planned design approach for new pipelines will be to establish performance criteria, identify seismicity and ground conditions along the alignment, and design the pipeline to resist damage from ground shaking and deformation. Specialized pipe joints and sections can be designed to accommodate ground deformation from fault displacement or liquefaction. For existing pipelines, seismic resilience will be incorporated as a component of pipeline rehabilitation projects. Metropolitan will evaluate each upgrade individually to balance risk, performance, and cost. Metropolitan's Casa Loma Siphon Barrel No. 1 Seismic Upgrade Project is an example of Metropolitan incorporating seismic design in the rehabilitation of existing pipelines. The existing siphon, which crosses a segment of the San Jacinto Fault Zone and is subject to long-term subsidence, will be replaced with earthquake-resistant ductile iron pipe. The pipe joints are designed to accommodate ground displacement without failure to allow for continued service following an earthquake.

Dam Safety Program

Metropolitan has an ongoing Dam Safety Initiatives Program that has initiated several plans to improve Metropolitan's dam seismic safety and earthquake readiness. These initiatives are being coordinated with the California Division of Safety of Dams (DSOD) and Office of Emergency Services and include the following:

- Ongoing preparation of Emergency Action Plans, including inundation maps
- Performing training exercises at the dam site to test processes during a seismic event
- Providing training and guidance on overall dam safety
- Reviewing operation and maintenance methods for reservoir drawdown and operations after a seismic event
- Updating guidelines and procedures on protection against seismic risk
- Establishing a strong communications system on seismic information

- Performing structural strengthening of dams, including rehabilitation and improvement of spillways and inlet/outlet towers such as Lake Skinner Outlet Tower
- Improving dam safety instrumentation, monitoring, and reporting capabilities

Special Seismic Assessments

Metropolitan conducts special seismic assessments to increase understanding of the vulnerability of Metropolitan's assets and operations to various seismic hazards. The studies focus on hazards specific to individual facilities or the system as a whole and identify options to mitigate the risks posed by the hazards. In addition, the studies support emergency response training and planning for future earthquake events by estimating the magnitude of damage that may occur from various seismic events. The following is a list of some of the reports that Metropolitan has completed.

- Liquefaction Susceptibility Mapping for the Metropolitan Water District of Southern California's Feeder System (Report No. 1625), Carollo Engineers, Inc., 2019.
- Colorado River Aqueduct – San Gorgonio Pass Seismic Event Vulnerability Study (Report No. 1484), GeoPentech, July 2014.
- Potential Effects of Southern California Seismic Events on Metropolitan Water Deliveries (Report No. 1335), Metropolitan Facility Planning staff, January 2009.

Operations

The goal of the operations component is to maintain effective emergency planning and response capabilities. This is accomplished through maintaining an effective Emergency Response Organization, conducting routine emergency response training exercises and maintaining emergency construction capabilities.

Metropolitan's Emergency Response Organization (ERO) is comprised of over 200 predesignated employees who work in the Emergency Operations Center (EOC), the Incident Command Posts, or in the field during emergencies. ERO staff has completed specialized training that meets state and federal requirements. Metropolitan's emergency response structure follows the National Incident Management System (NIMS) and the State of California's Standardized Emergency Management System (SEMS).

In addition to specialized NIMS training, Metropolitan staff routinely participate in emergency response training exercises that are often based on a postulated seismic event. In 2019, Metropolitan started a new five-year emergency exercise plan that will allow all member agencies to participate in at least one of Metropolitan's annual emergency exercises. The first of these exercises was a tabletop exercise for the Orange County member agencies on August 29, 2019, which focused on a hypothetical incident at the Diemer Water Treatment Plant.

Metropolitan has conducted over 100 exercises since February 2018. This included two large functional emergency exercises for the EOC and multiple tabletop exercises, workshops, and seminars for the 12 Incident Command Posts located at the water treatment plants, conveyance and distribution facilities, and other strategic locations in Metropolitan's service area.

Metropolitan maintains the necessary staffing, materials, and equipment to respond to two simultaneous pipeline breaks. The Machine Shop and Coating Shop at La Verne are available to fabricate pipe sizes up to 12 feet in diameter, and Metropolitan's construction forces have the necessary equipment and expertise to make the repairs in-house. In addition, Metropolitan has upgraded its satellite phones to ensure communication ability following a seismic event and is in the process of installing high frequency radios at all Incident Command Posts and the Emergency Operations Center.

Reporting

Metropolitan has committed to providing annual updates to its Board of Directors on its seismic resilience strategy and its progress toward identified short-term and long-term goals. Metropolitan has also committed to providing a formal report on a five-year interval summarizing accomplishments related to seismic resilience and changes in directives to the Seismic Resilience Strategy.

Inter-Agency Coordination

Improving the region's seismic resilience requires that member agencies understand the seismic risks to the imported water supplies so that they may appropriately plan on the local level. Opportunities for inter-agency coordination are provided through the Local Resources Program, where Metropolitan incentivizes the development of local groundwater, recycling, and other supply resources to offset imported demands. As stated previously, Metropolitan provides member agencies the opportunity to participate in emergency response exercises. As part of a recent study, Metropolitan developed maps that define the relative liquefaction susceptibility of the region inclusive of the conveyance and distribution system and has made these maps available to member agencies. Recently, Metropolitan updated the emergency storage goals through several workshops in coordination with member agencies.

Metropolitan is also a member of the Seismic Resilience Water Supply Task Force, along with the California Department of Water Resources (DWR) and the Los Angeles Department of Water and Power (LADWP). As the owners of the three conveyance facilities that provide imported water to the region, Metropolitan, DWR, and LADWP recognize the importance of coordinating responses following a major seismic event that disrupts the imported water supplies. Each agency has provided an overview of the seismic risk to their respective systems and are in the process of developing a Water Mutual Assistance Agreement to formalize the coordination efforts following a major earthquake that disrupts service to the imported water supplies.

Emergency Response Plans

Metropolitan also has two Emergency Response Plans: one dated March 2019 that has been in place long-term and is updated periodically; and a second dated September 2020, prepared pursuant to the requirements of the recently-enacted America's Water Infrastructure Act of 2018. The two plans work in conjunction. Together, Metropolitan's Emergency Response Plans present Metropolitan's organization and strategy for response to emergencies caused by natural hazards, malevolent acts, or other unavoidable circumstances. Metropolitan operates in accordance with the California Standardized Emergency Management System, the Incident Command System, and the National Incident Management System. The Emergency Response Plans provide guidelines for evaluating an emergency situation, responding to an emergency, and activating Incident Command Posts and the Emergency Operations Center. They also describe the Emergency Response Organization. Although the plans provide a framework for emergency response, they do not attempt to identify and discuss every potential situation or problem that may occur during an emergency. The plans will be exercised and updated regularly.

2.6 Other Supply Reliability Risks

Metropolitan provides water to a broad and heterogeneous service area with water supplies from a variety of sources and geographic regions. Each of these demand areas and supplies has its own unique set of benefits and challenges. Among the challenges Metropolitan's region faces are the following:

Supplies

- The Colorado River Basin experienced a severe 5-year drought from 2000-2004 with both precipitation and runoff significantly below average. Since that time, precipitation has been, on average, near normal while runoff has been less than average in two out of every three years. Overall, a potential change in the precipitation to runoff relationship may be resulting in conditions in which less runoff is generated from a given level of precipitation, pushing the system toward a drying trend that is often characterized as a long-term drought.
- Endangered species protection and conveyance needs in the Sacramento-San Joaquin River Delta System have resulted in operational constraints that are particularly important because pumping restrictions impact many water resources programs – SWP supplies and additional voluntary transfers, Central Valley storage and transfers, in-region groundwater storage, and in-region surface water storage.
- Changing climate patterns are predicted to shift precipitation patterns and possibly affect water supply.
- Difficulty and implications of environmental review, documentation, and permitting for multi-year transfer agreements, recycled water projects, and seawater desalination plants.
- Public perception of recycled water use.
- Opposition to local seawater desalination projects from environmental groups and community organizations. New regulations and permitting uncertainty are also barriers to seawater desalination supplies.

Operations and Water Quality

- The cost and use of energy and greenhouse gas emissions.
- Water quality regulations and issues, such as algae toxins, PFAS, and the identification of constituents of emerging concern, have a significant impact on the region's water supply conditions and underscore the importance of flexible and adaptive regional planning strategies.
- Salt and concentrate balance from a variety of sources.

Demand

- Fluctuations in population and economic growth.
- Uncertain location of growth.
- Uncertain housing stock and density.
- Changes in outdoor water use patterns.
- Potential COVID-19 impacts

The challenges posed by continued population growth, environmental constraints on the reliability of imported supplies, and new uncertainties imposed by climate change demand that Metropolitan assert the same level of leadership and commitment to taking on large-scale regional solutions to providing water supply reliability. New solutions are potentially available in the form of dramatically improved water-use efficiency, indirect and direct potable use of recycled water, and large-scale application of ocean desalinization.

Distribution System Water Losses

California Water Code Section 10631(d)(3) requires that urban retail suppliers quantify distribution system water loss for each of the five years preceding the plan update based on water system balance methodology developed by the American Water Works Association (AWWA). For the 2020 UWMP, Metropolitan is voluntarily reporting its treated distribution water loss. Metropolitan followed the AWWA Water Audit methodology to track all sources of water and uses of water within its system. The AWWA Water Audit methodology quantifies real and apparent water system losses in an agency's distribution system.

For its voluntary distribution system water losses assessment, Metropolitan included its water balance audit for the treated water portion of its system for calendar years 2015 through 2019. The results of Metropolitan's audit showed that the average total amount of treated distribution system water losses over the last five years from 2015 to 2019 is approximately 7.8 TAF. A detailed discussion of Metropolitan's treated distribution system water losses is included in Appendix 7 and summarized in Tables A.7-1 through A.7-5. In addition to the treated distribution system losses described in the AWWA tables, Metropolitan estimates that 41.6 TAF was lost from reservoir evaporation occurring in Lake Mathews, Lake Skinner, and DVL during calendar year 2019.

Climate Change

Climate change adds its own uncertainties to the challenges of planning. Metropolitan's water supply planning has been fortunate in having almost one hundred years of hydrological data regarding weather and water supply. This history of rainfall data has provided a sound foundation for forecasting both the frequency and the severity of future drought conditions, as well as the frequency and abundance of above-normal rainfall. But weather patterns can be expected to shift dramatically and unpredictably in a climate driven by increased concentrations of carbon dioxide in the atmosphere. These changes in weather significantly affect water supply planning, irrespective of the debate associated with the sources and cause of increasing concentrations of greenhouse gases. As a major steward of the region's water supply resources, Metropolitan is committed to performing its due diligence with respect to climate change.

Potential Impacts

While uncertainties remain regarding the exact timing, magnitude, and regional impacts of these temperature and precipitation changes, researchers have identified several areas of concern for California water planners. These include:

- Reduction in Sierra Nevada snowpack;
- Increased intensity and frequency of extreme weather events;
- Prolonged drought periods;
- Water quality issues associated with increase in wildfires;
- Changes in runoff pattern and amount; and
- Rising sea levels resulting in
    - Impacts to coastal groundwater basins due to seawater intrusion;
    - Increased risk of damage from storms, high-tide events, and the erosion of levees; and
    - Potential pumping cutbacks on the SWP and Central Valley Project (CVP)

Other important issues of concern due to global climate change include:

- Effects on local supplies such as groundwater;
- Changes in urban and agricultural demand levels and patterns;
- Increased evapotranspiration from higher temperatures;
- Impacts to human health from water-borne pathogens and water quality degradation;
- Declines in ecosystem health and function;
- Alterations to power generation and pumping regimes; and
- Increases in ocean algal blooms affected seawater desalination supplies.

Metropolitan's Activities Related to Climate Change Concerns

Resource Planning

Under the 2020 IRP, Metropolitan recognizes additional risks and uncertainties from a variety of sources:

- Water quality
- Climate change
- Regulatory and operational changes
- Project construction and implementation issues
- Infrastructure reliability and maintenance
- Demographic and growth uncertainty

Any of these risks and uncertainties, should they occur individually or collectively, may result in a negative impact to water supply reliability. While it is impossible to know how much risk and uncertainty to guard against, the region's reliability will be more secure with a long-term plan that recognizes risk and provides resource development to offset that risk.

Metropolitan has established an intensive, comprehensive technical process to identify key vulnerabilities to regional reliability. This Robust Decision Making (RDM) approach was used with both the 2015 and 2010 IRP Updates. The 2015 RDM approach utilized the Delta Method to examine climate change impacts to Metropolitans water supplies across its three basins. The Delta Method is a technique that downscales data from a suite of global climate models and creates climate perturbation factors, in this case temperature and precipitation changes, and applies them to Metropolitan's baseline Integrated Water Resources Plan Simulation Model (IRPSIM) assumptions. This methodology can show how vulnerable the region's reliability is to longer-term risks such as climate change and can also establish "signposts" that can be monitored to see when critical changes may be happening. For example, if observed climate data shows we are trending toward more severe change and the results of the RDM analysis show an unacceptable level of reliability in this future, Metropolitan can use this as a signpost to take action. Signposts include monitoring the direction of ever-changing impacts from improved Global Climate Models, and housing and population growth patterns.

The RDM analysis was not only valuable in identifying vulnerabilities to Metropolitan's 2015 IRP approach to long-term reliability, it was also pivotal in understanding how climate change would best be incorporated into the 2020 IRP and IRPSIM modeling. On the Colorado River Aqueduct, the RDM analysis helped determine that the most appropriate way to look at climate change impacts would be to alter the inflow hydrologies within the CRSS model, which would then serve as inputs to Metropolitan's IRPSIM model. On the SWP side, climate change impacts were included by altering SWP water deliveries provided in the 2019 Delivery Capability report and derived by CalSim 2. Metropolitan assembled a panel of climate change experts to translate how specific climate change impacts, such as changes to runoff timing, would be quantified and to what degree in the IRP scenario approach.

Knowledge Sharing and Research Support

Metropolitan is an active and founding member of the Water Utility Climate Alliance (WUCA). WUCA consists of twelve nationwide water providers collaborating on climate change adaptation. As a part of this effort, WUCA pursues a variety of activities on multiple fronts.

Member agencies of WUCA annually share individual agency actions on climate change adaptation and greenhouse gas mitigation strategies and collaborate on projects aimed at advancing adaptation in the water sector. WUCA also monitors development of climate change-related research, technology, programs, and federal legislation.

In addition to supporting federal and regional efforts, WUCA has released numerous white papers and reports. In 2019, WUCA co-produced with the Water Research Foundation the report "Mapping Climate Exposure and Climate Information Needs to Water Utility Business Functions." The purpose of this paper was to develop a comprehensive, enterprise-level framework for understanding the exposure and sensitivities of water utility business functions to a changing climate and for accelerating the mainstreaming of climate considerations into utility management.

In 2016, WUCA published "Co-producing Actionable Science for Water Utilities." The paper explores the efforts of four water utilities to co-produce actionable science by forging partnerships with scientific institutions to explore integrating climate considerations into their specific management context. The experiences of these four utilities and their scientific partners, as part of the Piloting Utility Modeling Applications project of the Water Utility Climate Alliance, provide a wealth of empirical evidence to illustrate some of the core concepts formulated to explain how to produce usable information and how to link research to decision making.

In recent years, WUCA has created a training that rotates around the country and aims to build a community of smart consumers of climate information proactively pursuing climate adaptation in the water sector. The training sessions include learning different methods for incorporating climate change information into water resource planning, guiding principles for resilience planning, communication strategies, tactics for decision making under conditions of uncertainty, and more.

WUCA continues to pursue opportunities and partnerships with water providers, climate scientists, federal agencies, research centers, academia and key stakeholders. Metropolitan also continues to pursue knowledge sharing and research support activities outside of WUCA. Metropolitan regularly provides input and direction on California legislation related to climate change issues. Metropolitan is active in collaborating with other state and federal agencies, as well as non-governmental organizations, on climate change related planning issues. The following list provides a sampling of entities that Metropolitan has recently worked with on a collaborative basis:

- RAND Corporation
- USBR
- U.S. Army Corps of Engineers
- AWWA Research Foundation

- National Center for Atmospheric Research
- California Energy Commission
- California Department of Water Resources

Quantification of Current Research

Metropolitan continues to incorporate current climate change science into its planning efforts. A major component of the current IRP effort is to explicitly reflect uncertainty in Metropolitan's future water management environment. This involves evaluating a wider range of water management strategies and seeking robust and adaptive plans that respond to uncertain conditions as they evolve over time, and that ultimately will perform adequately under a wide range of future conditions. The potential impacts and risks associated with climate change, as well as other major uncertainties and vulnerabilities, have been incorporated into the current IRP process. Overall, Metropolitan's planning activities strive to support the Board adopted policy principles on climate change by:

- Supporting reasonable, economically viable, and technologically feasible management strategies for reducing impacts on water supply,
- Supporting flexible "no regret" solutions that provide water supply and quality benefits while increasing the ability to manage future climate change impacts, and
- Evaluating staff recommendations regarding climate change and water resources under the California Environmental Quality Act (CEQA) to avoid adverse effects on the environment.

Implementation of Programs and Policies

Metropolitan has made great efforts to implement greenhouse gas mitigation programs and policies for its facilities and operations. Similar to Metropolitan's approach to managing water resources, effectively reducing greenhouse gas emissions requires a portfolio approach that looks at all sources and implements strategies to reduce emissions over time. To date, these programs and policies have focused on:

- Developing Metropolitan's Climate Action Plan, which sets the target and guides future actions to reduce emission levels, pursuant to CEQA guidelines, and complements Metropolitan's IRP;
- Developing Metropolitan's Energy Sustainability Plan, which identifies ways to contain energy costs, move toward energy independence, and reduce price volatility through cost-effective alternative energy projects;
- Exploring water supply/energy relationships and opportunities to increase efficiencies;
- Participating in The Climate Registry, a nonprofit greenhouse gas emissions registry for North America that provides organizations with the tools and resources to help them calculate, verify, report, and manage their greenhouse gas emissions in a publicly transparent and credible way;
- Acquiring "green" fleet vehicles, and supporting an employee Rideshare program;
- Designing retail battery energy storage systems at the Weymouth, Skinner, and Jensen treatment plants, as well as the OC-88 (Orange County) pump station;
- Developing solar power at the Skinner water treatment plant, the Weymouth water treatment plant, the Jensen water treatment plant, and the Diamond Valley Lake Visitor Center; and

- Identifying and pursuing development of “green” renewable water and energy programs that support the efficient and sustainable use of water.

Metropolitan also continues to be a leader in efforts to increase regional water use efficiency. Metropolitan has worked to increase the availability of incentives for local conservation and recycling projects, as well as supporting conservation Best Management Practices for industry and commercial businesses. Many of Metropolitan’s water use efficiency incentives also reduce customer electricity and natural gas use. In recognition of this fact, Metropolitan has MOUs with regional energy utilities to jointly implement water use efficiency programs that save energy and reduce greenhouse gas emissions.

2.7 Pricing and Rate Structures

Revenue Sources and Management

A high proportion of Metropolitan's revenues come from volumetric water rates. Water sales revenues are approximately 80 percent of Metropolitan's total revenues. As a result, Metropolitan's revenues vary according to regional weather, the availability of statewide water supplies, the availability of local supplies to its member agencies, the economy, and other factors. For example, in dry years, local demands tend to increase, and Metropolitan may receive higher than anticipated revenues due to increased sales volumes. In contrast, in wet years, demands tend to decrease, and revenues drop due to lower sales volumes. In addition, statewide supply shortages such as those in 2009 and 2015 also affect Metropolitan's revenues. Such revenue surpluses and shortages could cause instability in water rates. To mitigate this risk, Metropolitan maintains financial reserves, with a minimum and target balance, to help stabilize water rates during times of reduced water sales. The reserves hold revenues collected during times of high water sales and are used to offset the need for revenues during times of low sales.

Another way in which Metropolitan helps to mitigate rate volatility is by generating a portion of revenues from fixed sources. Metropolitan currently has two fixed charges: the Readiness-to-Serve Charge (RTS) and the Capacity Charge. Metropolitan also collects tax revenue from taxable property within its boundaries. The revenues from fixed charges generate approximately 18 percent of all Metropolitan revenues. RTS revenues have been decreasing gradually, from $155.5 million in fiscal year 2015-16, to $135 million in fiscal year 2021-22.

Finally, Metropolitan generates revenue from interest income, hydroelectric power sales, and miscellaneous income such as rents and leases. For the last five fiscal years, these averaged approximately three percent of all Metropolitan revenues. These internally generated revenues are referred to as revenue offsets and reduce the amount of revenue that needs to be collected from rates and charges.

Elements of Rate Structure

This section provides an overview of Metropolitan's rate structure. The different elements of the rate structure are discussed below and summarized in Table 2-9.

System Access Rate (SAR)

The SAR recovers the costs of Conveyance, Distribution, and Storage that is used on an average annual basis through a uniform, volumetric rate. All member agencies pay the SAR for access to conveyance and distribution capacity in the Metropolitan system.

Water Stewardship Rate (WSR)

The WSR provides a dedicated source of funding for Metropolitan's demand management function through a uniform, volumetric rate recovered through the end of calendar year 2020. Metropolitan's demand management operations functions include past and future conservation and local resources projects. Because of the uniform benefits conferred on all system users by investments in conservation and local resources, all users of Metropolitan's conveyance and distribution system paid the WSR except for exchange deliveries to SDCWA in calendar years 2018 through 2020.

Metropolitan's Board suspended the billing and collection of the WSR for calendar years 2018, 2019, and 2020 on exchange deliveries to SDCWA pending Metropolitan's completion of a cost allocation study of its demand management costs. Having completed the demand management cost allocation process, in December 2019 Metropolitan's Board directed staff: (1) to incorporate the use of the 2019/20 fiscal-year-end balance of the Water Stewardship Fund to fund all demand management costs in the proposed FY 2020/21 and 2021/22 biennial budget; and (2) to not incorporate the WSR, or any other rates or charges to recover demand management costs, with the proposed rates and charges for CYs 2021 and 2022. As a result, the WSR is not collected from any member agency as of January 1, 2021. This decision provided the Board additional time to consider a rate design alternative for recovery of future demand management costs.

Therefore, as a result of this Board decision, the WSR is not incorporated in the rate structure during calendar years 2021 and 2022.

System Power Rate (SPR)

The SPR recovers the costs of energy required to pump water to Southern California through the SWP and CRA. The cost of power is recovered through a uniform, volumetric rate.

Treatment Surcharge

The Treatment Surcharge recovers all of the costs of providing treatment capacity and operations through a uniform, volumetric rate per acre-foot of treated water transactions.

Capacity Charge

The Capacity Charge recovers the costs incurred to provide peak capacity within the Distribution System. The Capacity Charge also provides a price signal to encourage agencies to reduce peak demands on the Distribution System and to shift demands that occur during the May 1 through September 30 period into the October 1 through April 30 period, resulting in more efficient utilization of Metropolitan's existing infrastructure and deferring capacity expansion costs.

Readiness-To-Serve Charge (RTS)

The RTS recovers the cost of the portion of system that is available to provide emergency service and available capacity during outages and hydrologic variability.

The RTS is a fixed charge that is allocated among the member agencies based on a ten-fiscal-year rolling average of firm demands. Water transfers and exchanges are included for purposes of calculating the ten-year rolling average. The Standby Charge is collected at the request of some member agencies that have elected to use the charge as a direct offset to the member agency's RTS obligation.

Tier 1 Supply Rate

The Tier 1 Supply Rate is a volumetric rate charged on Metropolitan's water sales that are within a member agency's Tier 1 maximum. The Tier 1 Supply Rate supports a regional integrated approach through the uniform, postage stamp rate. The Tier 1 Supply Rate is calculated as the amount of the total revenue requirement functionalized as supply divided by the estimated amount of Tier 1 water sales.

Tier 2 Supply Rate

The Tier 2 Supply Rate is a volumetric rate that reflects Metropolitan's cost of purchasing water transfers north of the Delta. The Tier 2 Supply Rate is charged on Metropolitan water sales that exceed a member agency's Tier 1 maximum. The Tier 2 Supply Rate encourages the member agencies and their customers to maintain existing local supplies and develop cost-effective local supply resources and conservation.

Table 2-9
Rate Structure Components

Rate Design Elements	Service Provided/ Costs Recovered	Type of Charge
System Access Rate	Conveyance/Distribution/Storage (Average Capacity)	Volumetric ($/AF)
System Power Rate	Power	Volumetric ($/AF)
Treatment Surcharge	Treatment	Volumetric ($/AF)
Capacity Charge	Peak Distribution System Capacity	Fixed ($/cfs)
Readiness-To-Serve Charge	Available capacity for Conveyance/Distribution and Emergency Storage	Fixed ($Million)
Tier 1 Supply Rate	Supply	Volumetric ($/AF)
Tier 2 Supply Rate	Reflects cost of water transfers from North of the Delta	Volumetric ($/AF)

The following tables provide further information regarding Metropolitan's rates. Table 2-10 summarizes the rates and charges effective January 1, 2020, January 1, 2021, and January 1, 2022. Average costs of Metropolitan's service by member agency will vary depending upon an agency's RTS allocation, Capacity Charge, and relative proportions of treated and untreated Tier 1, and Tier 2 water purchases. Table 2-11 provides the details of the Capacity Charge, calculated for calendar year 2021.

Table 2-12 provides the details of the RTS calculation for calendar year 2021 by member agency. Table 2-13 provides the current Purchase Order commitment quantities that member agencies will purchase from Metropolitan over the 10-year period starting January 2015 through December 2024. Tier 1 annual average limits for each member agency are also shown in this table.

Table 2-10
Metropolitan Water Rates and Charges

Effective	Jan 1, 2020	Jan 1, 2021	Jan 1, 2022
Tier 1 Supply Rate ($/AF)	$208	$243	$243
Tier 2 Supply Rate ($/AF)	$295	$285	$285
System Access Rate ($/AF)	$346	$373	$389
Water Stewardship Rate ($/AF)	$65	-	-
System Power Rate ($/AF)	$136	$161	$167
Full Service Untreated Volumetric Cost ($/AF)			
Tier 1	$755	$777	$799
Tier 2	$842	$819	$841
Treatment Surcharge ($/AF)	$323	$327	$344
Full Service Treated Volumetric Cost ($/AF)			
Tier 1	$1,078	$1,104	$1,143
Tier 2	$1,165	$1,146	$1,185
Readiness-to-Serve Charge ($M)	$136	$130	$140
Capacity Charge ($/cfs)	$8,800	$10,700	$12,200

Table 2-11
Capacity Charge Detail Calendar Year 2021

	Peak Day Demand (cfs) (May 1 through September 30) Calendar Year				
Agency	**2017**	**2018**	**2019**	**3-Year Peak**	**Calendar Year 2021 Capacity Charge ($10,7000/cfs)**

Implementing the Plan 3

This section summarizes Metropolitan's implementation plans and continued progress in developing a diversified resource mix that enables the region to meet its water demands under a wide range of possible future conditions. The investments that Metropolitan has made and its ongoing efforts in many different areas coalesce toward its goal of long-term regional water supply reliability. Many of the resource programs discussed are already successfully implemented. Others will take more time to execute. Considerations are also in place for emerging integrated supplies, which could augment sources of regional water supply from non-traditional sources. In addition, water demand reductions brought about by legislative mandates could affect the landscape of future supply planning and implementation. The following sections discuss each of these programs, presenting both successes to date and the programs that are still underway.

Metropolitan's IRP implementation approach is consistent with the California Water Resilience Portfolio that was released in July 2020. The California Water Resilience Portfolio is discussed briefly below.

California Water Resilience Portfolio

On April 29, 2019, Governor Newsom issued Executive Order N-10-19 that directed the California Natural Resources Agency, the California Environmental Protection Agency, and the California Department of Food and Agriculture to prepare a water resilience portfolio that meets the needs of California's communities, economy and environment through the 21st century.

The agencies were directed to first inventory and assess:

a. Existing demand for water on a statewide and regional basis and available water supply to address this demand.

b. Existing water quality of aquifers, rivers, lakes and beaches.

c. Projected water needs in the coming decades for communities, economy and environment.

d. Anticipated impacts of climate change to our water systems including growing drought and flood risks, and other challenges to water supply reliability.

e. Work underway to complete voluntary agreements for the Sacramento and San Joaquin river system regarding flows and habitat.

f. Current planning to modernize conveyance through the Bay Delta with a new single tunnel project.

g. Expansion of the state's drinking water program to ensure all communities have access to clean, safe and affordable drinking water.

h. Existing water policies, programs and investments within state government.

The California Water Resilience Portfolio outlines goals and actions to help address the state's water challenges through a broad and diversified approach. The goals and actions are meant to be achieved region by region based on the unique challenges and opportunities in each area and are organized into four categories:

1. Maintain and diversify water supplies – the state will continue to help regions reduce reliance on any one source of water supply and diversify water supplies to enable flexibility in the face of changing conditions.
2. Protect and enhance natural ecosystems – the state will provide leadership in restoring the environmental health of our river systems through effective standard setting, continued investments and more adaptive and holistic environmental management.
3. Build connections – the state aims to improve infrastructure to store, move and share water more effectively, and to integrate water management through shared use of science, data and technology.
4. Be prepared – the state will provide guidance to support preparation, protective actions and adaptive management of regions in the face of new threats and stresses due to climate change.

3.1 Colorado River

Metropolitan's goal for the Colorado River is to maintain current supplies and programs, while also maintaining flexibility through dry-year programs and storage. This goal involves protecting existing supply and storage programs in the face of risks that could impact Colorado River supplies in the future.

Background

Metropolitan was established to obtain an allotment of Colorado River water, and its first mission was to construct and operate the Colorado River Aqueduct (CRA). Under its contracts with the federal government, Metropolitan has a basic fourth priority entitlement of 550 TAF per year of Colorado River water. Metropolitan also holds a fifth priority for an additional 662 TAF per year that exceeds California's 4.4 MAF per year basic apportionment, and another 180 TAF per year when surplus flows are available. Metropolitan can obtain water under the fifth priority from:

- Water unused by the California holders of priorities 1 through 3
- Water saved by the Palo Verde land management, crop rotation, and water supply program, or
- When the U.S. Secretary of the Interior makes available either or both:
    - Surplus water, and
    - Water apportioned to, but unused by, Arizona and/or Nevada.

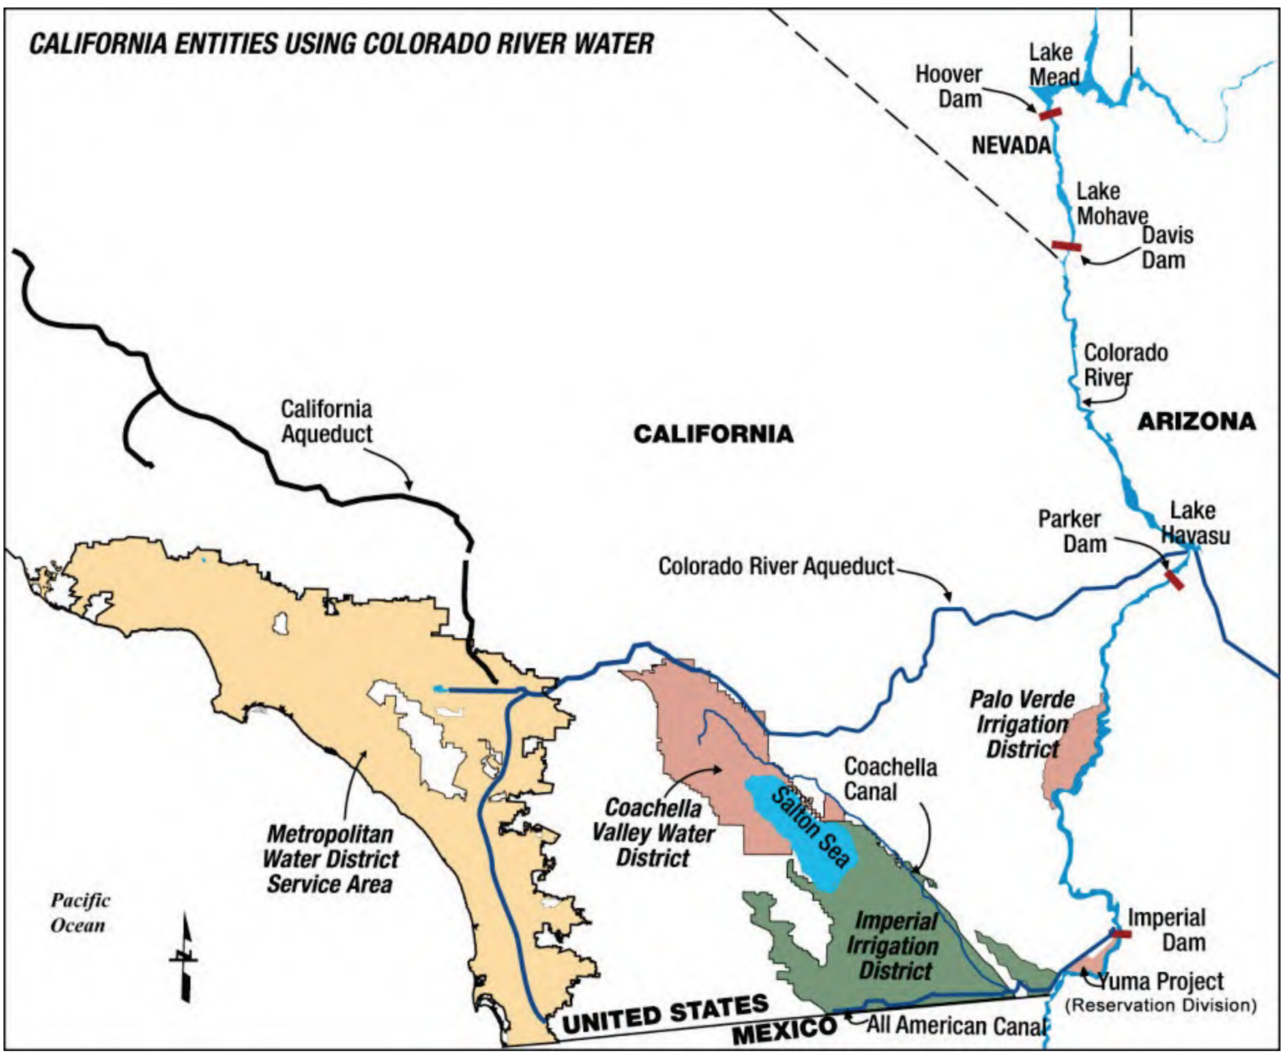
To satisfy a condition imposed by Congress in the Boulder Canyon Project Act, California's legislature enacted the Limitation Act in 1929, agreeing to limit consumptive use of Colorado River water to 4.4 MAF per year, plus not more than one-half of any excess or surplus waters unapportioned by the Colorado River Compact. The 1931 Seven Party Agreement provides the basis for the priorities among California contractors' use of Colorado River water available to California. Palo Verde Irrigation District (PVID), the Yuma Project (Reservation Division), Imperial Irrigation District (IID), and Coachella Valley Water District (CVWD), collectively the "agricultural entities," and Metropolitan are the entities that currently hold the priorities. These priorities are included in the contracts that the Department of the Interior executed with the California agencies in the 1930s for delivery of water from Lake Mead. The first four priorities total 4.4 MAF per year. As noted above, Metropolitan has the fourth priority of 550 TAF to California's basic apportionment and the fifth priority to 662 TAF per year. Under priorities 1 through 3, an amount not to exceed 3.85 MAF was apportioned to the agricultural entities for beneficial consumptive use. The Seven Party Agreement did not specify individual quantities for each of the first three priorities; rather, the amount of water available under the third priority was limited to the amount unused by the holders of priorities 1 and 2 on designated areas of land. This lack of quantification among the agricultural priorities posed an obstacle to the acquisition of water from the agricultural entities for use in Metropolitan's service area.

The Consolidated Decree issued in 2006 by the U.S. Supreme Court in *Arizona v. California*, consolidated into one decree the initial 1964 decree, the 1979 supplemental decree, the 1984 second supplemental decree, the 2000 third supplemental decree, and the 2006 approval settlements reached on the water rights claim of the Fort Yuma Indian Reservation. The Consolidated Decree confirmed the normal year allocation of 4.4 MAF per year to California. This limit effectively reduced Metropolitan's dependable supply of Colorado River water to its fourth priority amount of 550 TAF per year. The Consolidated Decree quantified present perfected rights (PPRs) to the use of Colorado River water by certain Indian reservations, federal wildlife refuges, and other users. Within California some, but not all, of these PPRs are encompassed by the Seven Party Agreement. Consumptive use under these non-encompassed PPRs, known as "Miscellaneous and Indian PPRs," could reach as much as 61 TAF annually. Since 1985, these PPR holders have used less than 20 TAF annually. Because over 5.362 MAF of Colorado River water were already allocated by California's Seven Party Agreement, it was not clear which rights would be affected by the use of these non-encompassed PPRs.

For a period following the Court's 1964 decree, Metropolitan's fifth priority rights were satisfied with water unused under California's first three agricultural priorities and water allocated to, but unused by, Arizona and Nevada. With the commencement of Colorado River water deliveries to the Central Arizona Project in 1985, the availability of Colorado River water to meet Metropolitan's needs was determined on a year-by-year basis. Through 2002, Metropolitan's diversion requests were fully satisfied with unused supplies and surplus waters.

Figure 3-1 shows the major aqueducts within southern California including those from the Colorado River, and entities within the state having rights to use water from the Colorado River.

Figure 3-1



Changed Conditions

California's Colorado River Water Use Plan and the Quantification Settlement Agreement

Metropolitan and the State of California acknowledged that Metropolitan would obtain less water from the Colorado River in the future than Metropolitan had in the past, but the lack of clearly quantified water rights hindered efforts to promote water management projects. The Secretary of the Interior asserted that California's users of Colorado River water had to limit their use to a total of 4.4 MAF per year, plus any available surplus water. Under the auspices of the state's Colorado River Board, these users developed a draft plan to resolve the problem, which was known as "California's Colorado River Water Use Plan" or the "California Plan." It characterized how California would develop a combination of programs to allow the state to limit its annual use of Colorado River water to 4.4 MAF per year plus any available surplus water. The 2003 Quantification Settlement Agreement (QSA) among IID, CVWD, and Metropolitan is a critical component of the California Plan. It establishes the baseline water use for each of the agencies, facilitates the transfer of water from agricultural agencies to urban uses, and specifies that IID, CVWD, and Metropolitan would forbear use of water to permit the Secretary of the Interior to satisfy the uses of the PPRs not covered by the Seven Party Agreement.

On November 5, 2003, IID filed a validation action in Imperial County Superior Court, seeking a judicial determination that thirteen agreements associated with the QSA are valid, legal, and binding. Other lawsuits also were filed challenging the execution, approval, and subsequent implementation of the QSA on various grounds. All of the QSA cases were coordinated in Sacramento County Superior Court. After more than a decade of litigation, the final challenges to the QSA were dismissed, and the agreements were upheld.

San Diego County Water Authority (SDCWA) is participating in three QSA-related projects that are providing additional water supplies that the agency exchanges with Metropolitan for receipt of Metropolitan deliveries.[1] First, the water conserved by these projects is made available to Metropolitan. In exchange, Metropolitan is delivering an amount of Metropolitan water equal to the amount of Colorado River water conserved by IID for SDCWA. Second, federal law allocates a portion of the water available as a result of the Coachella Canal Lining Project and the All-American Canal Lining Project for the benefit of parties, including five Indian Bands, and two non-Indian municipal water purveyors (San Luis Rey Settlement Parties) involved in litigation over water rights to the San Luis Rey River in San Diego County. Metropolitan has agreed to exchange that water and provide an equal amount of water to the United States for use by the San Luis Rey Settlement Parties, and SDCWA has agreed to convey the water when capacity is available for use within the Settlement Parties' service areas. The remainder of the water available as a result of the canal lining projects, up to the cap specified in the Metropolitan-SDCWA exchange agreement, is exchanged with SDCWA.

In 2005, Metropolitan entered into a settlement agreement in Arizona v. California with the Quechan Indian Tribe and other parties. The Tribe uses Colorado River water on the Fort Yuma Indian Reservation. Under the settlement agreement, the Tribe, in addition to the amounts of water decreed for the benefit of the Reservation in the 1964 decree in Arizona v. California, is entitled to (a) 20 TAF of diversions from the Colorado River, or (b) the amount necessary to supply the consumptive use required for irrigation of a specified number of acres, and for the satisfaction of related uses, whichever is less. Of the additional diversions, 13 TAF became available to the Tribe in 2006. An additional 7 TAF becomes available to the Tribe in 2035. Metropolitan agreed

---

[1] These projects, the SDCWA/IID transfer and the Coachella and All-American canal lining projects, will be discussed in SDCWA's Urban Water Management Plan.

to provide annual incentive payments to the Tribe if the Tribe forbore diversion of the additional water, thereby allowing Metropolitan to divert it.

Current Dry Condition

The Colorado River Basin experienced a severe 5-year drought from 2000 to 2004 with both precipitation and runoff significantly below average. Since that time precipitation has been, on average, near normal, while runoff has been less than average in two out of every three years. Overall, a potential change in the precipitation to runoff relationship may be resulting in conditions in which less runoff is generated from a given level of precipitation, pushing the system toward a drying trend that is often characterized as a long-term drought. For example, in 2020, the Upper Colorado River Basin snowpack peaked in April at 107 percent of median. However, April through July runoff was observed at just 52 percent of average due to hot and dry conditions in the late spring and early summer. The overall 21-year drying trend has resulted in Lake Mead and Lake Powell storage at 40 and 42 percent of capacity, respectively, leaving less of a buffer for a future period of reduced precipitation.

Quagga Mussels

Quagga mussels were discovered in January of 2007 in Lake Mead and rapidly spread downstream to the Lower Colorado River. The presence and spawning of quagga mussels in the Lower Colorado River and in reservoirs located in southern California pose an immediate threat to water and power systems serving more than 25 million people in the southwestern United States. Quagga mussels (*Dreissena bugensis*) are a related species to the better-known zebra mussels (*Dreissena polymorpha*) and are indigenous to Ukraine. They were introduced to the Great Lakes in the 1980s from fresh-water ballast of a transoceanic ship traveling from Eastern Europe. Although the introduction of these two species into drinking water supplies does not typically result in violation of drinking water standards, invasive mussel infestations can adversely impact aquatic environments and infrastructure. If unmanaged, invasive mussel infestations have been known to severely impact the aquatic ecology of lakes and rivers; clog intakes and raw water conveyance systems; reduce the recreational and aesthetic value of lakes and beaches; alter or destroy fish habitats; and render lakes more susceptible to deleterious algae blooms.

Implementation Approach

Metropolitan's planning strategy recognized explicitly that program development would play an important part in reaching the target level of deliveries from the Colorado River. The implementation approach explored a number of water conservation programs with water agencies that receive water from the Colorado River or are located in proximity to the CRA. Negotiating the QSA was a necessary first step for all of these programs. On October 10, 2003, after lengthy negotiations, representatives from Metropolitan, IID, and CVWD executed the QSA and other related agreements. Parties involved also included SDCWA, the California Department of Water Resources (DWR), the California DFW, the U.S. Department of the Interior, and the San Luis Rey Settlement Parties. One of those related agreements was the Colorado River Water Delivery Agreement: Federal Quantification Settlement Agreement, which specifies to which agencies water will be delivered under priorities 3a and 6a of the Seven Party Agreement during its term.

Metropolitan has identified several programs that could be used to achieve the regional long-term development targets for the Colorado River, as shown in Table 3-1. Metropolitan has entered into or is exploring agreements with agencies as described in this section. In addition,

Appendix 3 provides a detailed discussion of these programs and describes whether the programs are being implemented, are deferred, or are under investigation.

Colorado River Water Management Programs

Imperial Irrigation District/Metropolitan Water District Conservation Program

Under agreements executed in 1988 and 1989, Metropolitan has funded water efficiency improvements within IID's service area in return for the right to divert the water conserved by those investments. Under this program, IID implemented a number of structural and non-structural measures, including the lining of existing earthen canals with concrete, constructing local reservoirs and spill-interceptor canals, installing non-leak gates, and automating the distribution system. Other implemented programs include the delivery of water to farmers on a 12-hour rather than a 24-hour basis and improvements in on-farm water management through irrigation management improvements. Through this program, IID has conserved an additional 105 TAF per year on average upon completion of program implementation. Execution of the QSA and amendments to the 1988 and 1989 agreements resulted in changes in the availability of water under the program, extending the term to 2078 if the term of the QSA extends through 2077, which guaranteed Metropolitan at least 85 TAF per year with the remainder of the conserved water available to CVWD when needed. In a 2019 agreement, Metropolitan and CVWD agreed to increase the amount of water guaranteed to Metropolitan to 90 TAF per year from 2020 to 2026, with the remainder of the conserved water available for Metropolitan's delivery to CVWD at Whitewater.

Palo Verde Land Management, Crop Rotation, and Water Supply Program

In May 2004, Metropolitan's Board authorized a 35-year land management, crop rotation, and water supply program with PVID. Under the program, participating farmers in PVID are paid to reduce their water use by not irrigating a portion of their land. A maximum of 29 percent of the lands within the Palo Verde Valley can be fallowed in any given year. Under the terms of the QSA, water savings within the PVID service area are made available to Metropolitan. This program provides up to 133 TAF of water to be available to Metropolitan in certain years. Over the life of the program, an average of 84.5 TAF per year has been saved and made available to Metropolitan. Additionally, in March 2009, Metropolitan and PVID entered into a one-year supplemental fallowing program within PVID that provided for the fallowing of additional acreage, with savings of 24.1 TAF in 2009 and 32.3 TAF in 2010.

Bard Seasonal Fallowing Program

In December 2019, Metropolitan's Board authorized a seven-year seasonal fallowing program with the Bard Water District. Under the program, participating farmers in Bard are paid to reduce their water use by not irrigating their land between the late spring and summer months. A maximum of 3,000 acres will be fallowed in the Bard Unit. Estimated water savings are between 1.5 and 2.0 AF per irrigable acre. Bard is part of the Yuma Project Reservation Division. Bard therefore holds a higher priority than Metropolitan, and any reductions in their water consumption increases supplies available to Metropolitan. Metropolitan has the option to make a fallowing call every year. The fallowing call notifies Bard and the farmers if Metropolitan needs fallowing the following year. This program provides up to 6 TAF of water to be available to Metropolitan in certain years.

Management of Metropolitan-Owned Land in Palo Verde

In 2001, Metropolitan acquired 8,946 acres of irrigable farmland within the Palo Verde Irrigation District (PVID). These lands were leased to growers and were eventually enrolled in the PVID Land

Management, Crop Rotation and Water Supply Program when it began in 2005. In 2015, Metropolitan acquired an additional 12,049 irrigable acres from Verbena LLC, bringing Metropolitan's ownership in the Palo Verde Valley to approximately 20,995 acres of irrigated farmland. The lands have historically been leased to growers who produced high water-using crops such as alfalfa.

In 2017 and 2018, Metropolitan entered into new leases on the lands with the goal of reducing consumptive water use while maintaining the lands as productive farmland. Strategies for reducing water use include incentivizing lessees to grow lower water-using crops, experimenting with different crop rotation cycles, and studying alternative irrigation practices. To assist in these studies, Metropolitan has deployed technologies for measuring crop water use via remote sensing imagery and ground-based sensors.

If long-term water savings from these farm leases is realized, Metropolitan may explore ways to have them formally accounted for in Metropolitan's Colorado River supplies in the future.

<u>Southern Nevada Water Authority and Metropolitan Storage and Interstate Release Agreement</u>

SNWA has undertaken extraordinary water conservation measures to maintain its consumptive use within Nevada's basic apportionment of 300 TAF. The success of the conservation program has resulted in unused basic apportionment for Nevada. As SNWA expressed interest in storing a portion of the water with Metropolitan, the agencies, along with the United States and the Colorado River Commission of Nevada, entered into a storage and interstate release agreement in October 2004. Under the agreement, additional Colorado River water supplies are made available to Metropolitan when there is space available in the CRA to receive the water. SNWA stored approximately 422 TAF with Metropolitan through 2019, 330 TAF of which is available for return to SNWA. In addition to providing capacity for SNWA to store unused water, the program has been beneficial to Metropolitan, providing additional water during dry years, especially during the recent California drought (2011 to 2016). SNWA is not expected to call upon Metropolitan to return water until after 2026.

<u>Lower Colorado Water Supply Project</u>

The Lower Colorado Water Supply Project was authorized by Congress in the 1980s to provide up to 10 TAF of water per year to the City of Needles and other entities adjacent to the river in California that do not have rights or have insufficient rights to use Colorado River water. In March 2007, Metropolitan, the City of Needles, and the United States Bureau of Reclamation (USBR) executed a Lower Colorado Water Supply Project contract. Under the contract, Metropolitan receives, on an annual basis, project water left unused by the project contractors along the River. The water supply for the project comes from groundwater wells located along the All-American Canal. A portion of the payments made by Metropolitan to the City of Needles is placed in a trust fund for potentially acquiring a new water supply for the project should the groundwater pumped from the project's wells become too saline for use. Metropolitan received 9.5 TAF from this project in 2019 and will receive an estimated 8.8 TAF in 2020 based on the amount of water pumped and used by other project water users.

<u>Exchange with SDCWA</u>

SDCWA has acquired conserved Colorado River water reaching an annual volume of 277.7 TAF by 2023. SDCWA makes this water available at Lake Havasu for Metropolitan diversion, where Metropolitan takes possession of the water and provides a matching volume from Metropolitan's blended supplies to SDCWA by exchange in equal monthly amounts. The conserved water is acquired by SDCWA through its transfer agreement with the Imperial Irrigation District (IID) and from the lining of the All-American and Coachella canals.

Under the transfer agreement with IID, 192.5 TAF was transferred and exchanged with Metropolitan in 2020. In 2021, the transfer reaches 205 TAF, reduces to 202.5 TAF in 2022, then stabilizes at 200 TAF per year in 2023. The water is being conserved through on-farm efficiency conservation arrangements made by IID with its customers and other system efficiency measures.

The Coachella Canal Lining Project consists of a 35-mile concrete-lined canal, including siphons, which replaced an earthen canal. The project was completed in December 2006 and conserves 30,850 AF annually. The All-American Canal Lining Project consists of a concrete-lined canal constructed parallel to 23 miles of earthen canal. The project was completed in 2009 and conserves 67,700 AF annually.

Pursuant to the QSA and related agreements, the 98,550 AF of water resulting from these projects annually is allocated as follows: 16,000 AF to the San Luis Rey Settlement Parties in San Diego County, 77,700 AF to SDCWA, and 4,850 AF for Coachella Canal Lining Project mitigation. Any portion of the latter volume not used for mitigation is allocated to SDCWA; however, whether SDCWA can actually receive such water is subject to other laws, agreements, and factors.

The combined volume IID transferred water and canal lining water that Metropolitan will exchange with SDCWA is limited to 282.7 TAF in 2021, 280.2 TAF in 2022, and 277.7 TAF each year thereafter.

Exchange with the United States

Of the 16,000 AF allocated to the San Luis Rey Settlement Parties from the water conserved from the All-American Canal Lining Project and Coachella Canal Lining Project, the United States furnishes this water at Metropolitan's Colorado River Intake on Lake Havasu. Metropolitan takes possession of the water and by exchange delivers an equal volume of Metropolitan's blended supplies to SDCWA. By separate agreement, SDCWA conveys the water to the San Luis Rey Settlement Parties.

Lake Mead Storage Program

In May 2006, Metropolitan and the USBR executed an agreement for a demonstration program that allowed Metropolitan to leave conserved water in Lake Mead, for exclusive use by Metropolitan in later years, that Metropolitan would otherwise have used in 2006 and 2007. The program required that such water left in Lake Mead must be through reduced use resulting from implementation of extraordinary conservation measures and not simply be water that was not needed by Metropolitan in the year it was stored. This extraordinary conservation was accomplished through savings realized under the Palo Verde Land Management, Crop Rotation, and Water Supply Program. Through the two-year demonstration program, Metropolitan created 44.8 TAF of "Intentionally Created Surplus" (ICS) water.

In December 2007, Metropolitan entered into agreements to set forth the rules under which ICS water is developed, stored in, and delivered from Lake Mead. According to these rules, the amount of water stored in Lake Mead, created through extraordinary conservation, that is available for delivery in a subsequent year was reduced by a one-time deduction of five percent, resulting in additional system water in storage in the lake, and an annual evaporation loss of three percent, beginning in the year following the year the water is stored. The 2019 Lower Basin Drought Contingency Plan (Lower Basin DCP; see below) changed these rules such that, for ICS creators party to the DCP (including Metropolitan), a one-time10 percent deduction is assessed on ICS in the year it is created, without additional future evaporation losses. Metropolitan created ICS water in 2009, 2010, 2011, 2012, 2016, 2017, 2018, and 2019 and withdrew ICS water in 2008, 2013, 2014, and 2015. As of January 1, 2020, Metropolitan had a total of 866 TAF of Extraordinary Conservation ICS water in Lake Mead.

Under these agreements, Metropolitan also agreed to store excess conservation by IID, up to 25 TAF per year with a cumulative cap of 50 TAF, with return upon the request of IID, subject to the conditions of the agreement. This was later amended in 2015 to temporarily increase the amount of excess conservation that Metropolitan would store, to account for the success of IID's conservation programs and the extreme drought conditions within the State of California. Metropolitan stored water for IID in 2014, 2015, 2016, and 2017. As of January 1, 2020, Metropolitan has stored approximately 168 TAF of IID's excess conservation either through application of the California ICS Agreement and its amendment, or through application of 3.B.8 of the 2007 Interim Guidelines (aka Lake Mead Storage Program)

The December 2007 federal guidelines concerning the operation of the Colorado River system reservoirs provided the ability for agencies to create "System Efficiency ICS" through the development and funding of system efficiency projects that save water that would otherwise be lost from the Colorado River. To that end, in 2008 the Central Arizona Water Conservation District (CAWCD), SNWA, and Metropolitan contributed funds for the construction of the Drop 2 (Brock) Reservoir by the USBR. The purpose of the Drop 2 (Brock) Reservoir is to increase the capacity to regulate deliveries of Colorado River water at Imperial Dam, reducing the amount of lost storage in Lake Mead due to excess flow downstream of Imperial Dam by approximately 70 TAF annually. In return for its $25 million net contribution toward construction, operation, and maintenance, 100 TAF of water that was stored in Lake Mead was assigned to Metropolitan as System Efficiency ICS. Through 2019, Metropolitan has diverted 35 TAF of this amount, with 65 TAF remaining in storage.

In 2009, Metropolitan entered into an agreement with the United States, SNWA, the Colorado River Commission of Nevada, and CAWCD to have USBR conduct a one-year pilot operation of the Yuma Desalting Plant at one-third capacity. The pilot project operated between May 2010 and March 2011 and provided data for future decision-making regarding long-term operation of the Plant and developing a near-term water supply. Metropolitan's contribution toward plant operating costs secured 24.4 TAF of System Efficiency ICS which is still stored in Lake Mead as of January 1, 2020.

<u>Quagga Mussel Control Program</u>

The presence and spawning of quagga mussels in the lower Colorado River from Lake Mead through Lake Havasu pose a threat to Metropolitan's Colorado River Aqueduct (CRA) system and other Colorado River water users due to the potential to continuously seed water conveyance systems with mussel larvae.

Metropolitan developed the Quagga Mussel Control Program (QMCP) in 2007 to address the long-term introduction of mussel larvae into the CRA from the lower Colorado River. The QMCP consists of surveillance activities and control measures. Inspections for adult mussel infestation of submerged infrastructure are conducted during annual CRA shutdowns (usually three to four weeks). Microscopic larvae are routinely monitored throughout the year in infested lakes and at non-infested locations.

Control activities consist of continuous chlorination of the CRA system (target residual = 0.1 – 0.5 mg/L) at the outlets of Copper Basin (5 miles downstream of the intake from the Colorado River), Lake Skinner, and Lake Mathews at the western terminus of the CRA. The outlet towers at Lakes Skinner and Mathews are also chlorinated for two weeks every quarter when operations allow (0.6 mg/L target residual). Attached mussels are removed during routine cleaning of the trash racks at the Whitsett Intake Pumping Plant at the start of the CRA. The annual CRA shutdowns desiccate exposed quagga mussels, thus providing an additional control measure.

Recent shutdown inspections have demonstrated that the combined use of chlorine and regularly scheduled shutdowns effectively control mussel infestation along the length of the CRA since only few and small mussels are usually found during these inspections.

Lower Basin Drought Contingency Plan

In April 2019, the President signed legislation directing the Secretary of the Interior to sign and implement four DCP agreements related to the Upper and Lower Basin DCPs without delay. The agreements were executed, and the Upper and Lower Basin DCPs became effective on May 20, 2019 and will continue to be effective through 2026. The Lower Basin Drought Contingency Plan Agreement requires California, Arizona, and Nevada to store defined volumes of water ("DCP Contributions") in Lake Mead at specified lake levels. California would begin making contributions if Lake Mead's elevation is projected to be at or below 1,045 feet above sea level on January 1. Depending on the lake's elevation, California's contributions would range from 200 to 350 TAF a year. Pursuant to intrastate implementation agreements that terminate in 2026, Metropolitan is responsible for 93 percent of any California DCP Contribution that may be required under the Lower Basin DCP. CVWD is responsible for 7 percent of California's required DCP Contributions. In January 2020, the Lake Mead elevation was 1,090 feet; thus, no California DCP Contributions are necessary at this time. As noted above, under the Lower Basin DCP, the one-time deduction on new ICS was increased to 10 percent while the annual evaporation loss was removed.

Implementation of the Lower Basin DCP enhances Metropolitan's ability to store water in Lake Mead and to ensure that water in storage can be delivered at a later date. The Lower Basin DCP increases the total volume of water that California may store in Lake Mead by 200 TAF, which Metropolitan will have the right to use. Water stored as ICS will be available for delivery as long as Lake Mead's elevation remains above 1,025 feet. Previously, that water would likely have become inaccessible below a Lake Mead elevation of 1,075 feet. Rules are set for delivery of DCP ICS through 2026 and between 2027 and 2057.

Achievements to Date

Metropolitan has developed a number of supply and conservation programs to increase the amount of supply available from the Colorado River. The Colorado River faces long-term challenges of water demands exceeding available supply with additional uncertainties due to climate change. Metropolitan's supply and conservation programs, as well as planned additional water management programs for 2035, are shown in Table 3-1.

Table 3-1
Colorado River Program Capabilities
Year 2035
(acre-feet per year)

Hydrology	Five Year Drought (1988-1992)	Single Dry Year (1977)	Normal Year (1922-2017)
Current Programs			
Basic Apportionment – Priority 4	550,000	550,000	550,000

Subtotal of Proposed Programs	***0***	***0***	***0***
Additional Colorado River Exchange Supplies			
Exchange with SDCWA	278,000	278,000	278,000
Exchange with United States	16,000	16,000	16,000
Subtotal of Additional Colorado River Supplies	***294,000***	***294,000***	***294,000***
Maximum CR Supply Capability[2]	**1,403,500**	**1,352,500**	**1,390,500**
Less CRA Capacity Constraint (amount above 1.25 MAF)	*(153,500)*	*(102,500)*	*(140,500)*
Maximum Expected CRA Deliveries[3]	**1,250,000**	**1,250,000**	**1,250,000**

[1] DCP contribution beyond capacity of ICS accounts.
[2] Total amount of supplies available without taking into consideration CRA capacity constraint.
[3] The CRA delivery capacity is 1.25 MAF annually.

3.2 State Water Project

Much of the SWP water supply passes through the San Francisco-San Joaquin Bay-Delta (Bay-Delta). The SWP consists of a series of pump stations, reservoirs, aqueducts, tunnels, and power plants operated by DWR. Figure 3-2 shows SWP facilities. This statewide water infrastructure provides water to 29 urban and agricultural agencies throughout California. More than two-thirds of California's residents receive some of their drinking water from the Bay-Delta.

The original State Water Contract called for an ultimate delivery capacity of 4.2 MAF, with 1,911 TAF allocated to Metropolitan pursuant to its participation in the SWP. For decades, the Bay-Delta has experienced water quality and supply reliability challenges and conflicts due to variable hydrology and environmental standards that limit pumping operations. SWP deliveries in the most recent critically dry years lagged these projections and were 5 percent of contractual amounts in 2014 and 20 percent of contractual amounts in 2015. Dry conditions in 2020 also supported a supply allocation of only 20 percent. Consequently, Metropolitan's key concern is the continual deterioration of water supply reliability.

Another important concern for Metropolitan is sustained improvement in SWP water quality. Metropolitan must be able to meet the increasingly stringent drinking water regulations that are expected for disinfection by-products and pathogens in order to protect public health. Meeting these regulations will require improving the Bay-Delta water supply by cost effectively combining alternative source waters, source improvement, and treatment facilities. Additionally, Metropolitan requires water quality improvements of Bay-Delta water supplies to meet its 500 mg/L salinity blending objective in a cost-effective manner, while minimizing resource losses and helping to ensure the viability of regional recycling and groundwater management programs.

Background

Endangered Species Act Permits - The listing of several fish species as threatened or endangered under the federal or California Endangered Species Acts (respectively, the "Federal ESA" and the "California ESA" and, collectively, the "ESAs") has adversely impacted operations and limited the flexibility of the SWP. Currently, five species (the winter-run and spring-run Chinook salmon, Delta smelt, North American green sturgeon, and Central Valley steelhead) are listed under the ESAs. In addition, on June 25, 2009, the California Fish and Game Commission declared the longfin smelt a threatened species under the California ESA. Because of the listing of the various species, the federal Central Valley Project (CVP) and SWP are prohibited from "taking" the fish in their operations and must consult with federal fisheries agencies to determine whether their operations will jeopardize the existence of the species. If so, CVP and SWP must establish "reasonable and prudent alternatives" (RPAs) to normal project operations to minimize their impacts on the smelt and salmon.

In 2004 and 2005, the U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) issued biological opinions and incidental take statements that governed operations of the SWP and the CVP with respect to the Delta smelt, the winter-run and spring-run Chinook salmon, and the Central Valley steelhead. In July 2006, the USBR reinitiated consultation with the USFWS and NMFS with respect to the 2004 and 2005 biological opinions (with the addition of the North American green sturgeon, which was listed in April 2006) following the filing of legal challenges to those biological opinions and incidental take statements.

Figure 3-2
Current and Projected Facilities of the State Water Project

In 2008, USFWS issued a Biological Opinion with RPAs including criteria for operation of the CVP and SWP in a manner not likely to jeopardize the continued existence of the Delta smelt or adversely modify designated critical habitat. NMFS made a similar finding with respect to project operation effects on the listed salmon and steelhead in its revised Biological Opinion in 2009. Coordinated CVP/SWP operations were required to incorporate RPAs suggested by the agencies in the 2008 and 2009 Biological Opinions to ensure they are exempt from the otherwise applicable prohibition on "take" of Federal ESA-listed species.

To comply with the California ESA, DWR obtained consistency determinations for species listed under both ESAs and a separate Fish & Game Code Section 2081 Incidental Take Permit that authorized the incidental take of the state-listed Longfin smelt from SWP operations.

2019 Biological Opinions - In August 2016, USBR and DWR reinitiated consultation with NMFS and USFWS on the Coordinated Long-term Operations of the CVP and SWP due to new information and science on declining listed fish species populations. USBR submitted the initial biological assessment to USFWS and NMFS. The biological assessment contains a description of USBR's and DWR's proposed long-term coordinated operations plan (the "2019 Long-Term Operations Plan"). On October 21, 2019, USFWS and NMFS released their Biological Opinions. On February 18, 2020, USBR signed a Record of Decision, pursuant to the National Environmental Policy Act, completing its environmental review and adopting the 2019 Long-Term Operations Plan.

The 2019 Long-Term Operations Plan incorporates and updates many of the requirements contained in the previous 2008 and 2009 Biological Opinions. It also includes over $1 billion over a ten-year period in conservation, monitoring and new science, some of which is in the form of commitments carried forward from the previous 2008/2009 Biological Opinions. Those costs are shared by the SWP and CVP. The prior 2008 and 2009 Biological Opinions resulted in an estimated reduction in SWP deliveries of 0.3 million acre-feet during critically dry years to 1.3 million acre-feet in above normal water years as compared to the previous baseline. The 2019 Long-Term Operations Plan and 2019 Biological Opinions are expected to increase SWP deliveries by an annual average of 200,000 acre-feet as compared to the previous Biological Opinions. However, as explained further below, DWR committed to forego the anticipated improvement in the California ESA permitting process.

On December 2, 2019, a group of non-governmental organizations, including commercial fishing groups and the Natural Resources Defense Council (the "NGOs"), sued the Department of Interior, Department of Commerce, USFWS, NMFS, and USBR alleging the 2019 Biological Opinions are arbitrary and capricious, later amending the lawsuit to include claims alleged against USBR under the federal ESA and the National Environmental Policy Act. On February 20, 2020, the California Natural Resources Agency (Natural Resources), the California Environmental Protection Agency, and the Attorney General (collectively, the "State Plaintiffs") sued the federal agencies, making allegations similar to the NGOs, but also alleging that USBR must obtain a California ESA permit for CVP operations that cause incidental take of the state-listed Longfin smelt. The State Water Contractors intervened in both cases to defend the 2019 Biological Opinions. In May 2020, the court granted, in part, a preliminary injunction that affected CVP operations only for a short time in May. The federal defendants are nearing completion of the administrative records that will form the evidentiary basis for briefing the merits of the cases, and the court has issued a briefing schedule for any objections to the administrative records. Once the administrative records are finalized, the parties anticipate filing cross-motions for summary judgment. The outcome of those cross-motions may obviate the need for a trial.

California ESA Incidental Take Permit - DWR described and analyzed its proposed SWP long-term operations plan for purposes of obtaining a new California ESA permit in its November 2019 Draft EIR under CEQA. Its 2019 Draft EIR proposed essentially the same operations plan as for the federal 2019 Biological Opinions, with the addition of operations for the California ESA-listed Longfin smelt. The proposed project included an estimated $540 million in conservation, monitoring and science, much of which overlapped with DWR's share of the estimated $1 billion under the federal 2019 Biological Opinions. In December 2019, DWR submitted its application for an incidental take permit under the California ESA to the California Department of Fish and Wildlife (CDFW), with a modified State operations plan that added new outflow and environmental commitments. On March 27, 2020, DWR released its final EIR and Notice of Determination, describing and adopting a State operations plan with additional operational restrictions and additional conservation commitments. On March 31, 2020, CDFW issued a California ESA incidental take permit for the SWP that included further operational restrictions and outflow. The final approved project and incidental take permit reduce long-term average SWP deliveries by more than 200 TAF, which more than erased any potential improvement in SWP water supplies that were anticipated to result from the 2019 Biological Opinions. In addition, the approved project and incidental take permit add another estimated $218 million over a ten-year period in environmental commitments for the SWP beyond the SWP's share of the $1 billion required to comply with the 2019 Biological Opinions.

On April 28, 2020, Metropolitan and Mojave Water Agency (Mojave) jointly sued CDFW, DWR and Natural Resources, alleging that the new California ESA permit and Final EIR violate CEQA and the California ESA. Metropolitan and Mojave also allege that DWR breached their respective State Water Contracts and the implied covenant of good faith and fair dealing by, among other things, accepting an incidental take permit containing mitigation or other measures in excess of that required by law. The State Water Contractors and the Kern County Water Agency also filed CEQA and CESA actions, and a CEQA challenge was filed by several federal contractors. In addition, San Bernardino Valley Municipal Water District sued CDFW and DWR, alleging CEQA and CESA violations, breach of its State Water Contract and the implied covenant, as well as unconstitutional takings and anticipatory repudiation of contract claims. Four other lawsuits also have been filed by certain commercial fishing groups and a tribe, several environmental groups, and two in-Delta water agencies challenging the Final EIR as inadequate under CEQA and, in some of the cases, alleging violations of the California ESA, Delta Reform Act, public trust doctrine and, in one of the cases, certain water right statutes. Since the initial filings, Coachella Valley Water District, San Gorgonio Pass Water Agency and the Municipal Water District of Orange County have joined Metropolitan's case; and nine individual State Water Contractors joined the SWC and Kern County Water Agency in their case, adding breach of contract and implied covenant claims. All eight cases have been ordered coordinated, and a stay has been imposed on any discovery until modified or lifted by the coordination trial judge. At this time, Metropolitan is unable to assess the likelihood of success of any litigation relating to the California ESA permit, including any future litigation or any future claims that may be filed, or any potential effect on Metropolitan's SWP water supplies.

Bay-Delta Water Quality Control Plan Update/Voluntary Agreements – The State Water Resources Control Board (SWRCB) is the agency responsible for setting water quality standards and administering water rights throughout California. The SWRCB exercises its regulatory authority over the Bay-Delta and its tributaries by means of public proceedings leading to regulations and decisions that can affect the availability of water to Metropolitan and other users of SWP water. These include the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (Bay-Delta Plan), which establishes the water quality objectives and proposed flow regime of the estuary, and water rights decisions, which assign responsibility for implementing the objectives of the Bay-Delta Plan to users throughout the system by adjusting their respective water rights permits.

Since 2000, SWRCB's Water Rights Decision 1641 (D-1641) has governed the SWP's ability to export water from the Bay-Delta for delivery to Metropolitan and other agencies receiving water from the SWP. D-1641 allocated responsibility for meeting flow requirements and salinity and other water quality objectives established earlier by the Bay-Delta Plan.

The Bay-Delta Plan gets reviewed periodically, and new standards and allocations of responsibility can be imposed on the SWP as a result. The last review was completed in 2006, and the current review has been ongoing since approximately 2010 in a phased approach.

Phase 1 focuses on the southern Delta salinity objectives for the protection of agriculture, San Joaquin River flow objectives for the protection of fish and wildlife, and a program of implementation for achieving those objectives. Phase 2 considers the comprehensive review of the other elements of the Bay-Delta Plan, including but not limited to Sacramento River and Delta outflow objectives.

The SWRCB has also encouraged all stakeholders to work together to reach one or more voluntary agreements for consideration by the SWRCB that could implement the proposed amendments to the Bay-Delta Plan through a variety of tools, while seeking to protect water supply reliability. Metropolitan is participating in the Phase 2 proceedings and voluntary agreement negotiations. In March of 2019, DWR and CDFW put forward a project description and planning agreement that would allow the SWRCB to analyze the environmental impacts and benefits of the voluntary agreement alternative to the percentage of unimpaired flow framework.

In December 2018, the SWRCB adopted the Phase 1 Bay-Delta Plan amendments and Final Substitute Environmental Document. Among other things, the Phase 1 updates established new Lower San Joaquin River (LSJR) flow objectives and revised southern Delta salinity objectives. The LSJR flow objectives for February through June require 40 percent of unimpaired flow, based on a minimum 7-day running average, from each of the Stanislaus, Tuolumne, and Merced Rivers, with the ability to adjust between 30 and 50 percent through adaptive management, and with certain minimum base flows. The SWRCB estimates that the new LSJR flow objectives will reduce water available for human consumptive use by between 7 and 23 percent, on average, and 38 percent in critically dry years.

On February 25, 2019, the Office of Administrative Law approved the Phase 1 amendments, which are now in effect. The SWRCB plans to fully implement the new LSJR flow objectives through adjudicatory (water rights) and regulatory (water quality) processes by 2022. The SWRCB has stated that it encourages voluntary agreements that will assist in implementing the LSJR flow objectives through a combination of flow and non-flow habitat restoration measures, and will consider such agreements as part of its proceedings to implement the Phase 1 Bay-Delta Plan update, consistent with its obligations under applicable law.

In July of 2018, the SWRCB released a framework that describes the draft proposal for Phase 2, which will update the flow requirements for the Delta and its contributing watersheds, including the Sacramento River and its tributaries. The framework provides additional details about the flow requirements staff is likely to propose, how these new requirements could be implemented, and preliminary information on their potential environmental benefits and water supply effects. Among other things, SWRCB staff anticipate proposing an inflow level of 45-65 percent of unimpaired flow, with a starting point of 55 percent. The proposed program of implementation would allow voluntary agreements with nonflow measures to be lower in the range – so long as the measures provide the same level of resource protection as 55 percent, and that the agreement is still within the range of 45-65 percent. The framework states that the SWRCB is interested in receiving potential Bay-Delta Plan amendment language developed through the voluntary agreement process that would authorize, with the affirmative concurrence from CDFW, a coordinated control of flows and other, non-flow factors that would achieve benefits comparable to the unimpaired flow requirements.

Other issues, such as the recent decline of some fish populations in the Bay-Delta and surrounding regions and certain operational actions in the Bay-Delta, may significantly reduce Metropolitan's water supply from the Bay-Delta. Future new or revised Biological Opinions or incidental take authorizations under the Federal ESA and California ESA might further adversely affect SWP and CVP operations. Additionally, new litigation, listings of additional species under the ESAs, or new regulatory requirements imposed by the SWRCB could further adversely affect SWP operations in the future by requiring additional export reductions, releases of additional water from storage, or other operational changes impacting water supply operations. Metropolitan cannot predict the ultimate outcome of any of the litigation or regulatory processes described above, but believes they could have an adverse impact on the operation of the SWP pumps, Metropolitan's SWP supplies, and Metropolitan's water reserves.

Operational constraints likely will continue until a long-term solution to the problems in the Bay-Delta is identified and implemented. The Delta Vision process, established by Governor Schwarzenegger, was aimed at identifying long-term solutions to the conflicts in the Bay-Delta, including natural resource, infrastructure, land use, and governance issues. In addition, State resource agencies and various water user entities are currently engaged in the development of the Delta Conveyance Project, which is aimed at making physical and operational improvements to the SWP system in the Delta necessary to access south-of-Delta SWP water supplies and restore and protect water quality by addressing anticipated sea-level rise, seismic risks, and by providing operational flexibility to improve aquatic conditions in the Delta and better manage risks of further regulatory constraints on SWP operations.

Changed Conditions

In August 2020, DWR released the 2019 State Water Project Delivery Capability Report. The 2019 Delivery Capability Report presents the current DWR estimate of the amount of water deliveries for current (2019) conditions and conditions 20 years in the future for each SWP contractor under a range of hydrologic conditions. These estimates incorporate regulatory requirements in accordance with the SWRCB Water Quality Control Plan, the USFWS and NMFS Biological Opinions and the CDFW Incidental Take Permit. In addition, these estimates incorporate 2018 amendments to the Coordinated Operations Agreement between the SWP and CVP. Future capability estimates also reflect the potential impacts of climate change and sea level rise. Under the 2019 Delivery Capability report, the delivery estimates for the SWP for 2019 conditions as a percentage of Table A amounts are 7 percent, equivalent to 134 TAF for Metropolitan, under a single dry year (1977) condition and 58 percent, equivalent to 1.1 MAF for Metropolitan, under long-term average conditions.

Implementation Approach

Metropolitan's implementation approach for the SWP depends on the full use of the current State Water Contract provisions, including its basic contractual amounts and Article 21 interruptible supplies. In addition, it requires successful negotiation and implementation of a number of agreements. Each of these stakeholder processes or agreements involves substantial Metropolitan and member agency staff involvement to represent regional interests. Metropolitan is committed to working collaboratively with DWR, SWP contractors, and other stakeholders to ensure the success of these extended negotiations and programs.

SWP Reliability

This discussion provides details of the major actions Metropolitan is undertaking to improve SWP reliability.

Delta Conveyance Project – Planning for a Delta conveyance project to address declining populations of sensitive fish species and the increasingly restrictive permit conditions began decades ago. In the mid-1990s, a consortium of federal, state, and local agencies including Metropolitan entered the Bay-Delta Accord, which included hundreds of millions of dollars for ecosystem restoration in the Delta and its salmon-bearing tributaries. In 2000, a similar consortium completed the CALFED analysis of a program of ecosystem restoration and improvements to Delta conveyance and issued a Record of Decision that included dual conveyance as an alternative. In April 2006, the CALFED Program issued a 10-year Action Plan to refocus the program based on new scientific and policy information. The scientific information indicated that the current physical configuration of the Delta did not lead to a sustainable condition due to increasing risk of seismic events and sea level rise; and that population levels for Delta pelagic (open water) organisms were at record low levels and were appearing to continue to decline.

The 10-year Action Plan also indicated that several water users were considering the development of a habitat conservation plan for the Delta. This effort was the initiation of the Bay Delta Conservation Plan (BDCP), which began with the support and participation of water suppliers, including Metropolitan. One of the conservation measures included new points of diversion on the Sacramento River in the north Delta connected by a canal or two tunnels to Clifton Court Forebay (part of the SWP) in the south Delta.

In September 2006, Governor Schwarzenegger signed Executive Order S-17-06, which launched the Delta Vision process by establishing a Blue-Ribbon Task Force, a cabinet-level Delta Vision Committee, Delta Science Advisors, and a Stakeholder Coordination Group. The executive order charged the Blue-Ribbon Task Force with developing both a long-term vision for a sustainable Delta and a plan to implement that vision. The Delta Vision Committee recommended, among other things, creation of a state plan for the Delta and Suisun Marsh aimed at landscape-scale ecosystem restoration and a new Delta conveyance infrastructure to create a dual system of conveyance. On February 28, 2008, Governor Schwarzenegger, in a letter to state Senators Perata, Machado, and Steinberg, stated his intention to direct DWR to proceed with preparation of environmental review and permitting activities for the BDCP.

In 2009, in light of the Delta Vision reports and recommendations, the Legislature enacted the Sacramento-San Joaquin Delta Reform Act of 2009, which established the coequal goals for the Delta of ecosystem restoration and restoration of reliable SWP and CVP supplies, created the Delta Stewardship Council, and charged the new agency with development of a Delta Plan to further the coequal goals in a manner that protects and enhances the Delta as an evolving place. The Delta Reform Act and the first Delta Plan, adopted in 2013, called for incorporation of the BDCP into the Delta Plan if it met state and federal requirements for a habitat conservation plan and natural communities' conservation plan.

The BDCP planning process continued under Governor Brown, but in light of comments on the BDCP, DWR began analyzing three new sub-alternatives to the BDCP that involved new conveyance independent of any landscape-scale habitat restoration called the California WaterFix. At the same time, Governor Brown initiated California EcoRestore, which was aimed at restoration of 30,000 acres of fish habitat in the Delta. In July 2017, DWR approved California WaterFix. Metropolitan's Board authorized participation in California WaterFix in October 2017, and again in April and July of 2018.

In his State of the State address delivered February 12, 2019, Governor Newsom announced that he did not "support WaterFix as currently configured," but does "support a single tunnel." On April 29, 2019, Governor Newsom issued Executive Order N-10-19, directing several agencies to (among other things) "inventory and assess… [c]urrent planning to modernize conveyance through the Bay Delta with a new single tunnel project." The Governor's announcement and Executive Order led to DWR's withdrawal of all approvals and environmental compliance documentation associated with California WaterFix. The CEQA process identified in this notice for the proposed Delta Conveyance Project will, as appropriate, utilize relevant information from the past environmental planning process for California WaterFix, but the proposed project will undergo a new stand-alone environmental analysis leading to issuance of a new EIR.

On January 15, 2020, DWR issued a Notice of Preparation of an Environmental Impact Report for the DCP, stating:

> *DWR's underlying, or fundamental, purpose in proposing the project is to develop new diversion and conveyance facilities in the Delta necessary to restore and protect the reliability of State Water Project (SWP) water deliveries and, potentially, Central Valley Project (CVP) water deliveries south of the Delta, consistent with the State's Water Resilience Portfolio.*
>
> *The above stated purpose, in turn, gives rise to several project objectives. In proposing to make physical improvements to the SWP Delta conveyance system, the project objectives are:*

- *To address anticipated rising sea levels and other reasonably foreseeable consequences of climate change and extreme weather events.*
- *To minimize the potential for public health and safety impacts from reduced quantity and quality of SWP water deliveries, and potentially CVP water deliveries, south of the Delta resulting from a major earthquake that causes breaching of Delta levees and the inundation of brackish water into the areas in which the existing SWP and CVP pumping plants operate in the southern Delta.*
- *To protect the ability of the SWP, and potentially the CVP, to deliver water when hydrologic conditions result in the availability of sufficient amounts, consistent with the requirements of state and federal law, including the California and federal Endangered Species Acts and Delta Reform Act, as well as the terms and conditions of water delivery contracts and other existing applicable agreements.*
- *To provide operational flexibility to improve aquatic conditions in the Delta and better manage risks of further regulatory constraints on project operations*

The proposed project would construct and operate new conveyance facilities in the Delta that would add to the existing SWP infrastructure. New intake facilities as points of diversion would be located in the north Delta along the Sacramento River between Freeport and the confluence with Sutter Slough. The new conveyance facilities would include a single main tunnel to convey water from the new intakes to the existing Banks Pumping Plant and potentially the federal Jones Pumping Plant in the south Delta. The new facilities would provide an alternate location for diversion of water from the Delta and would be operated in coordination with the existing south Delta pumping facilities. The new north Delta facilities would be sized to convey up to 6,000 cfs of water from the Sacramento River to the SWP facilities in the south Delta. DWR would operate the dual conveyance system in compliance with all state and federal regulatory requirements and would not reduce DWR's current ability to meet standards in the Delta to protect biological resources and water quality for beneficial uses.

Contract Amendments – Metropolitan and other State Water Contractors have undertaken negotiations with DWR to extend their State Water Contracts. In June 2014, DWR and the State Water Contractors reached an Agreement in Principle (the "Agreement in Principle") on an amendment to the State Water Contracts to extend the contracts and to make certain changes related to financial management of the SWP in the future. DWR and 25 of the State Water Contractors, including Metropolitan, have signed the Agreement in Principle. Under the Agreement in Principle, the term of the State Water Contract for each Contractor that signs an amendment would be extended until December 31, 2085. The Agreement in Principle served as the "proposed project" for purposes of environmental review under CEQA. DWR issued a Notice of Availability of the Draft Environmental Impact Report ("EIR") for the proposed project on August 17, 2016. DWR released the Final EIR on November 16, 2018 and certified the final EIR and issued a Notice of Determination on December 11, 2018. Concurrently, Metropolitan considered the certified final EIR and approved the water supply contract extension amendment at its December 11, 2018 Board meeting. That same day, DWR filed a lawsuit seeking to validate the contract extension. In January of 2019, two groups of plaintiffs filed lawsuits challenging DWR's Final EIR and approval of the Contract Extension under CEQA, the Delta Reform Act, and public trust doctrine. Those cases have been related to the validation action and are pending before the same judge. To date, 21 of the 29 State Water Contractors have executed the amendment, achieving the DWR established threshold needed for it to be fully executed. DWR is awaiting a decision from the trial court on the validation litigation described above before moving forward with execution of the amendments with individual State Water Contractors.

In a process separate from the State Water Contract extension amendment described above, Metropolitan and other State Water Contractors undertook public negotiations with DWR to amend their State Water Contracts to clarify how costs would be allocated for the California WaterFix, as well as to clarify the criteria applicable to certain water management tools including single and multi-year water transfers and exchanges between State Water Contractors. DWR and the State Water Contractors reached an Agreement in Principle in 2018 (the "2018 AIP"), and DWR issued a Draft EIR. On April 29, 2019, Governor Newsom issued the executive order directing State agencies to develop a comprehensive statewide strategy to build a climate-resilient water system that included consideration of a single-tunnel Delta conveyance facility instead of the approved California WaterFix project. DWR removed the WaterFix cost provisions from the 2018 AIP and, on February 28, 2020, recirculated the Draft EIR for only the 2018 AIP's water management provisions. DWR certified a Final EIR for the water management tools AIP in August 2020 and finalized contract language in October 2020. Since then, all but three of the SWP contractors have approved and signed the amendments, including Metropolitan, which approved the amendments on February 9, 2021. As a result, the amendments became effective on February 28, 2021. The water management provisions allow for greater flexibility for transfers and exchanges among those public agencies with State Water Contracts. Specifically, it would confirm existing practices for exchanges, allow more flexibility for non-permanent water transfers, and allow for the transfer and exchange of certain portions of Article 56 carry over water.

In light of the shift from California WaterFix to the Delta Conveyance Project, Metropolitan and other State Water Contractors embarked on a third public process to further negotiate proposed amendments related to cost allocation for a potential new Delta Conveyance Project. In March of 2020, DWR and the State Water Contractors reached an Agreement in Principle ("Delta Conveyance AIP") for the allocation of costs and benefits for a Delta Conveyance project based on an allocation of proportionate shares. The Delta Conveyance AIP provides a mechanism that would allow for the costs related to any Delta Conveyance project to be allocated for and collected by DWR. The Delta Conveyance AIP also provides for the allocation of benefits for any Delta Conveyance project. Additionally, the Delta Conveyance AIP includes a white paper that describes how DWR would account for and administer any Delta Conveyance project benefits and costs if a project were implemented today. Contract language is under development, and any contract approval would follow DWR completing the Delta Conveyance Project environmental review.

COA Addendum – DWR operates the SWP in coordination with the federal CVP, which is operated by USBR. Since 1986, the coordinated operations have been undertaken pursuant to a Coordinated Operations Agreement for the Central Valley Project and State Water Project (the "COA"). The COA defines how the State and federal water projects share water quality and environmental flow obligations imposed by regulatory agencies. The agreement calls for periodic review to determine whether updates are needed in light of changed conditions. After completing a joint review process, DWR and USBR agreed to amend the COA to reflect water quality regulations, Biological Opinions, and hydrology updated since the 1986 agreement was signed. On December 13, 2018, DWR and USBR executed an Addendum to the COA (the "COA Addendum"). Through the COA Addendum, DWR will adjust current SWP operations to modify pumping operations, as well as project storage withdrawals to meet in-basin uses, pursuant to revised calculations based on water year types. The COA Addendum will shift responsibilities for meeting obligations between the CVP and the SWP, resulting in a shift of approximately 120 TAF in long-term average annual exports from the SWP to the CVP. In executing the COA Addendum, DWR found the agreement to be exempt from environmental review under the California Environmental Quality Act ("CEQA") as an ongoing project and that the adjustments in operations are within the original scope of the project. On January 16, 2019, commercial fishing groups and a tribe ("petitioners") filed a lawsuit against DWR alleging that entering into the COA Addendum violated CEQA, the Delta Reform Act, and the public trust doctrine. The parties are in the process of completing the administrative record, which will form the evidentiary basis at trial, which has not been set at this time.

Ecosystem Restoration – The main objective under the EcoRestore Program is the restoration of at least 30,000 acres of Delta habitat, with the near-term goal of making significant strides toward that objective by 2020. These restoration programs include projects and actions that comply with pre-existing regulatory requirements designed to improve the overall health of the Delta. Other priority restoration projects would also be identified by the Sacramento-San Joaquin Delta Conservancy and other agencies and local governments. Funding is provided through multiple sources, including various local and federal partners, state bonds, and other state-mandated funds. SWP/CVP contractors have provided funds as part of existing regulatory obligations imposed on the SWP and CVP.

Delta Science Initiatives – Metropolitan's Bay-Delta science program supports water supply reliability and ecosystem restoration by protecting the Bay-Delta environment, driving better management decisions, and fostering effective regulations. Metropolitan is conducting a science program to ensure that regulations effectively protect aquatic species while ensuring a reliable water supply. The key elements of the science program include: (1) staff with scientific expertise to design, manage and participate in scientific investigations addressing Metropolitan's priorities; (2) funding science studies through direct funding, collaborations, staff in-kind contributions, and by pursuing external grant funding sources to leverage Metropolitan's science investments; (3) collaborations with external organizations to conduct science studies, including the State Water Contractors, Collaborative Science and Adaptive Management Program (CSAMP), Interagency Ecological Program agencies, Delta Stewardship Council Delta Science Program, and university scientists; and (4) participation in the Bay-Delta science community through communication of science study findings, participation in science conferences and publishing results of scientific studies in peer reviewed journals.

Metropolitan's Bay-Delta science efforts focus on three priority areas of water operations to protect Delta fish, Delta stressors and habitat needs of listed fish species.

- Water Operations to Protect Delta Fish. A priority focus for the science program is to develop a better understanding of the effect of water project operations on the health, abundance, and distribution of listed fish species, including Delta smelt, longfin smelt and Chinook salmon. The science program includes investigation of the mechanisms behind flow-abundance relationships observed in analysis of fish survey data for Delta smelt and longfin smelt, factors that affect adult Delta smelt, salmon and steelhead entrainment risk at the CVP and SWP export facilities, potential bias in fish survey data, and development of effective methods to study Delta smelt without collecting or harming the fish.
- Delta Stressors. Multiple stressors in the Bay-Delta ecosystem affect the health, abundance, and distribution of listed fish species; however, we have limited understanding of the impacts of various stressors and their specific role in the decline of listed species. The science program includes investigation into key stressors to develop information that can support development of effective management actions. These studies include investigation into predation impacts on salmon, toxic contaminant effects on Delta smelt and juvenile salmon, and the effects of nutrients on the food web.
- Habitat Needs for Delta Fish. Compared to the historical Delta, the modern Delta is highly altered and has a small fraction of tidal marsh habitat remaining and greatly reduced levels of primary production. Food and habitat limitation have been identified as important stressors for listed species. The science program includes investigation of salmon habitat needs, pilot studies to enhance the food web, longfin smelt habitat studies, pilot projects to benefit Delta smelt, monitoring the effectiveness of habitat improvement actions, and evaluation of land use and habitat opportunities on Metropolitan's Delta Island properties.

SWP Terminal Storage

Metropolitan has contractual rights to 65 TAF of flexible storage at Lake Perris (East Branch terminal reservoir) and 154 TAF of flexible storage at Castaic Lake (West Branch terminal reservoir). This storage provides Metropolitan with additional options for managing SWP deliveries to maximize yield from the project. Over multiple dry years, it can provide Metropolitan with 44 TAF of additional supply. In a single dry year like 1977, it can provide up to 219 TAF of additional supply to Southern California.

Yuba Dry Year Water Purchase Program

In December 2007, Metropolitan entered into an agreement with DWR providing for Metropolitan's participation in the Yuba Dry Year Water Purchase Program between Yuba Water Agency and DWR. This program provides for transfers of water from the Yuba Water Agency during dry years through 2025.

Desert Water Agency/Coachella Valley WD SWP Table A Transfer

Under the transfer agreement, Metropolitan transferred 100 TAF of its SWP Table A contractual amount to Desert Water Agency/CVWD (DWCV). Under the terms of the agreement, DWCV pays all SWP charges for this water, including capital costs associated with capacity in the California Aqueduct to transport this water to Perris Reservoir, as well as the associated variable costs. The amount of water actually delivered in any given year depends on that year's SWP allocation. Water is delivered through the existing exchange agreements between Metropolitan and DWCV, under which Metropolitan delivers Colorado River supplies to DWVC equal to the SWP supplies delivered to Metropolitan. While Metropolitan transferred 100 TAF of its Table A amount, it retained other rights, including interruptible water service; its full carryover amounts in

San Luis Reservoir; its full use of flexible storage in Castaic and Perris Reservoirs; and any rate management credits associated with the 100 TAF.

Desert Water Agency/Coachella Valley WD Exchange and Advance Delivery Program

Under this program, Metropolitan delivers Colorado River water to the Desert Water Agency and CVWD in advance of the exchange for their SWP Contract Table A allocations. In addition to their Table A supplies, Desert Water Agency and CVWD may take delivery of other SWP supplies available to SWP Contractors. By delivering enough water in advance to cover Metropolitan's future exchange obligations, Metropolitan is able to receive Desert Water Agency and CVWD's available SWP supplies without having to deliver an equivalent amount of Colorado River water. This program allows Metropolitan to maximize delivery of SWP water in wet years by enabling delivery of Colorado River supplies to storage in the Advance Delivery Program instead of to the service area. These Table A deliveries are incorporated into the estimate of SWP Deliveries under Current Programs shown in Table 3-2.

Desert Water Agency/Coachella Valley WD Other SWP Deliveries

Since 2008, Metropolitan has provided Desert Water Agency and CVWD written consent to take delivery of non-SWP supplies separately acquired by each agency from the SWP facilities. These deliveries include water acquired from the Yuba Dry Year Water Purchase Program, the Multi-Year Water Pool, the 2009 Drought Water Bank, and long-term water supplies purchased by CVWD from Rosedale Rio-Bravo Water Storage District. Metropolitan has also consented to:

- 10 TAF of exchange deliveries to CVWD for non-SWP water acquired from the San Joaquin Valley from 2008 through 2010,
- 36 TAF of exchange deliveries to Desert Water Agency for non-SWP water acquired from the San Joaquin Valley from 2008 through 2015, and
- 16.5 TAF of exchange deliveries to CVWD from groundwater storage of Kern River flood flows or SWP water delivered from Kern County Water Agency provided by Rosedale Rio Bravo Water Storage District from 2012 through 2035.

Effective in 2020, Metropolitan, Desert Water Agency and CVWD executed an amendment to the Advance Delivery Program and exchange of water. Among its provisions is the termination of Metropolitan's right to an annual option to call-back the 100,000 acre-feet Table A transfer. It also provides that Metropolitan will deliver Article 21 and non-SWP water supplies for Desert and CVWD to the extent that Metropolitan has available capacity. This agreement also includes an additional exchange of 15 TAF per year from 2020 to 2026. However, as the source of the exchange is water CVWD can call from the ID/MWD Conservation Program, which is Colorado River water, this exchange is discussed in more detail in the IID/MWD Conservation Program section.

Table 3-2 summarizes Metropolitan's SWP supply range for 2035. Appendix 3 provides a detailed discussion of the current SWP programs and programs that are under development.

Table 3-2
California Aqueduct
Program Capabilities
Year 2035
(acre-feet per year)

Hydrology	Five Year Drought (1988-1992)	Single Dry Year (1977)	Normal Year (1922-2017)

[2] Includes DWCV carryover.

SWP Water Quality

Metropolitan requires a safe drinking water supply from the Bay-Delta to meet current and future regulatory requirements for public health protection. Finding cost-effective ways to reduce total organic carbon (TOC), bromide concentrations, pathogenic microbes, and other unknown contaminants from the Bay-Delta water supply is one of Metropolitan's top priorities. Metropolitan also requires a SWP supply that is consistently low in salinity - Total Dissolved Solids (TDS) - so it can blend SWP water with higher-salinity Colorado River water to achieve salinity goals for its member agencies. In addition, Metropolitan needs consistently low-salinity SWP water to increase in-basin water recycling and groundwater management programs. These programs require that blended water supplied to the member agencies meets the TDS goal adopted by Metropolitan's Board, which specifies a salinity objective of 500 mg/L for blended imported water.

Metropolitan is actively involved in DWR's Municipal Water Quality Investigations (MWQI) Program. The highly variable quality of SWP water influences the operation of Metropolitan's system and its water treatment process. Increasingly restrictive State and Federal drinking water standards, concerns over emerging contaminants such as personal care products and pharmaceuticals, algal taste and odors, and Delta ecosystem fisheries issues are critical variables. DWR's MWQI Program strives to monitor, protect, and improve drinking water quality of Delta water deliveries to the urban State Water Contractors and other users of Delta water. The program focuses on issues related to drinking water quality through regular water quality monitoring, special field and laboratory studies, the use of forecasting tools such as computer models and data management systems, and reporting. While the program has developed extensive monitoring in the Delta including real-time monitoring, increased monitoring along the California Aqueduct is the next major step.

Levee modifications at Franks Tract and other source control actions may significantly reduce ocean salinity concentrations in Delta water, which would benefit Delta water users and export interests alike. Franks Tract is an island located in the central Delta that was actively farmed until levee breaches in 1936 and 1938. Since 1938, the tract has remained a flooded island, and its levees remain in disrepair. Tidal flows in the Delta entrap saline ocean water in the flooded tract, resulting in degraded water quality for both in-Delta and export users. Computer modeling analyses by Metropolitan, DWR, and the US Geological Survey indicate that reducing this salinity intrusion by partially closing existing levee breach openings and/or building radial gate flow control structures will significantly reduce TDS and bromide [2] concentrations in water from the Delta during the summer and fall months and in drought years.

In 2016, the California Department of Fish and Wildlife (CDFW), as part of the 2016 Delta Smelt Resiliency Strategy, began a process of working with the local community, local agencies, and interested stakeholders in developing a habitat enhancement plan for Franks Tract called the Franks Tract Restoration Feasibility Study. The objective was to assess the feasibility of restoring components of the historic tidal marsh form and function to create habitat suitable for Delta Smelt, reduce the extent of aquatic weeds, decrease predation on Delta Smelt and other native fishes by lowering habitat suitability for non-native species, modify hydrology to something more similar to historical conditions, improve food webs, and improve water quality in the interior Delta, which would benefit both in-Delta diverters and SWP and CVP supplies. In its current state of shallow open water, Franks Tract facilitates salinity intrusion into the mid-Delta as a result of tidal pumping through False River. Restoration designs focus on minimizing tidal pumping from False River. In 2018, CDFW determined that it is feasible to achieve the project objectives. In response to community concerns, in July 2019, CDFW, in cooperation with the Department of Parks and Recreation, launched a second round of planning that lasted from August 2019 through September 2020. Stakeholders, advisors, and the public chose the Central Landmass as the preferred design concept as documented in the Franks Tract Futures 2020 Reimagined report published in September 2020.

The state has adopted an "equivalent level of public health protection" (ELPH) program that targets water quality actions outside the Delta. The Bay-Delta Program is coordinating a feasibility study on water quality improvement in the California Aqueduct.

Metropolitan and the Friant Water Users Authority (FWUA) have entered into a partnership to investigate the potential of enhancing the quantity and affordability of the eastern San Joaquin Valley's water supply while improving Southern California's water quality. The FWUA and Metropolitan studied projects that benefited both regions. Using Proposition 13 funds, an existing canal belonging to the Arvin-Edison Water Storage District was enlarged, enabling greater volumes of water to be exchanged between their groundwater and the California Aqueduct.

SWP System Outage and Capacity Constraints

The California Aqueduct is experiencing reduction in flow capacity in certain areas due to ongoing land subsidence. Subsidence has been observed in the San Joaquin Valley since the 1920s, and subsidence was included in the planning and design of the California Aqueduct. The DWR published a detailed study in 2017 describing the impacts of subsidence in the reduction of concrete liner freeboard and the ability to store water in certain pools, reducing operational flexibility and increasing power costs. Through 2016, no contracted deliveries had been curtailed due to subsidence, but DWR has a subsidence program aimed to proposed improvements to the California Aqueduct and restore capacity, as well as work with the Groundwater

[2] The importance of managing bromides is discussed in the Water Quality chapter.

Sustainability Agencies that cover the extension of the California Aqueduct to minimize future subsidence.

In 2015, Metropolitan, DWR, and the Los Angeles Department of Water and Power formed the Seismic Resilience Water Supply Task Force (SRWSTF). The goal of the SRWSTF is to collaborate on studies and mitigation measures aimed at improving the reliability of imported water supplies to Southern California. The SRWSTF aims to identify options to accelerate initial repairs acting as one agency and establish consensus on regional priorities for aqueduct repairs.

Because of the risk of a prolonged shutdown of the SWP caused by seismic or hydrologic events either within the Delta or along the California Aqueduct, Metropolitan has acted to ensure that Southern California has adequate emergency storage. Diamond Valley Lake (DVL) and SWP terminal reservoir storage, combined with member-agency emergency storage, are jointly capable of providing the region with a six-month supply of water if combined with a temporary 25 percent reduction in demand. Metropolitan engineering studies indicate this would provide sufficient time to repair the SWP and resume delivery.

Following the February 2017 Oroville spillways incident, DWR initiated a Comprehensive Needs Assessment (CNA). The CNA is led by DWR and technically reviewed by an Independent Review Board (IRB) composed of dam safety experts. The CNA is not investigating the causes of the February 2017 incident, but rather aims to identify actions to be taken by DWR to improve the resilience of the Oroville Dam complex. The report was released in November 2020 with a determination that Oroville is safe to operate, and no urgent repairs are needed. Several risk-reduction projects are currently being implemented and more projects are anticipated into the near future.

DWR is also investing to reduce seismic and hydrologic risk of aging SWP infrastructure critical in Southern California. A major retrofit to Perris Dam (Riverside County) was completed in April 2018, and other two major projects to improve seismic stability are currently under development with planned construction to start in a few years. Pyramid Dam and Castaic Dam (Los Angeles County) are also being studied with the planned assessment work estimated to be completed by 2022 and complete modernization work to take about 10 years to complete.

Achievements to Date

SWP Reliability

Metropolitan's Long-Term Action Plan

Besides the short- and mid-term actions described earlier in Section 1.4, Metropolitan's adopted Delta action plan in June 2007 includes a long-term Delta Plan. The long-term action plan recognizes the need for a global, comprehensive approach to the fundamental issues and conflicts in the Delta to result in a truly sustainable Delta. A piecemeal approach cannot satisfy the many stakeholders that have an interest in the Delta and will fail; there must be a holistic approach that deals with all issues simultaneously. In dealing with the basic issues of the Delta, solutions must address the physical changes required, as well as the financing and governance. There are three basic elements that must be addressed: Delta ecosystem restoration, water supply conveyance, and flood control protection and storage development. In addition, the state needs to establish governance structures and financing approaches to implement and manage the three identified elements.

Governor's Delta Vision Process

Through this enduring Delta crisis, the Legislature and the Governor initiated in 2006 a process to develop a new long-term vision for the Delta. SB 1574 (Kuehl/2006) required a cabinet committee to present recommendations for a Delta strategic vision. The governor created a Delta Vision Blue-Ribbon Task Force to advise the Cabinet Committee. The Task Force produced an October 2008 Strategic Plan, which the Cabinet Committee largely adopted and submitted, with its recommendations, to the Legislature on January 3, 2009. Metropolitan, as a stakeholder in the process, provided input to the Task Force.

The 2009 Delta Legislation

After delivery of the Delta Vision recommendations, the Legislature held informational hearings from Delta experts, Task Force members, and the Schwarzenegger Administration, as well as the public at large, and engaged in vigorous water policy discussions. Following the informational hearings, several legislators began developing detailed legislation which culminated in pre-print proposals being issued in early August of 2009 for public review and discussion over the summer recess. The Assembly Water, Parks and Wildlife Committee and the Senate Natural Resources and Water Committee then held joint informational hearings on the pre-print proposals and received extensive public comment. Thereafter, legislative leadership appointed a conference committee, which convened and held additional public hearings, with further legislator discussions on key issues. That work continued into the 7th Extraordinary Session, which was called by the governor specifically to address the pending Delta and water issues, and culminated in the signing of a historic package of bills. One of the keystones of that package was SB X7-1, which reformed Delta policy and governance. Specifically, SB X7-1:

- Established a new legal framework for Delta management, emphasizing the coequal goals of "providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem" as foundation for state decisions as to Delta management.
- Reconstituted and redefined the role of the Delta Protection Commission (DPC) to narrow membership to focus on local representation and to expand the DPC's role in economic sustainability.
- Created a new Sacramento-San Joaquin Delta Conservancy (Conservancy) to support efforts that advance environmental protection and the economic well-being of Delta residents.
- Created the Delta Stewardship Council (Council) as an independent state agency to guide actions in the Delta which furthers the coequal goals of Delta restoration and water supply reliability.
- Repealed the CALFED Bay-Delta Authority Act and transfers existing staff, contracts, etc. to the Council.
- Created the Delta Independent Science Board (Science Board) and Delta Science Program.
- Required the State Water Resources Control Board (SWRCB) to develop by August 12, 2010, new flow criteria for the Delta ecosystem necessary to protect public trust resources.
- Required the Department of Fish and Game (DFG), now the Department of Fish and Wildlife (DFW), by December 31, 2010, to develop and recommend to the SWRCB flow criteria and quantifiable biological objectives for aquatic and terrestrial species.
- Created a Delta Watermaster as the enforcement officer for the SWRCB Division of Water Rights in the Delta.
- Required the Council to develop, adopt, and commence implementation of the "Delta Plan" by January 1, 2012, with a report to the Legislature by March 31, 2012.

- Required the DPC to develop a proposal to protect, enhance, and sustain the unique cultural, historical, recreational, agricultural, and economic values of the Delta as an evolving place.
- Required the Delta Plan to further the coequal goals of Delta ecosystem restoration and a reliable water supply.
- Required the Delta Plan to promote statewide water conservation, water use efficiency, and sustainable use of water, as well as improvements to water conveyance/storage and operation of both to achieve the coequal goals.
- Required the Delta Plan to attempt to reduce risks to people, property, and state interests in the Delta by promoting effective emergency preparedness, appropriate land uses, and strategic levee investments.
- Announced a statewide policy to reduce reliance on the Delta in meeting California's future water supply needs through a statewide strategy of investing in improved regional supplies, conservation, and water use efficiency. Each region that depends on water from the Delta watershed shall improve its regional self-reliance for water through investment in water use efficiency, water recycling, advanced water technologies, local and regional water supply projects, and improved regional coordination of local and regional water supply efforts.
- Required the Council to include the Bay Delta Conservation Plan (BDCP) in the Delta Plan and made the BDCP eligible for state funding if:
  - The BDCP complies with Natural Community Conservation Planning Act (NCCPA) and is approved as a Habitat Conservation Plan under the Federal ESA.
  - The BDCP complies with the California Environmental Quality Act and includes a full range of alternatives, including a reasonable range of flow criteria, rates of diversion, and other operational criteria.
  - DWR consults with the Council and Science Board during development of the BDCP.
  - DFW approves the BDCP as a Natural Community Conservation Plan and determines that it meets the requirements for incorporation into the Delta Plan.

SWP Water Quality

The most significant achievement for SWP water quality has been continued definition and advancement of the Delta Improvement Package. Most notably, the Franks Tract studies identified cost-effective ways to achieve significant improvements in the quality of Delta export water.

SWP System Reliability

The completion and filling of DVL marked the most important achievement with respect to protecting Southern California against an SWP system outage. Water deliveries to the reservoir commenced in November 1999, and the lake was filled by early 2003. The lake can hold up to 810 TAF which provides Southern California with emergency water supply, as well as carryover and regulatory storage. As of December 2020, the DVL storage is at 704 TAF.

<u>Inland Feeder</u>

The Inland Feeder is a 44-mile-long conveyance system that connects the SWP to DVL and the CRA. The Inland Feeder provides greater flexibility in managing Metropolitan's major water supplies and allows greater amounts of SWP water to be accepted during wet seasons for storage in DVL. In addition, the Inland Feeder increases the conveyance capacity from the East Branch of the SWP by up to 1,000 cubic feet per second, allowing the East Branch to operate up to its full capacity. The project also improves the quality of the Southland's drinking water by allowing more uniform blending of lower salinity water from the SWP with Colorado River supplies, which have a higher mineral content. Construction of the Inland Feeder was completed in September 2009.

Inland Feeder-Lakeview Pipeline Intertie

The Inland Feeder-Lakeview Pipeline Intertie connects the two conveyance pipelines at the PC-1 control structure on the Inland Feeder. The project allows for delivery of water from Diamond Valley Lake to the Mills Water Treatment Plant. Completed in 2016, the project was a direct response to the extreme drought period in 2014, which saw a 5 percent allocation of Metropolitan's SWP supplies. The intertie enables the Mills Plant to withstand an extended interruption of supplies from the California Aqueduct East Branch. The intertie also provides delivery flexibility to handle any required repairs by DWR to the Santa Ana Valley Pipeline north segment.

3.3 Central Valley/State Water Project Storage and Transfer Programs

Metropolitan endeavors to increase the reliability of supplies received from the California Aqueduct by developing flexible SWP storage and transfer programs. Over the years, Metropolitan has developed numerous voluntary SWP storage and transfer programs to secure additional dry-year water supplies.

Background

Metropolitan has a long history of managing the wide fluctuations of SWP supplies from year to year by forming partnerships with Central Valley agricultural districts along the California Aqueduct, as well as with other Southern California SWP Contractors. These partnerships allow Metropolitan to store its SWP supplies during wetter years for return in future drier years. Some programs also allow Metropolitan to purchase water in drier years for delivery via the California Aqueduct to Metropolitan's service area.

Because yields from individual programs can vary widely depending on hydrologic conditions and CVP/SWP operations, the dry-year yields for the various programs reported in this section are expected values only. In any given year, actual yields could depart from the expected values. Despite that uncertainty, Metropolitan's models of these programs indicate that in the aggregate, they can meet the resource target under a wide range of hydrologic conditions and CVP/SWP operations.

In addition, the SWP storage and transfer programs have served to demonstrate the value of partnering, and, increasingly, Central Valley agricultural interests see partnering with Metropolitan as a sensible business practice beneficial to their local district and regional economy.

Implementation Approach

Metropolitan is currently operating several SWP storage programs that serve to increase the reliability of supplies delivered through the California Aqueduct. Metropolitan pursues SWP water transfers on an as-needed basis. Table 3-3 lists the expected yields from these storage and transfer programs. Figure 3-3 shows the location of Metropolitan's statewide groundwater banking programs.

Storage and Transfer Programs

Semitropic Storage Program

Metropolitan has a groundwater storage program with Semitropic Water Storage District located in the southern part of the San Joaquin Valley. The maximum storage capacity of the program is 350 TAF. The specific amount of water Metropolitan can store in and subsequently expect to receive from the program depends upon hydrologic conditions, any regulatory requirements restricting Metropolitan's ability to export water for storage, and the demands placed on the Semitropic Program by other program participants. In 2014, Metropolitan amended the program to increase the return yield by an additional 13.2 TAF per year. The minimum annual yield available to Metropolitan from the program is currently 34.7 TAF, and the maximum annual yield is 236.2 TAF, depending on the available unused capacity and the SWP allocation. During wet years, Metropolitan has the discretion to use the program to store portions of its SWP water that are in excess of the amounts needed to meet Metropolitan's service area demand. In Semitropic, the water is delivered to district farmers who use the water in lieu of pumping groundwater. During dry years, the district returns Metropolitan's previously stored water to Metropolitan by direct groundwater pump-in return and the exchange of SWP supplies.

Arvin-Edison Storage Program

Metropolitan amended the groundwater storage program with Arvin-Edison Water Storage District in 2008 to include the South Canal Improvement Project. The project increases the reliability of Arvin-Edison returning higher water quality to the California Aqueduct. In addition, Metropolitan and Arvin-Edison often enter into annual operational agreements to optimize program operations in any given year. The program storage capacity is 350 TAF. The specific amount of water Metropolitan can expect to store in and subsequently receive from the program depends upon hydrologic conditions and any regulatory requirements restricting Metropolitan's ability to export water for storage. The storage program is estimated to deliver 75 TAF. During wet years, Metropolitan has the discretion to use the program to store portions of its SWP supplies which are in excess of the amounts needed to meet Metropolitan's service area demand. The water can be either directly recharged into the groundwater basin or delivered to district farmers who use the water in lieu of pumping groundwater. During dry years, the district returns Metropolitan's previously stored water to Metropolitan by direct groundwater pump-in return or by exchange of surface water supplies. In 2015, Metropolitan funded the installation of three new wells at a cost of $3 million that will restore the return reliability by 2.5 TAF per year. The funding will ultimately be recovered through credits against future program costs. As a result of recent detection of 1,2,3-trichloropropane in Arvin-Edison wells, Metropolitan has temporarily suspended operation of the program until the water quality concerns can be further evaluated and managed.

Table 3-3 summarizes Metropolitan's Central Valley/SWP transfer programs supply range for 2035. The supply capabilities shown reflect actual storage program conveyance constraints. In addition, SWP supplies are estimated using DWR's 2019 SWP Delivery Capability Report released in August 2019. Appendix 3 provides a detailed discussion of the current Central Valley and SWP storage and transfers programs and programs that are under development.

Table 3-3
Central Valley/State Water Project Storage and Transfer Programs
Supply Projection
Year 2035
(acre-feet per year)

Hydrology	Five Year Drought (1988-1992)	Single Dry Year (1977)	Normal Year (1922-2017)
Current Programs			
San Gabriel Valley MWD Exchange and Purchase	2,000	2,000	2,000
Central Valley Storage and Transfers			
Semitropic Program	50,000	45,000	68,000
Arvin Edison Program[1]	0	0	0
Mojave Storage Program	0	0	0
Antelope Valley/East Kern Acquisition and Storage	43,000	70,000	70,000
Kern Delta Program	42,000	50,000	50,000
Transfers and Exchanges	50,000	50,000	50,000
Subtotal of Current Programs	***187,000***	***217,000***	***240,000***
Programs Under Development			
San Bernardino Valley Water District Program	0	0	13,000
Subtotal of Proposed Programs	***0***	***0***	***13,000***
Maximum Supply Capability	**187,000**	**217,000**	**253,000**

[1] Take and put amounts limited due to water quality considerations.

San Bernardino Valley MWD Transfer Program

The San Bernardino Valley MWD Transfer Program allows for the purchase of a portion of San Bernardino Valley MWD's SWP supply under surplus conditions. Each calendar year, a determination will be made on how much surplus supplies are available, and Metropolitan will then decide how much will be purchased. The agreement term is until December 31, 2035 and can be extended with a State Water Contract extension.

San Gabriel Valley MWD Exchange Program

The San Gabriel Valley MWD program allows for the exchange of up to 5 TAF each year. For each acre-foot Metropolitan delivers to the City of Sierra Madre, a San Gabriel Valley MWD member agency, San Gabriel Valley MWD provides two acre-feet to Metropolitan in the Main San Gabriel Basin, up to 5 TAF. The program provides increased reliability to Metropolitan by allowing additional water to be delivered to Metropolitan's member agencies Three Valleys MWD and Upper San Gabriel Valley MWD.

Antelope Valley-East Kern Water Agency Exchange and Storage Program

The Antelope Valley-East Kern Water Agency (AVEK) exchange and storage program provides Metropolitan with additional supplies and increased reliability. Under the exchange program, for every two acre-feet Metropolitan receives, Metropolitan returns one acre-foot to AVEK to improve its reliability. The exchange program is expected to deliver 30 TAF over ten years, with 10 TAF available in dry years. Under the program, Metropolitan will also be able to store up to 30 TAF in the AVEK's groundwater basin, with a dry year return capability of 10 TAF.

High Desert Water Bank Program

In December 2019, Metropolitan entered into an agreement with AVEK for the High Desert Water Bank Program to improve water supply reliability during dry years or emergencies and provide greater operational flexibility to balance supplies and demands. Under the Program, Metropolitan will have the ability to store up to 280 TAF of its SWP Table A or other supplies in the Antelope Valley groundwater basin. Metropolitan will provide up to $131 million for the construction of monitoring and production wells, turnouts from the California Aqueduct, underground and aboveground pipelines, recharge basins, water storage, and booster pump facilities. Metropolitan will have first priority to 70 TAF per year of both put and take capacity. The project is anticipated to be in operation by 2024.

Kern-Delta Water District Storage Program

This groundwater storage program has 250 TAF of storage capacity. The program is capable of providing up to 50 TAF of dry-year supply. In 2015, Metropolitan agreed to fund the cross-river pipeline that, when completed, will help improve Metropolitan's return reliability by reducing losses during exchanges. Metropolitan has not incurred any cost to date, as the pipeline has not been constructed. Environmental and regulatory issues have delayed implementation of the pipeline. Water for storage can be either directly recharged into the groundwater basin or delivered to district farmers who use the water in lieu of pumping groundwater. During dry years, the district returns Metropolitan's previously stored water to Metropolitan by direct groundwater pump-in return or by exchange of surface water supplies.

Mojave Storage Program

Metropolitan entered into a groundwater banking and exchange transfer agreement with Mojave Water Agency on October 29, 2003. This agreement was amended in 2011 to extend the term of the program through 2035 and to allow for the cumulative storage of up to 390 TAF. The agreement allows for Metropolitan to store water in an exchange account for later return. Through 2021, Metropolitan can annually withdraw the Mojave Water Agency's SWP contractual amounts in excess of 10%. After 2021, the withdraw rate lowers, reserving 20% of Mojave Water Agency's SWP contractual amounts. Under a 100% allocation, the State Water Contract provides Mojave Water Agency 82.8 TAF of water.

Presently, the Mojave Water Agency is not accepting additional water from Metropolitan. As of January 2021, Metropolitan has approximately 19 TAF remaining in storage. Without additional deliveries to the exchange account, the program may not be able to provide return supplies beyond 2025.

Central Valley Transfer Programs

Metropolitan secures Central Valley water transfer supplies via spot markets and option contracts to meet its service area demands when necessary. Hydrologic and market conditions, and regulatory measures governing Delta pumping plant operations, will determine the amount of water transfer activity occurring in any year. Transfer market activity, described below, provides examples of how Metropolitan has secured water transfer supplies as a resource to fill anticipated supply shortfalls needed to meet Metropolitan's service area demands.

In 2003, Metropolitan secured options to purchase approximately 145 TAF of water from willing sellers in the Sacramento Valley during the irrigation season. These options protected against potential shortages of up to 650 TAF within Metropolitan's service area that might have arisen from a decrease in Colorado River supply or as a result of drier-than-expected hydrologic conditions. Using these options, Metropolitan purchased approximately 125 TAF of water for delivery to the California Aqueduct.

In 2005, Metropolitan, in partnership with seven other State Water Contractors, secured options to purchase approximately 130 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was 113 TAF. Metropolitan also had the right to assume the options of the other State Water Contractors if they chose not to purchase the transfer water. Due to improved hydrologic conditions, Metropolitan and the other State Water Contractors did not exercise these options.

In 2008, Metropolitan, in partnership with seven other State Water Contractors, secured approximately 40 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 27 TAF.

In 2009, Metropolitan, in partnership with 8 other buyers and 21 sellers, participated in a statewide Drought Water Bank, which secured approximately 74 TAF, of which Metropolitan's share was approximately 37 TAF.

In 2010, Metropolitan, in partnership with three other State Water Contractors, secured approximately 100 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 88 TAF. Metropolitan also purchased approximately 18 TAF of water from Central Valley Project Contractors located in the San Joaquin Valley. In addition, Metropolitan entered into an unbalanced exchange agreement that resulted in Metropolitan receiving approximately 37 TAF.

In 2015, Metropolitan, in partnership with eight other State Water Contractors, secured approximately 20 TAF of water from willing sellers in the Sacramento Valley, of which Metropolitan's share was approximately 13 TAF.

In addition, Metropolitan has secured water transfer supplies under the Yuba Accord, which is a long-term transfer agreement. To date, Metropolitan has purchased approximately 200 TAF.

Finally, Metropolitan has secured water transfer supplies under the Multi-Year Water Pool Demonstration Program. In 2013, 2015, and 2016 Metropolitan secured 30 TAF, 1.3 TAF, and 7 TAF respectively.

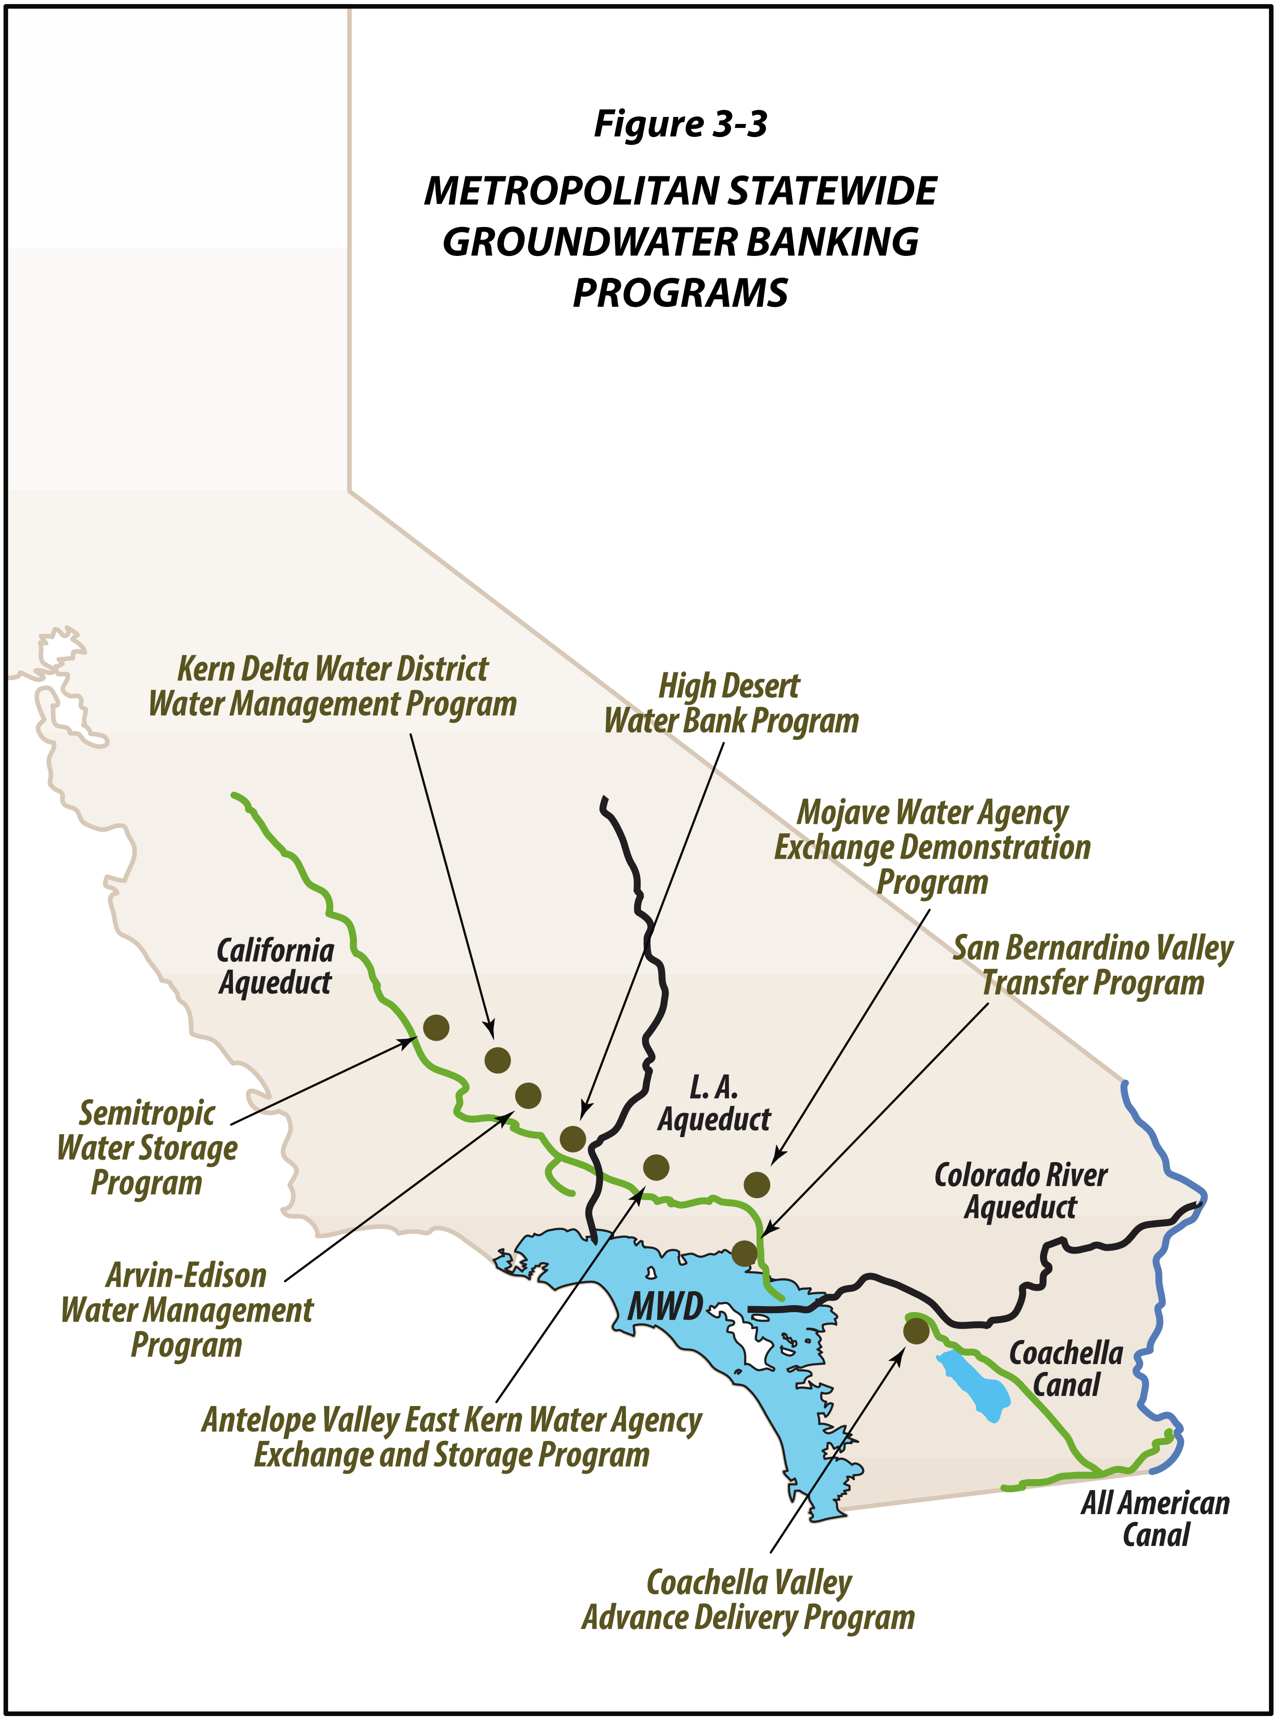
Metropolitan's recent water transfer activities demonstrate Metropolitan's ability to develop and negotiate water transfer agreements either working directly with the agricultural districts who are selling the water or through a statewide Drought Water Bank. Because of the complexity of cross-Delta transfers and the need to optimize the use of both CVP and SWP facilities, DWR and USBR are critical players in the water transfer process, especially when shortage conditions increase the general level of demand for transfers and amplify ecosystem and water quality issues associated with through-Delta conveyance of water. Therefore, Metropolitan views state and federal cooperation to facilitate voluntary, market-based exchanges and sales of water as a critical component of its overall water transfer strategy.

Achievements to Date

Metropolitan has made rapid progress to date developing SWP storage and transfer programs. Most notably, Metropolitan has utilized approximately 122 TAF to supplement its SWP supplies during the recent 2016-2020 period. Of this total, approximately 90 TAF are from SWP storage program extractions in Semitropic, Arvin, Kern Delta, and Mojave; 13 TAF are from the San Gabriel Valley MWD program; and 19 TAF of SWP transfer supplies were purchased from the Yuba water purchase programs.

Figure 3-3

METROPOLITAN STATEWIDE GROUNDWATER BANKING PROGRAMS



3.4 Demand Management and Conservation

Demand management through conservation is a core element of Metropolitan's long-term water management strategy. Metropolitan continues to build on a 30-year investment in conservation of more than $823 million, reflecting a long-term commitment to water conservation. Among other measures, this investment has resulted in the replacement of more than 3.8 million toilets with more water efficient models, rebates of more than 620,000 high-efficiency clothes washers (HECWs), and removal of approximately 195 million square-feet of grass from both commercial and residential properties. Collectively, Metropolitan's conservation programs and other conservation in the region will reduce Southern California's reliance on delivery of imported water by almost 1.2 MAF per year by 2030.

Metropolitan's continued approach to conservation has put its service area on target to achieve California's 20x2020 Water Conservation Plan per capita goal of less than 145 gallons per capita per day (GPCD). Continuous conservation messaging, along with active conservation programs, have contributed to Metropolitan maintaining its water demand to sustainable levels, while also meeting its regional target.

Background

Metropolitan's conservation policies and programs are designed to maintain a sustainable water demand level and meet the conservation savings target adopted in the IRP. These policies and programs directly relate to the demand management measures for wholesale water agencies in the Urban Water Management Planning Act.

Water conservation savings result from active, code-based, and price-effect conservation efforts. Active conservation consists of water-agency funded programs such as rebates and incentives for water efficient fixtures and equipment and turf removal. Code-based and price-based conservation consists of demand reductions attributable to conservation-oriented plumbing codes and usage reductions resulting from increases in the price of water. Metropolitan does not currently assign a savings value for public awareness campaigns and conservation education because any initial effect on demand reduction and the longevity of the effect are difficult to measure. It is generally accepted that these outreach programs prompt consumers to install water saving fixtures and change water-use behavior, thereby creating a residual benefit of increasing the effectiveness of complementary conservation programs.

Distinguishing between active, code-based, and price-effect conservation can be analytically complex when, for example, active programs for fixtures are concurrent with conservation-related plumbing codes. Metropolitan uses specially designed estimating models to quantify and project conservation savings. This plan combines active, code-based, and price-effect conservation savings using methods that avoid double counting.

Conservation savings are commonly estimated from a base-year water-use profile. Metropolitan uses 1980 as the base year because it marked the effective date of a new plumbing code in California requiring toilets in new construction to be rated at 3.5 gallons per flush or less. Between 1980 and 1990, the region saved an estimated 250 TAF per year as the result of this 1980 plumbing code and unrelated water rate increases. These savings are referred to as "pre-1990 savings." Metropolitan's resource planning target combines pre-1990 savings and estimates of more recently achieved savings.

Including regional pre-1990 conservation savings, Metropolitan anticipates savings of 1.19 MAF by 2030. A large share of the savings has already been achieved through existing Metropolitan and member agency programs, pre-1990 savings, price-effects, and continued savings that accrue from plumbing codes. The remainder is expected to be achieved through additional agency-sponsored active conservation programs, code changes, and price-effects.

Implementation Approach

Metropolitan's approach to achieving the conservation target depends on implementing a suite of demand management measures, including public education and outreach, a variety of conservation programs, metering, research and development, and asset management. These programs include cost-effective active conservation programs and new, innovative programs that address regional water uses. Metropolitan also provides support to member agencies for local programs that assist with implementing local conservation programs while reducing per capita water use. Metropolitan continues to seek state and federal grant funding for conservation in coordination with its member agencies.

As the California Urban Water Conservation Council (CUWCC) disbanded, Metropolitan worked with other California water agencies to form the California Water Efficiency Partnership (CALWEP). CALWEP's mission is to maximize urban water efficiency and conservation throughout California by supporting and integrating innovative technologies and practices; encouraging effective public policies; advancing research, training, and public education; and building collaborative approaches and partnerships. Metropolitan is an active participant on the CALWEP Board, the Program Committee, and Research Committee.

Metropolitan also participates in national water efficiency efforts. Metropolitan is a USEPA WaterSense partner, helping to promote water efficient products and practices in Southern California. Metropolitan is also a member of the Alliance for Water Efficiency, participating on its Board and in the committees on research, WaterSense and water efficient products, and education and outreach.

The following sections describe Metropolitan's demand management measures and conservation programs, including education and outreach.

Public Education and Outreach

Since 1983, Metropolitan's Education Unit has provided award-winning water education programs, supplemental materials, teacher in-services and classroom presentations for K-12 teachers and students in Southern California. Since that time, materials and outreach programs have expanded to the pre-K and college education levels. In 2015, Metropolitan implemented an education strategic plan which sought to:

1. Expand working programs
2. Develop an "Educational Pipeline" to jobs in the water industry
3. Leverage collaborations
4. Invest in educational technology

These initiatives, as well as Metropolitan's curricula and materials, have impacted a generation of students, expanded their understanding of California's water supply and distribution systems, water sources, water use and conservation, the science of water, public policies, and the importance and responsibility of stewardship. All Metropolitan programs correlate to California Content Standards including Common Core and Next Generation Science Standards (NGSS). These programs are continually evaluated for effectiveness and improved upon. Metropolitan's most recent online education programs are summarized in Table 3-4.

Public Education Programs

Metropolitan has continued to update and expand its comprehensive K-12 water education curriculum that meets all California education standards for each grade level in the areas of science, math, language arts and social studies classroom materials. Metropolitan worked with its member agencies to annually hold more than 700 outreach events which directly interact with more than 170,000 students, teachers, parents, and participants through its water education programs, curricular materials, and engagements. More than 12,000 public visitors and students annually tour the Diamond Valley Lake Visitor Center to learn more about Metropolitan's water systems and programs. These efforts led to Metropolitan's Education Unit being awarded the 2015 Governor's Environmental and Economic Leadership Award (GEELA), California's highest environmental honor.

In 2015, Metropolitan redesigned its museum-quality exhibit at the Vista del Lago visitor's center at Pyramid Lake, part of the State Water Project.

Throughout 2016, Metropolitan worked to develop virtual reality tours of the Colorado River Aqueduct and augmented reality watershed exhibits to encourage students to think critically about water issues in Southern California. This work led to a collaboration with the Department of Water Resources to create a virtual reality tour of the State Water Project which received first-place recognition from the National Association of Government Communicators.

In 2017, Solar Cup, the nation's largest high school solar boat race, celebrated its 15-year anniversary. This program engages 40 teams and more than 750 high school students annually in STEAM (science, technology, engineering, art and math) topics associated with water stewardship and renewable energy.

In 2018, Metropolitan's "Water is Life" Student Art Exhibit and Calendar celebrated its 30-year anniversary. This program annually compiles more than 12,000 pieces of art generated by K-12 students throughout Metropolitan's service area.

In 2019, Metropolitan's World Water College Grant Program increased solicited proposals from $10,000 to $20,000 grants to conduct research and development on improving water quality, environmental science of watersheds, and the implementation of water-use efficiency technologies. Since 2004, Metropolitan's World Water College Grant Program has disbursed approximately $800,000 in grants to 26 colleges, benefitting more than 800 students.

Outreach

Since late 2013, the primary focus of Metropolitan's conservation and education outreach programs has been on the drought response and the need for additional conservation in order to maintain the region's water supply reserves. That message has evolved to emphasize conservation and stewardship as a sustainable way of life, rather than only a response to dry conditions.

Each year, Metropolitan implements a variety of conservation and education outreach programs. The "Let's All Take a Turn" campaign launched July 1, 2015 and continued in 2016, but added additional messaging around a new trademarked logo of H2Love, and the tagline, "Love Water. Save Water." This message emphasized the value of water conservation not only during the drought, but every day. Working with Metropolitan's 26 member agencies, the research-based advertising campaign includes several months of media coverage through radio live reads, 53 community newspapers, digital and online advertising, other customized materials and special outreach events throughout Southern California. The entire campaign was produced in five languages: English, Spanish, Mandarin, Korean, and Vietnamese, and Print advertising included Tagalog language materials.

The campaign's design was informed by extensive research through focus groups, telephone interviews, and web surveys conducted in two languages throughout Metropolitan's service area. The media strategy was developed to effectively target the diverse communities, age groups, socioeconomic factors, and languages spoken in the region. The "Let's All Take A Turn" campaign supplements Metropolitan's strong program of outreach activities, social and traditional media, and business outreach efforts to spread the word to residents, businesses, community leaders and elected officials about the importance of water conservation.

A new component of the conservation campaign was an official sponsorship with Major League Soccer's LA Galaxy. This partnership provided digital signage at the StubHub Center in Carson, water-awareness exhibit booths at four home games, public service announcements and social media videos featuring LA Galaxy goalie Brian Rowe, cross-promotion of water-saving messages on Metropolitan and LA Galaxy social media platforms, Facebook Live events with actor Johnny Rey Diaz, and outreach activities with the LA Galaxy community foundation organization.

As part of the campaign, Metropolitan also conducted several television interviews and placed a series of advertorial news stories in the online editions of the Los Angeles Times and Nativo for added value news stories. Metropolitan placed advertorials on digital media focusing on the seriousness of the drought, what people can do to save water, and offering landscape and gardening advice including a Facebook Live broadcast by Sunset Magazine which was viewed by more than 7,000 people. In addition, Metropolitan used social and digital media to reach large audiences in cost effective and optimized strategies, including setting up playlists on Pandora and its Spanish-language equivalent, Uforia. The playlists promote shorter showers by listening to five-minute-long songs about water or rain. These elements promoted the ongoing need for conservation in Southern California, describing long-term benefits of investments in water storage and local water resources, and the availability of rebates and incentives for turf removal and water-saving devices and appliances.

The H2Love advertising campaign continued to support sustainable, lifelong water conservation. The campaign included digital ads, billboards, bus wraps and transit shelters, as well as a continued partnership with the Major League Soccer's LA Galaxy, its own Pandora song list, and a takeover of the Santa Monica Pier Ferris wheel.

Metropolitan's online conservation portal, bewaterwise.com®, was redesigned with a more user- and mobile-friendly navigation and translated into Chinese and Spanish. A Garden of the Month video series was launched on bewaterwise.com® and multiple social media platforms featuring California Friendly® inspiration gardens.

Metropolitan's multilingual H2Love campaign concluded in spring 2018 with a successful 12-week media strategy featuring outdoor billboards, radio ads, community newspapers and a sponsorship with Major League Soccer's LA Galaxy. With nearly two billion media impressions delivered and a toolkit of informational resources and files, the campaign successfully reached its target audiences as demonstrated in a post-campaign public survey. Outreach efforts increased traffic to the district's bewaterwise.com® conservation website by more than 300 percent, and social media growth in views increased more than one-hundred-fold.

While social media and search engine optimization maintained message consistency and visibility, Metropolitan initiated a request for proposal process for a new three-year water conservation outreach media campaign. Metropolitan's Board of Directors awarded a \$14.7 million contract to the Los Angeles-based firm Quigley-Simpson & Heppelwhite, which produced Metropolitan's award-winning Take a Turn and H2Love campaigns. The new "Save

Water 365" campaign launched in July 2018. The campaign encouraged Southern Californians to save water every day. It also reminded residents to take advantage of rebate programs – including incentives for indoor and outdoor water-saving devices, as well as rebates for landscape transformation that requires more efficient irrigation systems, design and plants. The campaign also reached very diverse audiences in English, Spanish, Mandarin, Korean, Vietnamese, and Tagalog through traditional and grassroots marketing efforts. Creative messaging included signs on food trucks, local convenience and hardware stores, and a sponsorship with the LA Dodgers.

The "Save Water 365" campaign delivered more than 1 billion media impressions. Working with Metropolitan's 26 member agencies, the research-based advertising campaign included:

- Digital and online advertising
- Total of 1,475 billboards and television commercials
- Radio messages on more than 50 stations
- Animated digital ads with general rebate and landscape transformation program messaging
- Print ads in community newspapers
- English and Spanish language Pandora radio stations and other customized materials and special outreach events throughout Southern California

The campaign also included a grass-roots outreach effort in multiple languages through advertising at convenience and hardware stores and on food trucks, as well as a presence on a popular Chinese game show. The media strategy was designed to effectively target diverse communities, age groups, socioeconomic factors and languages spoken in the region.

In August 2018, Metropolitan began an official sponsorship with Major League Baseball's Los Angeles Dodgers. This sponsorship included a title night event before more than 40,000 fans featuring former Metropolitan Board Chairman Randy Record throwing the opening pitch. The evening highlighted a Dodger groundskeeper and the many ways in which the Dodger organization conserves water. Public service announcements were displayed on LED boards throughout the stadium, as well as cross promotions on conservation on Metropolitan's and the Dodgers' social media platforms.

Growth in social media activity was dramatic. In 2018, Metropolitan's Facebook page received more than 55 million impressions, with more than 27,000 followers. On Twitter, Metropolitan received strong engagement for its water efficiency posts, including short videos and animated gifs to reach a broader audience during its conservation campaign and for Delta Conveyance initiatives. Metropolitan used Facebook Live and Snapchat geo-filters to reach a broader audience throughout 2017-18.

The success of Metropolitan's outreach activities was recognized with several prestigious awards including the best in show for the National Association of Government Communicators in 2018. This organization is a national association of communication officials from local, state and federal public agencies. Metropolitan was a finalist in 13 of 40 award categories.

In April 2019, the general conservation message of the "Save Water 365" campaign became more targeted and focused on promoting the incentive under Metropolitan's revamped turf replacement program. The incentive provides Southern Californians $2 for every square-foot of grass replaced with more water efficient sustainable landscaping. The campaign continued to reach diverse audiences on multi-media platforms: digital billboards featured in shopping malls, grocery stores and movie theaters encouraged residents to "ditch their grass and claim their rebate." Radio spots promoting the "ditch your grass" message in English and Spanish were featured on nearly 40 radio stations, and creative digital display ads generated nearly 120 million impressions on digital media and nearly 300,000 ad clicks.

Local community outreach also played an important role in this campaign through strengthened partnerships between Metropolitan and its member agencies. Turf Replacement Program advertisements in English, Spanish, and Chinese ran in 25 publications from May to June 2019, and together, these advertisements reached 1.7 million readers across the district's area.

Metropolitan also partnered with Los Angeles- and San Diego-based news shows to develop water conservation programming in English and Spanish. On-air talent spoke about the benefits of replacing your lawn with California Friendly® and native landscaping and promoted Metropolitan's turf rebate.

In fall 2019, Metropolitan launched a multilingual digital campaign that continued to promote the turf rebate incentive. Digital display banners on home improvement and lifestyle websites encouraged viewers to save money by converting their lawns to sustainable landscapes. Together with search advertising, these display ads generated 151 million impressions and thousands of turf rebate applications. The Hispanic market saw a significant increase in online engagement and drove the most landing page visits with 200k link clicks. Part of the fall campaign's communications strategy was to collaborate with Los Angeles- and San Diego-based news shows to develop water conservation programming in English and Spanish. On-air talent spoke about the benefits of replacing your lawn with California Friendly® and native landscaping and promoted Metropolitan's turf rebate.

To supplement digital outreach, Metropolitan partnered with Los Angeles Dodgers, Angels, Rams, Chargers, Lakers, Clippers and Kings sports organizations to promote advertisements with water use efficiency messaging. The ads appeared in game-day programs and annual yearbooks, reaching millions of fans across Southern California. These creative assets also received more than half a million impressions on Metropolitan's social media channels.

Additionally, Metropolitan initiated in-house design and advertising campaigns to reach new online demographics. Staff designed an award-winning social media campaign called Patch Match in the format of a dating app that 'matches' consumers with the perfect California Friendly® plants and promotes water conservation. The social media campaign was significantly more efficient than other digital and online advertising, reaching more than 200,000 people with nearly 400,000 impressions, resulting in nearly 3,000 page views to bewaterwise.com. The National Association of Government Communicators honored Patch Match with a first-place award in the social media category.

In late 2019, staff brought their creative concepts to fruition with the "Wasting Water Is…" campaign. This three-part digital commercial series was produced entirely in-house and featured scenarios where water wasters learn how scary, tragic and offensive wasting water really is. Production costs for all three commercials totaled less than $50,000 compared to typical advertising agency costs of $300,000 to $500,000 per video. Movie posters and animated GIFs promoted on Metropolitan social media channels resulted in more than 5.5 million impressions with more than 79,000 link clicks. Staff also advertised the videos on YouTube and connected TV devices such as Apple TV, Chromecast and Roku, targeting entertainment, lifestyle and sports themed content that outperformed targeted goals at an average 44 percent view through rate.

Throughout these years, Metropolitan officials conducted hundreds of interviews with news reporters from major TV and print media outlets, ethnic media and community publications to discuss a wide range of water-related issues. Topics included the effect of climate change and drought on Colorado River resources, water supply reliability and conservation, and raising awareness about Metropolitan's new turf replacement program. As part of this public outreach, Metropolitan's General Manager Jeffrey Kightlinger blogged on Metropolitan's webpage mwdh2o.com and wrote guest blogs and op-eds encouraging conservation in 2019. Metropolitan continues to provide outreach to Southern California's businesses and industry.

Metropolitan is an active member in many chambers of commerce and other business organizations and provides regular updates to members on water policy issues and programs. Water use efficiency programs that help reduce demand for potable water are a key focus of these partnerships. In addition, Metropolitan hosts hundreds of community and business leaders on inspection trips of the State Water Project and Colorado River Aqueduct to help them better understand the challenges of providing reliable water to Southern California and how the Colorado River is managed to provide water for urban areas and agriculture.

Community Partnering Program

Over the past five fiscal years, Metropolitan has engaged in approximately 270 sponsorship programs and projects through its Community Partnering Program. Investments totaling $540,000 were provided to non-profit organizations, member agencies, other public resource agencies and educational institutions for programs including California native plant gardens and outdoor classrooms, Earth day events, water quality laboratory test kits, and multi-lingual educational publications addressing conservation, water-use efficiency, recycling, watersheds and more regional issues.

California Friendly Landscape Education and Training Program

Metropolitan provides education and training on ways to conserve water in homes and landscapes. Offerings include in-person and online classes, surveys, and audits.

Landscape Classes

Metropolitan offers in-person and online courses in irrigation efficiency and water-wise garden design through its California Friendly Landscape and Native Plant Training Program. Metropolitan also offers Turf Removal Classes. In FY 2019-20 Metropolitan conducted 45 classes for 1,200 students throughout Metropolitan's service area. After COVID-19 forced the temporary cancellation of in-person classes, Metropolitan created online Zoom courses with its vendors to continue offering Southern California residents valuable water saving landscape education.

Landscape Irrigation Surveys

Metropolitan provides irrigation surveys for large landscape customers. These surveys are performed by a certified Landscape Irrigation Auditor and provide the customer with specific recommendations on how to improve irrigation efficiency at the site. The survey report generated by the auditor also provides information on incentives to help the customer fund the needed improvements. In fiscal year 2019-20, 21 surveys were conducted.

Irrigation Evaluations and Residential Surveys

Metropolitan provides funding to its member agencies that choose to implement irrigation evaluations and indoor surveys for residents. Irrigation evaluations provide customers with a recommended irrigation schedule and suggested improvements for irrigation systems. Indoor residential surveys provide customers with information on identifying leaks and making changes to water-using devices in the home.

Water Conservation Programs

Metropolitan's water conservation programs focus on two main areas: (1) residential water use, and (2) commercial, industrial, and institutional water use. Metropolitan directly manages regional programs and provides financial support for local programs that are implemented by the member agencies. Metropolitan's Water Use Efficiency team provides program development, implementation, administration, monitoring, evaluation, and research.

Metropolitan's Conservation Credits Program (CCP) provides the basis for financial incentives and funding for the conservation programs and other demand management related activities. Established in 1988, this funding mechanism supports Metropolitan's commitment to conservation as a long-term water management strategy.

The basis of Metropolitan's financial support to member agency conservation efforts is estimated at $195 per acre-foot of water saved up to the device cost. In general, CCP-funded water conservation project proposals must:

- Have demonstrable water savings;
- Reduce water demands on Metropolitan's system; and
- Be technically sound and require Metropolitan's participation to make the project financially and economically feasible.

Metropolitan introduced two new funding options for member agency conservation efforts. Member agencies may use a portion of their funding for projects that provide value to the region, but the water savings may be difficult to measure. In addition, member agencies can use funding to target disadvantaged communities.

Table 3-5 summarizes CCP savings and investments. Additional funding for conservation programs has been made available through federal and state government agencies. Metropolitan has worked to obtain a share of this funding to enhance the region's water conservation investments. Table 3-6 describes past sources and uses of these funds.

Table 3-7 summarizes the types and numbers of efficient devices that have been installed through Metropolitan's conservation programs since they began in fiscal year 1990-91.

Regional Conservation Programs

As mentioned above, Metropolitan's conservation programs focus on two main sectors: (1) residential water use, and (2) commercial, industrial and institutional water use.

Residential Programs

Metropolitan's residential conservation activities consist of two major programs:

- SoCal Water$mart – Metropolitan provides a region-wide residential rebate program named SoCal Water$mart. Since its inception in 2008, rebate activity has increased dramatically as many residential customers became increasingly aware of the financial incentives available to them to help offset the purchase of water-efficient devices. To date, this program helped to replace over 277,000 toilets, 319,000 washing machines, 50,000 smart irrigation controllers, 459,000 rotating nozzles, and hundreds of thousands of other devices and appliances.
- Metropolitan-Funded Residential Programs Administered by Member Agencies – Metropolitan's member and retail agencies also implement local residential water conservation programs within their respective service areas and receive Metropolitan incentives for qualified retrofits and other water-saving actions. Typical projects include

premium high-efficiency toilet (HET) distributions, locally administered clothes washer direct-installation programs, turf removal programs, and residential water audits.

Residential Rebate Items

Metropolitan provides incentives on a variety of water efficient devices for the residential sector. The following is a brief description of current and past devices that contribute to projected conservation savings:

- Turf Removal (Residential) – About 50 percent of residential household water demand is used for outside irrigation where opportunities to conserve water are substantial. Southern California residents have turned the turf removal program into Metropolitan's most popular conservation measure. To encourage market transformation, Metropolitan has paid over $198 million in the regional turf removal program for residential properties since program inception.
- High-Efficiency Clothes Washers – HECWs continue to be a major component of indoor water conservation. The water efficiency of clothes washers is represented by the "integrated water factor," which is a measure of the amount of water used to wash a standard load of laundry. Washers with a lower integrated water factor will save more water per wash cycle. Metropolitan has continued to move the water conservation rebate standards by requiring lower integrated water factors for eligible washers. The program eligibility requirement is currently set at an integrated water factor 3.2, which saves over 10,700 gallons per year per washer over a conventional top loading washer. Metropolitan has also partnered with Southern California Gas on a direct-installation program for high-efficiency clothes washers in low-income households.
- High-Efficiency Toilets – Metropolitan has provided incentives for water efficient toilets since 1988. Metropolitan changed its rebate program to provide funding for toilets that flush at 1.1 gallons or less. Metropolitan uses the Maximum Performance of Premium Toilet Models testing list to distinguish qualifying models.
- High Efficiency Sprinkler Nozzles – Pop-up, high efficiency spray heads provide significant outdoor water savings over conventional nozzles. Field tests and studies have demonstrated these nozzles apply water more evenly than traditional nozzles with fixed fan spray patterns, creating the potential for water savings. Low precipitation rates associated with these nozzles can also reduce run-off, thereby offering a significant value-added benefit when irrigating sloping landscapes.
- Irrigation Controllers – Smart irrigation controllers and soil moisture sensors adjust irrigation schedules based on water needs, temperature, sunlight, soil moisture, soil conditions, plant types, slope or some combination of indicators. Metropolitan uses the USEPA WaterSense list for eligible controllers.

Commercial, Industrial and Institutional Programs

Metropolitan's commercial industrial and institutional (CII) conservation consists of three major rebate and incentive programs:

- SoCal Water$mart Program – The majority of the commercial conservation activity comes from Metropolitan's regional SoCal Water$mart program, which also issues rebates to multi-family properties.
- Water Savings Incentive Program – The Water Savings Incentive Program provides financial incentives for customized landscape irrigation and industrial process improvements. This program allows large-scale water users to create their own conservation projects and receive

incentives for up to 10 years of water savings for measured water-use efficiency improvements.

- Metropolitan-Funded Commercial Programs Administered by Member Agencies – Member and retail agencies also implement local commercial water conservation programs using Metropolitan incentives. Projects target specific commercial sectors, with some programs also receiving assistance from state or federal grant programs. Metropolitan incentives are also used as the basis for meeting cost-share requirements for the grants.

Commercial Rebate Items

Metropolitan's CII programs provide rebates for water-saving plumbing fixtures, landscaping equipment, food-service equipment, cleaning equipment, HVAC (heating, ventilation, air conditioning) equipment, and medical equipment.

- Turf Removal (Commercial) – Similar to the residential sector, water demand for landscape irrigation on commercial, industrial, and institutional properties is significant. Opportunities to conserve water are substantial, particularly in areas with ornamental turf. With an increased incentive rate ($2 per square foot of turf removed), approximately 92 million square feet of grass has been removed from commercial, industrial, and institutional properties since program inception through the regional rebate program, and member agency turf programs. To encourage market transformation, Metropolitan has paid over $138 million for the regional turf removal program for commercial properties since inception.
- Commercial Devices – Following is a list of current and past devices that contribute to projected conservation savings:
  - Connectionless Food Steamers
  - Cooling Tower Conductivity Meters
  - Dry Vacuum Pumps
  - High-Efficiency Clothes Washers
  - High-Efficiency Toilets
  - High-Efficiency Urinals
  - Ice Machines
  - In-Stem Flow Regulators
  - Large Rotors - High Efficiency Nozzles
  - Laminar Flow Restrictors
  - High Efficiency Nozzles
  - pH Cooling Tower Controllers
  - Plumbing Flow Control Valves
  - Premium High Efficiency Toilets
  - Pre-rinse Spray Heads
  - Soil Moisture Sensors
  - Steam Sterilizers
  - Ultra-Low-Flush Toilets
  - Ultra-Low-Flush Urinals
  - Water Brooms
  - Weather-Based Irrigation Controllers
  - X-ray Processors
  - Zero/Ultra Low Water Urinals

Disadvantaged Communities Program Initiative

Metropolitan initiated an effort to increase water efficiency within disadvantaged communities (DACs) in Metropolitan's service area through the Disadvantaged Communities Program. This program has been executed in three parts. First, a Regional Pilot Program for Multi Family/Apartments Pre-1994 offering an enhanced incentive for Premium High-Efficiency Toilets, targeting pre-1994 structures for retrofits combined with rigorous data collection and analysis. Part two is an effort to help Metropolitan's member agencies implement local DAC projects by providing intensive member agency local support and technical assistance with program design and administration. And finally, Metropolitan looks for grant support to fund regional and local DAC projects.

Metering

Metropolitan's water distribution system is metered. Metropolitan has over 400 service connections that meter water deliveries to our member agencies. Meters at these service connections are checked every six months or sooner to verify that they are measuring correctly. More extensive maintenance is done on a yearly basis to ensure the meter systems continue to operate reliably.

Research and Development Programs

Metropolitan is committed to conservation research as a way to advance technology, improve program results, and help transform markets. Self-funded studies include determining water savings from municipal leak detection programs, effectiveness of single-family home pressure relief valves on lowering water demand, quantifying residential water use and water fixture inventory, and analyzing savings attributed from landscape irrigation system improvements.

Metropolitan's Innovative Conservation Program (ICP) is a competitive grant program that evaluates water savings and reliability of new water saving devices, technologies, and strategies. With funding provided by USBR, Southern Nevada Water Authority, Central Arizona Project, Southern California Gas, Western Resource Advocates, and Metropolitan, approximately $570,000 of funding was available for research for the 2018 ICP. After evaluating over 60 project proposals, twelve were selected. The projects focused on landscape, commercial, industrial, and residential water use applications. The next round of grants will be implemented in fiscal year 2021.

Metropolitan has partnered with the Alliance for Water Efficiency (AWE) for water conservation research. The current research project involves exploring the water efficiency potential of cooling towers through process improvements and operational management. Past projects have included: lessons learned through a drought management study of Australia, a water neutral development ordinance, a study on commercial kitchen efficiency, a study on outdoor impacts of the drought, and reasons and rationale for landscape choices.

Measurement and Evaluation

Measurement and evaluation are important components of Metropolitan's conservation programs. These serve four primary functions:

- Providing a means to measure and evaluate the effectiveness of current and potential conservation programs
- Developing reliable estimates of various conservation programs and assessing the relative benefits and costs of these interventions
- Providing technical assistance and support to member agencies in the areas of research methods, statistics, and program evaluation
- Documenting the results and the effectiveness of Metropolitan-assisted conservation efforts

Metropolitan's staff has served as technical advisors for a number of state and national studies involving the quantification and valuation of water savings.

Recognition for Conservation Achievements

Conservation is an integral part of water supply planning at Metropolitan. Metropolitan works to improve the understanding of the costs and benefits of conservation so investment decisions are both efficient and effective at meeting program goals. As a cooperative member of California's water conservation community, Metropolitan has made significant contributions to the development and coordination of conservation activities throughout the state. These contributions have been recognized in the form of "Gold Star" certification from the Association of California Water Agencies and awards from the USBR and California Municipal Utilities Association.

Table 3-4
Online School Education Programs

Online Education Offerings	Grades	Notes
Water Journeys	Grades 4 – College	In partnership with Los Angeles County Sanitation Districts, Water Journeys begins with a presentation on water awareness, aqueducts, conservation and recycling followed by a walking tour of the Regional Recycled Water Purification Center.
DVL Online Fieldtrip	Grades 4-8	Diamond Valley Lake, the largest reservoir in Southern California, located in Riverside County near Hemet. Students experience a variety of standards-based, water-related, hands-on science activities.
Girl Scout Programs	K - 12 Daisies, Brownies & Juniors, Cadettes, Seniors and Ambassadors	Metropolitan is offering a FREE online patch program about Southern California's water sources and conveyance systems.
Scout Programs	K - 12	Metropolitan is offering a FREE online patch program about Southern California's water sources and conveyance systems aligned with Environmental Science Merit Badge Requirements
On-line class presentations	PreK - College	Metropolitan staff will create a customized water-education presentation or "H2O Show" for students from pre-K to college.
Online Story Time	PreK – 3rd	Bring story times to life with our engaging educators and colorful stories about water.
All About Water Curriculum	K - 2nd	New video experiments and interdisciplinary activities about water conservation, water quality and distribution, the water cycle, and fresh and saltwater.
VR Trip SWP	Grades 4 – College	Immerse your students in the State Water Project system and discover the 444-mile journey that water makes to Southern California. Students will virtually visit the Bay Delta, Banks Pumping Plant, the California Aqueduct, Chrisman Pumping Plant, and Lake Perris.
VR Trip CRA	Grades 4 – College	Follow the journey of water to Southern California via Metropolitan's Colorado River Aqueduct. The tour is available as a virtual reality app for Apple and Android mobile devices.

Table 3-5
Metropolitan's Conservation Credits Program

Fiscal Year	Annual Water Savings (AF)	Lifetime Water Savings (AF)	Investment
2019 – 2020	212,000	55,719	$25.7 million
2018 – 2019	208,000	55,263	$16.4 million
2017 – 2018	213,000	82,435	$12.6 million
2016 - 2017	206,000	137,065	$41.4 million
2015 - 2016	203,000	731,093	$229 million

Table 3-6
Grant Program Funding

Funding Source	Program/Project	Funding Amount ($1,000s)	Description	Status
CALFED				
	Residential HECW	$925	Increase rebate amount	Completed
	Protector del Agua	$100	Course development	Completed

Asset Management Program

In compliance with California Water Code § 10631(e)(2), below is a description of Metropolitan's distribution system asset management program.

Metropolitan's approach to asset management is contained within its Infrastructure Reliability Strategy. The goal of Metropolitan's Infrastructure Reliability Strategy is to ensure long-term reliable performance of the system in an efficient and cost-effective manner. Infrastructure reliability is addressed through three programs: the Maintenance Management Program, the Infrastructure Protection Plan, and the Dam Safety Program. The activities performed under these programs allow for Metropolitan to extend the life span of its facilities and equipment and improve the overall reliability of the entire conveyance, treatment, and distribution system. Metropolitan is also completing a Strategic Asset Management Plan that will further expand the use of asset data for improved planning, maximizing the value of infrastructure assets and enhancing the longer-term visibility for its Capital Investment Plan.

Maintenance Management Program

Metropolitan manages the maintenance on approximately 135,000 pieces of equipment located at its five treatment plants, sixteen hydro-electric power plants, five desert pumping plants, 242 miles of canals, and over 5,000 structures on 830 miles of pipeline.

Computerized Maintenance Management System**:** A Computerized Maintenance Management System (CMMS) is used to track, plan, and schedule the required activities. The system currently has over 28,000 preventative maintenance cycles scheduled with approximately 96 percent of these performed at fixed intervals (Time Based). The remaining four percent are performed based on the condition or use of the equipment (Condition Based).

Routine Maintenance, Inspection, and Monitoring

Monitoring, inspection, and maintenance of equipment and facilities are a proactive effort to assess the overall condition of the assets. This effort encompasses identifying needed repairs and performing routine maintenance.

Time-Based Maintenance

Metropolitan currently uses time-based maintenance as the primary means of maintaining equipment reliability. Time-based maintenance for equipment is set at specific time intervals using manufacturer recommendations. These recommendations are used to develop Job Plans in the CMMS which detail the individual steps required for a particular maintenance operation.

Condition-Based Maintenance

Condition-based maintenance (CBM) relies on an understanding of how a piece of equipment degrades or fails to meet its intended function. It requires a greater depth of understanding of the manufacturer's recommended maintenance, industry standards, or practices. This knowledge is used in conjunction with field experience to develop a technique to gauge the equipment's condition. Through trending or analysis, a determination can then be made as to when the equipment may reach a point where corrective maintenance will be required including rehabilitation or replacement. A regular inspection cycle is set in the CMMS software to evaluate current equipment condition. High and low condition alarms are also set that trigger a corrective maintenance activity when equipment is starting to degrade or its use has reached a servicing checkpoint.

Predictive maintenance is a subcategory of CBM that uses diagnostic equipment or testing to determine the equipment condition. Predictive maintenance is also used to detect impending problems before the equipment malfunctions. In some cases, Metropolitan has automated the inspections such as through online vibration monitoring systems that trend the performance of critical and large equipment. A fundamental characteristic of this type of maintenance is that it provides the capability to anticipate potential problems while the equipment is still operating. This provides several key benefits when compared to time-based maintenance or allowing equipment to reach a point where corrective maintenance is required. These benefits include: improved availability or uptime, enhanced reliability, and reduced cost.

Corrective Maintenance

Corrective maintenance is performed on equipment that either has already failed or has had a problem detected during routine (time or condition based) maintenance. Corrective maintenance needs to be scheduled, requires replacing equipment components, or involves a shutdown of the impacted system. Corrective maintenance is also tracked, planned, and scheduled in the CMMS.

Major Scheduled Outages/Shutdowns

In addition to the general maintenance described above, Metropolitan may take major systems out of service, such as water treatment plants, large pipelines, conveyance systems, or other large facilities, typically for periods of seven to twenty-one days. This is done to perform major maintenance or repairs on several components or systems, upgrade or add new processes, or perform other important work.

Reports and Metrics

Metropolitan produces internal reports that track maintenance management activities including overall backlog and past due work orders (including any missed regulatory preventive maintenance). In addition, other CMMS reports are available that provide managers, planners/schedulers, and maintenance staff with the data needed to evaluate and track work.

Metropolitan utilizes best management practices and performance metrics from the Society of Maintenance & Reliability Professionals to ensure a reliable and cost-effective maintenance management program.

Infrastructure Protection Plan

Activities under the Infrastructure Protection Plan ensure long-term infrastructure reliability by conducting special condition assessments and vulnerability assessments of Metropolitan's facilities.

Special Condition Assessments

Special Condition Assessments are extensive inspections, investigations, and evaluations of Metropolitan facilities and equipment that go beyond routine maintenance and monitoring activities. The assessments are conducted to identify needed rehabilitation and replacement projects which can lead to long-term reliability programs. These assessments include: inspections of facilities during shutdowns when the facility may otherwise be non-accessible, investigations of systemic issues, and evaluations of Metropolitan's ability to maintain deliveries in the event of an unplanned facility outage or loss of water supply.

Special Condition Assessments may be initiated through requests from Water Systems Operations, in response to a specific event or concern within Metropolitan's system, or due to an issue identified within the water industry that could potentially affect Metropolitan. Through these activities, long-term infrastructure reliability programs are developed and executed to ensure that the reliability of Metropolitan's distribution system is unimpeded, and the overall life-expectancy of its assets is maintained to the most cost-effective standard possible.

Vulnerability Assessments

Vulnerability Assessments involve simulating hazards such as vehicle impact, flooding, fire, equipment failure, third-party impacts, and earthquakes in order to identify their potential impacts to Metropolitan's ability to deliver water. Like the condition assessments, Vulnerability Assessments utilize operator experience and event reviews to identify potential vulnerabilities and impacts. The assessments evaluate both the reliability of individual facilities, as well as the reliability of Metropolitan's system as a whole, if it is exposed to a potential hazard. It is through these assessments that mitigation options are identified to improve reliability.

Potential mitigation includes facility and equipment upgrades, and procedural changes for designing, operating, or maintaining facilities. In addition, mitigation options may include recommendations for Metropolitan's emergency response planning to improve the capability to respond to an unplanned outage and restore service as quickly as possible. The types of hazards assessed include: seismic activity, hydraulic surge, vehicle impact, equipment malfunction, erosion or flooding, fire, corrosion, wind-blown projectiles, third party construction, and vandalism.

As a part of the Vulnerability Assessments, a specific set of reliability design criteria for water treatment plants have been developed to ensure optimal reliability, starting in the design phase. These reliability design criteria establish design practices that ensure that reliability is designed into new facilities, and that the staff uses this criterion when reviewing each capital project.

Dam Safety Program

Metropolitan owns, operates, and maintains 20 facilities under the jurisdiction of the California Division of Safety of Dams (DSOD). In total, there are 24 individual dams/reservoir facilities, with some reservoirs having multiple dams. The Dam Safety Program is a robust and proactive comprehensive management program that includes daily or weekly observations and regularly scheduled detailed inspections in addition to mandatory annual inspections with DSOD personnel.

Metropolitan also ensures dam integrity by incorporating surveillance and monitoring instrumentation that measures specific parameters, including, but not limited to, seepage and structural movement. Staff also conducts cyclical facility assessment to identify potential vulnerabilities to dam embankments, dam structures, foundations, outlet structures and spillways. In addition, staff prepares Emergency Action Plans and regularly updates the associated inundation maps as required by the DSOD.

3.5 Recycling, Groundwater Recovery, and Desalination

Metropolitan continues to support local resources development through its Local Resources Program (LRP). The LRP provides financial incentives for local agencies to develop supplies including water recycling, groundwater recovery, and seawater desalination. In addition, for the first time, Metropolitan is planning for its own recycled water supply. The Regional Recycled Water Program would provide advanced treated water that could be used for both potable and non-potable reuse.

Metropolitan's involvement in local resources development started in 1982 as the Local Projects Program to provide financial incentives to its member agencies to develop recycled water projects. In 1991, Metropolitan established the Groundwater Recovery Program to provide financial assistance for the development of groundwater recovery projects. In 1995, these two programs combined into the LRP. Water recycling projects involve further treatment of treated wastewater that is currently discharged to the ocean, streams, or lands and use it instead for non-potable uses such as landscape and agricultural irrigation, commercial and industrial purposes, and for indirect potable uses such as groundwater replenishment, seawater intrusion barriers, and reservoir water augmentation. Currently, more than half of the water recycling in California occurs in Metropolitan's service area.

Groundwater recovery projects involve treatment of high salinity or contaminated groundwater for potable uses. Groundwater recovery projects use a variety of treatment technologies to remove undesirable constituents such as nitrates, volatile organic compounds (VOCs), perchlorate, color, and salt. Desalination of brackish groundwater and other local supplies enhances the continued supply reliability of the region by maximizing local groundwater resources.

Metropolitan's service area is also leading the development of seawater desalination in California. The 56 TAF Carlsbad Desalination Project in San Diego County started operations in 2015 and represents the largest seawater desalination project in the country. Several other local water agencies are considering seawater desalination projects. One of the largest of these is the Huntington Beach Seawater Desalination Project, currently being developed by Poseidon Resources LLC (a private company). These projects have the potential to help meet Metropolitan's current goals for new local supplies.

Metropolitan's Regional Recycled Water Program, a partnership with the Los Angeles County Sanitation Districts (Sanitation Districts), would purify treated wastewater from the Sanitation Districts' Joint Water Pollution Control Plant. The program could produce up to 168,000 acre-feet of purified water for groundwater replenishment, industrial use, and potentially raw water augmentation. The agencies have been working together for over 10 years on the program. They are currently operating a demonstration facility and seeking approval from their Boards of Directors to begin the environmental planning phase. At full-scale, the program could be one of the largest water reuse efforts of its kind in the world.

Background

Recycling

This section provides a description of the wastewater sources that potentially could be recycled. This section also discusses the existing and potential uses of recycled water, as well as the technical and economic issues associated with those uses. In general, Metropolitan supports:

- Increasing water recycling in California and the Colorado River Basin

- Advocating funding assistance by parties that benefit both directly and indirectly from the use of recycled water
- Expanding recycled water uses
- Reviewing recycled water regulations to ensure streamlined administration, and public health and environmental protection
- Planning efforts and voluntary cooperative partnerships at the local and statewide levels
- Conducting research and studies to address public acceptance, new technologies, and health effects assessments
- Increasing cooperation between agencies to serve recycled water in other agency service areas

Wastewater Disposal in the Service Area

As part of regional planning that encourages use of recycled water, a database has been developed that includes the name of each wastewater treatment facility, operating agency, location and elevation of the facility, extent of wastewater treatment, capacity and anticipated production, method of effluent disposal, and influent and effluent water qualities. Table 3-8 shows the existing and projected total effluent capacities of the wastewater treatment plants from a database of 89 plants identified within Metropolitan's service area.

Wastewater treatment capacity provides an indication of the amount of wastewater being generated and disposed in Metropolitan's service area. Most wastewater plants in the service area provide secondary treatment, a level of treatment that complies with the Clean Water Act. Inland wastewater plants generally provide treatment to tertiary levels so the effluent may be disposed of in a stream or other water body or for beneficial reuse. A growing percentage of tertiary treated effluent undergoes reverse osmosis or electrodialysis reversal processes, producing high-quality recycled water for groundwater replenishment, industrial uses, or, in some instances, municipal uses.

Within Metropolitan's service area, many local agencies collect and treat municipal wastewater. Some of the largest agencies include:

- Los Angeles County Sanitation Districts
- Orange County Sanitation District
- City of Los Angeles Bureau of Sanitation
- San Diego Metropolitan Wastewater Department
- Eastern Municipal Water District
- Western Municipal Water District
- Inland Empire Utilities Agency

Table 3-8
Existing and Projected Total Effluent Capacity
Wastewater Treatment Plants within Metropolitan's Service Area[1]

Treatment Level	Existing Capacity (MGD)	2040 Capacity (MGD)
Primary	1,770	3,139
Secondary	1,169	2,708
Tertiary	434	1,464
Advanced	104	229

[1] This data was compiled as part of the Southern California Comprehensive Water Reclamation and Reuse Study in 2002. As of the date of this UWMP, this reuse study has not been updated to reflect new information.

Many small special-purpose wastewater agencies, dual-purpose (water and wastewater) special districts, and municipal wastewater agencies also provide wastewater treatment and disposal services within Metropolitan's service area.

Wastewater is collected in a sewer collection system. From there, it flows to a wastewater treatment plant. Once treated, wastewater is disposed of through one of three mechanisms:

Ocean Outfalls

Treated wastewater is either disposed of directly through an ocean outfall or conveyed to the ocean outfall via a land outfall.

Reuse

Currently, about 441 TAF per year of recycled water is used for landscape irrigation, industrial processes, and groundwater replenishment applications in the region. A few inland treatment plants (in Riverside and San Bernardino counties) irrigate feed and fodder crops with recycled water. While this use is considered beneficial, it is not necessarily the highest and best use for recycled water. Higher value uses of recycled water include landscape or agricultural irrigation, commercial and industrial applications, groundwater replenishment, seawater intrusion barrier, and other uses such as street sweeping and dust control.

Stream Discharge

The majority of inland plants discharge treated effluent into local streams and rivers. That water is then used downstream for beneficial uses, eventually flowing to the ocean. Some of the affected rivers (or ephemeral streams) include:

- Los Angeles River
- Santa Ana River
- Calleguas Creek
- Rio Hondo & San Gabriel Rivers
- Santa Margarita River

Uses of Recycled Water

Water recycling is a reliable water supply, and it helps local agencies comply with environmental regulations. Uses of recycled water can generally be categorized as non-potable, indirect potable for groundwater replenishment or reservoir water augmentation, and direct potable.

Non-Potable Reuse

- *Industrial* – Industrial users represent a large potential market for recycled water, particularly in heavily industrialized areas, such as the cities of Vernon, Commerce, Industry, and the Wilmington area of Los Angeles. Additionally, refineries in West Basin MWD's service area and the city of Torrance use recycled water. Typical industrial uses include cooling tower makeup water, boiler feed water, paper manufacturing, carpet dying, and process water. Industrial users are high-demand, continuous-flow customers, which allows greater operational flexibility by allowing plants to base load operations rather than contend with seasonal and diurnal flow variations. Because of these operational benefits, industrial users reduce the need for storage and other peak demand facilities and management.
- *Irrigation* – Recycled water is used to irrigate golf courses, parks, schoolyards, cemeteries, greenbelts, roadway medians, and agricultural purposes throughout Southern California. Using recycled water for irrigation reduces the need for imported water during the critical summer months and in drought situations when water supplies are scarce. Unlike industrial uses, irrigation demands have large seasonal variations in reuse.

Indirect Potable Reuse

Indirect Potable Reuse (IPR) refers to the use of recycled water for groundwater replenishment, and reservoir water augmentation purposes. These types of uses require additional treatment levels beyond irrigation uses and use of an environmental buffer.

- Groundwater Replenishment – Metropolitan's service area overlies numerous groundwater basins, most of which rely on artificial recharge to sustain groundwater production, and some of which are threatened by seawater intrusion. Water agencies along the Los Angeles and Orange Counties coastline inject water into the underlying groundwater basins to create a barrier against this seawater intrusion and protect groundwater quality. The use of recycled water for seawater intrusion barrier projects is increasing and is replacing imported water used for this purpose. Increasing the proportion of recycled water can free imported water for direct consumption. For example, Metropolitan's Regional Recycled Water Program would provide purified recycled water instead of imported water to replenish multiple groundwater basins in the region, making imported water available for other purposes. Table 3-9 presents a summary of this recycled water use.
- Reservoir Water Augmentation – Reservoir Water Augmentation (previously identified as surface water augmentation) includes use of advanced treated recycled water to augment a surface water reservoir. The reservoir serves as an environmental buffer (similar to groundwater aquifer in the case of groundwater replenishment) prior to when recycled water is treated for potable uses. Blended water from the reservoir is then treated at a conventional water treatment plant for potable purposes. There is currently no reservoir water augmentation with recycled water in Metropolitan's service area. The State Water Resources Control Board (SWRCB) adopted the surface water augmentation regulations, required under SB 918, in 2018. The City of San Diego is currently operating a demonstration project to evaluate the feasibility and expected permitting requirements of a full-scale reservoir water augmentation project.

Table 3-9
2020[1] Recycled Water Use for
Groundwater Replenishment and Seawater Barrier Injection
(TAF per year)

Groundwater Basin	Recycled Water Use
Central Basin	56
Chino Basin	13
Orange County Basin	97
West Coast Basin	12
Other Basins	1
Total	**179**

[1] Data for 2020 not available at the time of publication, used average of 2017-2019.

Direct Potable Reuse

Direct Potable Reuse (DPR) refers to the use of advanced treated municipal recycled water as a direct supply before or after a conventional water treatment plant. DPR does not require an environmental buffer. There are two distinct forms of DPR: raw water augmentation, and treated drinking water augmentation. Currently, there are no permitted DPR projects in California. The report to the Legislature on DPR feasibility is complete (December 2016). In addition, SWRCB issued a framework for regulating DPR (1st edition April 2018, 2nd edition August 2019).

Raw Water Augmentation

Raw Water Augmentation (RWA) refers to the use of advanced treated wastewater as a direct supply before a conventional water treatment plant. Metropolitan is considering RWA as part of the Regional Recycled Water Program. This DPR option would involve delivery of advanced treated water upstream of the Weymouth and/or Diemer water treatment plants.

Treated Water Augmentation

Treated Water Augmentation means the planned placement of recycled water into the water distribution system of a public water system.

Technical and Economic Issues of Recycled Water

Recycled water use is growing rapidly in Metropolitan's service area. Further expansion depends on progress in research, regulatory change, public acceptance, water quality issues, cost, operational issues, and conflicting institutional objectives. Each of these challenges, as well as opportunities for recycled water use, lessons learned, and recommendations to enhance the development of recycled water, is discussed below.

Challenges

Lengthy and Variable Permitting Process

The SWRCB established the Recycled Water Policy (Policy). This Policy requires the SWRCB and the nine Regional Water Quality Control Boards (Regional Boards) to encourage the use of recycled water, consistent with state and federal water quality laws. The Policy provides additional direction to the Regional Boards on appropriate criteria to be used in regulating recycled water projects. The Division of Drinking Water (DDW) and the nine Regional Boards are responsible for setting the rules and permitting for recycled water projects. The timeline and roadmap for getting a permit are challenging and inconsistently implemented in different regions of the state. Limited history and technical information (e.g., on DPR) to inform regulations and limited staffing at DDW and other agencies have challenged the ability to propose, revise, and adopt new regulations in a timely manner. Agencies planning and designing DPR and IPR projects face delays because of regulatory uncertainty. In addition, many project proponents seeking grant or loan funding have identified lengthy CEQA review as a challenge.

IPR projects face regulatory constraints such as treatment, blend water, retention time, and Basin Plan Objectives, which are the designated uses assigned by the SWRCB and which may limit how much recycled water can feasibly be recharged into the groundwater basins. For example, the Basin Plan Objective for TDS of a particular basin may be lower than the quality of the tertiary water effluent available, resulting in the need for more blended water or advanced levels of treatment. These treatment requirements impact the economic feasibility of a project.

Public Perception/Conflicting Messaging

Public acceptance of recycled water is critical in implementing water reuse projects, especially potable reuse projects. In the past, public opposition halted a number of recycled water projects, citing concerns about the source of the water and resulting water quality.

The public does not have a clear understanding of the difference between non-potable reuse, IPR, and DPR. The public is most familiar with non-potable reuse as they see recycled water in use at parks, golf courses, schools, and other large landscapes. Signage for non-potable reuse projects at parks, schools, and golf courses that read, "Using recycled water; do not drink" can adversely affect the public's acceptance of DPR and IPR even though IPR has been used in some areas for over 50 years.

With effective outreach, public understanding and acceptance of potable reuse have improved. Projects such as Orange County's Groundwater Replenishment System conduct tours and presentations to thousands of people, raising awareness of the project, addressing water quality concerns that may be associated with recycling wastewater, and gaining support. Metropolitan's Regional Recycled Water Program also involves extensive outreach to the communities impacted by the program.

Education and public outreach are still needed. Any water reuse effort must include public engagement to build awareness of the project and acceptance of recycled water as a new supply.

Cost

Cost, including up-front capital and ongoing operation and maintenance, remains a concern to recycled water development for some agencies. The cost for expanding recycled water distribution systems remains a significant consideration to full implementation of non-potable reuse projects, as these projects require pipelines connecting the treatment plants and the individual users. Some non-potable reuse and IPR projects and all DPR projects require advanced treatment facilities, which are comparatively expensive. Advanced treatment may also require additional concentrate disposal facilities (e.g., a brine line) and extensive infrastructure for injection wells/spreading facilities, or for delivery of the product water to a spreading ground, surface reservoir, or water treatment plant for potable uses. Ultimately, end users play a very important role for recycled water advancement. Site conversion costs (borne by the customer) and additional conveyance infrastructure for new customers can also be significant considerations in reaching full non-potable reuse project capacity. Some agencies may be challenged with cash flow issues or inability to secure the funding needed to implement projects.

In addition, with the increasing prospect of statewide regulations, some agencies pursuing IPR may be hesitant to extend their existing distribution system for non-potable reuse projects for fear of stranded facilities. Similarly, some agencies pursuing DPR may delay their planned indirect potable reuse projects to prevent stranded distribution facilities.[3]

Source Control and Effluent Water Quality Needs

Source water quality and flow control is essential to help safeguard the water recycling treatment process and the end use of the water by placing controls on the type, timing, and amount of wastewater that comes into the plant. A good source control program limits wastewater treatment plant disruptions and ensures treatment processes are capable of handling spikes in volume, industrial influent, and high salinity influent. When it comes to the treatment process, recycled water policy requires that the effluent meets certain water quality standards. Salt and nutrient management plans protect groundwater beneficial uses and prevent excess degradation, which may limit expanded IPR applications if the agency does not have funds for advanced treatment to remove salts to meet the Basin Plan Objectives. In some cases, existing source control plans may need to be updated to deal with constituents of emerging concern and with more stringent needs of the users.

Source water quality for non-potable reuse can be affected by drought patterns in Southern California. Drought years with low State Water Project allocations will increase potable water salinity and, as a result, increases the salinity of source water for water reclamation plants. High salinity in wastewater decreases the viability of recycled water for irrigation uses and may also cause NPDES discharge violations for local agencies.

Water use efficiency helps conserve water, but also incidentally reduces wastewater volume resulting in an increase in the concentration of wastewater. As a result, additional treatment is needed, which increases operation and maintenance costs of the system. Source water quality is especially important for implementing IPR and DPR projects to protect potable water systems.

Operational Issues

While each agency is different, it is important to recognize the possible operational issues that may occur with the use of recycled water, including:

- Reduction in wastewater flows due to ongoing conservation and drought
- Lack of seasonal storage to address diurnal and seasonal demands; construction of storage facilities may be needed for flow equalization
- Concentrate disposal needs
- Environmental flow or stream discharge requirements may limit the ability to deliver recycled water during high demand periods
- Regulatory issues such as blend requirements and water quality objectives may impact the effectiveness of IPR
- Need for multiple barriers to ensure recycled water quality and for monitoring techniques that provide feedback in real-time to respond to plant disruptions, especially with DPR projects
- Need for additional operator training and certification

---

[3] Indirect potable reuse projects usually require injection wells or a distribution system to a surface reservoir or recharge basin, and may also require improvements to a surface reservoir, recharge basin, or treatment facility.

Opportunities

Progress Towards New Regulatory Process

The State of California has made progress in developing permit standards that provide opportunities to expand recycled water use.

In December 2018, the State Recycled Water Policy was amended to further encourage use of recycled water from municipal wastewater, promote standardized state-wide implementation, and provide directions for Regional Boards, proponents, and the public when issuing permits. The amended policy included standardized annual reporting requirements and updated recycled water categories for better tracking. The Policy also included baseline monitoring requirements for emerging contaminants.

Non-potable reuse: The SWRCB adopted a general permit (Order WQ 2016-0068) for most non-potable beneficial reuse of treated municipal wastewater in June 2016. The permit provides an opportunity for non-potable reuse projects to come online sooner with standardized conditions and conditionally delegated authority for an Administrator to manage a local water recycling program. Revisions to the Recycled Water Policy in 2018 further standardized statewide implementation requiring most regional non-potable reuse permits be moved to the statewide general permit.

On-site treated non-potable water systems legislation (SB 996, Chaptered September 2018), requires the SWRCB to adopt risk-based water quality regulations by December 1, 2022. The legislation also requires local jurisdictions to adopt ordinances and requires treatment systems to comply with adopted water quality standards.

IPR and DPR: The SWRCB adopted uniform water recycling criteria for IPR for groundwater recharge in June 2014 and reservoir (surface water) water augmentation in March 2018. The SWRCB is facing a December 31, 2023 deadline from AB 574 to develop regulations for DPR through raw water augmentation. AB 574 also requires the establishment and administration of a science advisory panel to provide DPR guidance and assurance of protection of public health. Per the State's August 2019 DPR framework, the State will be developing a regulatory package for both treated and raw water augmentations concurrently.

Metropolitan continues to work with the WateReuse Association and other agencies on legislative and regulatory issues to streamline permitting processes and to provide needed funding and support for increased use of recycled water.

New Funding Opportunities

Proposition 1 provided $625 million for water recycling projects. Grants and loans for planning and construction are administered through the SWRCB's Water Recycling Funding Program. An additional $100 million was available through DWR for desalination.

Proposition 13, approved by voters is 2000, is also used to fund grants and loans for planning and construction of recycled water projects. Repayment of low-interest loans from previous projects allows limited funding from this program to continue.

Proposition 68, approved by the voters in 2018, provided $72 million in grants and loans for recycled water planning and construction activities. The remaining funding has been committed by the SWRCB for disadvantaged community projects. The SWRCB has committed to spend the remaining available Prop 1 and Prop 68 funding on approved projects on the FY 2020-21 Intended Use Plan.

The Clean Water State Revolving Fund (CWSRF) provides low-interest loans to public agencies for planning, design, and construction of water recycling projects. There is currently a substantial backlog of CWSRF projects on the FY20-21 Intended Use Plan (~$7 billion) that could limit the number of new projects approved over the next several years.

The Water Infrastructure Finance and Innovation Act (WIFIA) program was authorized by the Water Resources Development Act of 2014. The program is similar to the State Revolving Fund programs like the CWSRF program but is intended to provide federally subsidized low-interest loans for up to 49 percent of large regional projects.

Title XVI Water Reclamation and Reuse Program was established in 1992 and provides grant funding up to 25 percent of project costs or $20 million for selected projects in the western U.S. Title XVI requires projects be either congressionally authorized or competitively selected after USBR approval of a feasibility study.

In 2014, Metropolitan increased the financial incentives under its LRP for agencies to develop recycled water. Metropolitan also established the On-site Retrofit Pilot Program to provide rebates to customers that convert their irrigation and industrial system from potable water to recycled water. In addition, Metropolitan established the Reimbursable Services Program to provide technical and construction assistance to its member agencies for local project development. Under this program, Metropolitan advances funds and is reimbursed by the agency.

Improving Public Perception

Recent droughts have heightened water awareness in the region and have provided momentum for water conservation and reuse. The public is more willing to accept alternative supplies such as recycled water. Extensive public outreach and education have also helped improve the public's perception of recycled water. Public sharing of information, open door stakeholder meetings, and focus groups have been very effective at distributing information and addressing public concerns. Case studies and demonstration projects are used to educate and improve public acceptance of recycled water.

Agencies are working together to share best practices for public outreach, create consistent messaging, simplify water reuse terminology, and ensure effective communications with the public. One such group is the WateReuse California Communications Collaborative Group, which provides a forum to discuss and collaborate on water reuse communications. The group offers resources for communications professionals, including a terminology document to provide consistent and simple water reuse terminology, for use with the public.

New Technologies, Research, and Information Sharing

New technologies, research, and information sharing greatly enhance the development of recycled water. Programs such as Metropolitan's Future Supply Actions (FSA) Funding Program focus on technical studies and pilot projects that reduce barriers to future local production. Projects under this program include optimizing new treatment techniques for recycled water, exploring new monitoring methodologies, and testing innovative brine concentration technology. In addition to the technical portions of this program, the FSA Funding Program supports collaboration between agencies and regional sharing of information.

Metropolitan is also conducting cutting-edge research at the Regional Recycled Water Advanced Purification Center. The demonstration facility is testing the effectiveness of membrane bioreactors followed by reverse osmosis and ultraviolet disinfection/advanced oxidation in the advanced water treatment process. During testing, Metropolitan and the Sanitation Districts are analyzing water quality for removal of various contaminants, especially microorganisms. The agencies are also working closely with state regulators and an independent scientific advisory panel to oversee the work. Once regulators approve the process, it may be used throughout California. Additional research on membrane bioreactors and potential purification processes to address raw water augmentation are also planned at the demonstration facility. The studies will help further potable reuse in California and across the globe.

Research is especially critical in advancing new water supply options, such as DPR. WateReuse, in partnership with other agencies (including Metropolitan), is leading the California Direct Potable Reuse Initiative [4] to advance DPR as a water supply option in California and to address regulatory, utility, and community concerns. WateReuse's report *Direct Potable Reuse: A Path Forward* [5] provides an overview of DPR and identifies research needs.

Regional studies can also examine the needs of multi-jurisdictional areas and foster communication among agencies to promote the use of recycled water. For example, sharing regional information such as GIS data can identify areas of recycled water surpluses and needs.

Partnerships

Drinking water, wastewater, and groundwater management agencies share some common objectives, including access to source water, cost minimization, and protection of the environment. Many agencies are successfully cooperating and developing recycled water projects. These partnerships can allow sanitation districts to reduce the cost of disposing treated wastewater in the ocean, reduce impacts to the marine environment, and provide a source of reclaimed water to water agencies for recycling. At the same time, groundwater basin management agencies could be the recipients of final recycled water, helping maintain or increase groundwater levels.

Lessons Learned

There have been many success stories on recycled water development. Focusing on public outreach and education has improved public perception. Partnerships and joint efforts among water and wastewater agencies proved to be an effective way to remove barriers and make progress. Numerous studies and research funded by federal, state, and local agencies are benefitting local and regional efforts.

Public Outreach is Important

Public outreach and education have helped improve the public's perception of recycled water. Both experience and research have shown that when the public is informed and takes part in the decision-making process, they will likely accept and support recycled water as a new supply in their community.

Water shortages raise awareness for alternate ways to conserve. As a result, the public is more willing to accept alternative supplies such as recycled water, support the more expensive projects, and tolerate rate increases. Potable reuse projects throughout Southern California are advancing due to this increased public awareness and support. Non-potable reuse is also increasing. Some residential property owners are interested in using recycled water for watering plants to help with the drought. For example, residents have access to recycled water from "residential recycled water fill stations" in the Irvine Ranch Water District. Programs like these improve public acceptance of recycled water, increase recycled water use, and conserve potable supplies.

---

[4] https://www.watereuse.org/foundation/research/direct potable reuse-Initiative
[5] https://www.watereuse.org/product/direct-potable-reuse-path-forward

Standard practice for water reuse projects now includes robust outreach. Many projects dedicate considerable resources towards public engagement. For example, Metropolitan's Regional Recycled Water Program features a learning center at its demonstration facility to provide a platform for public outreach. The facility and learning center are used to conduct tours, introducing the public to the program and potential new source of water.

Additional Funding is Needed

LRP incentives and onsite retrofit program funding have increased use of recycled water in the region by almost 200 percent. However, incentives alone may not be enough to spur project development - capital funding is also necessary because the LRP pays for project performance; in other words, it provides funding after a project begins operation. Metropolitan increased its LRP incentive rate in 2014, and also offers three options for an agency to receive funding. Agencies select the option that allows the project to receive incentives when they are needed, recognizing the higher costs borne by the agency and lower cost recovery at the start of operation. Although available construction funding for recycled water projects has increased under Proposition 1, projects generally still require a 50 percent local match. One source of funding is typically not enough to fund a recycled water project.

Partnerships Can Be Successful

History shows us that partnerships among agencies help advance use of recycled water and provide tangible benefits to each participating agency. A good example of partnerships working well is the agreement between Orange County Water District (OCWD) and the Orange County Sanitation District. This partnership began in the 1970s, when OCWD built the Water Factory 21 to produce recycled water to mitigate seawater intrusion in the Orange County Groundwater Basin. Twenty years later, the two agencies decided to jointly build the Groundwater Replenishment System (GWRS) recycled water project. The GWRS is the largest planned IPR facility in the world with a current capacity of 100 TAF per year and future expansion to 130 TAF per year.

Other examples of cooperation between agencies to further recycled water use include partnerships between the city of Los Angeles and West Basin Municipal Water District (West Basin Water Recycling Program), the City of Los Angeles and the City of Burbank (North Hollywood Water Recycling Project), City of Long Beach and the Water Replenishment District (Alamitos Barrier Water Recycling Project), and the Los Angeles County Sanitation Districts and Central Basin Municipal Water District (Century and Rio Hondo Water Recycling Project).

In addition, Metropolitan and the Sanitation Districts have been in partnership since 2009 to develop a regional recycled water project for groundwater replenishment and raw water augmentation. The Regional Recycled Water Program (RRWP) would produce up to 150 MGD of purified water from the Joint Water Pollution Control Plant in Carson. As a first step toward full implementation, Metropolitan and the Sanitation Districts cooperated to complete the Advanced Purification Center in 2019. The Advanced Purification Center is a 0.5 million gallon per day demonstration facility that will generate information needed for the potential future construction of a full-scale recycled water facility. It uses a unique application of membrane bioreactors designed to significantly increase efficiency in water recycling. Scientists and engineers will test the process, utilizing full-scale treatment modules, to ensure the resulting purified water meets the highest water quality standards. Once approved by regulators, this innovative process could be used throughout California and even applied around the globe. Metropolitan and the Sanitation Districts are continuing to move forward with the program, to enhance their partnership and begin the next phase of the program. Metropolitan's Board approved proceeding with the environmental planning phase of the project in November 2020.

Metropolitan is also in partnership with many other organizations to collaborate on this program. Potential recipients of the water, such as groundwater basin managers and member agencies, are partners. The Southern Nevada Water Authority, Central Arizona Project and Arizona Department of Water Resources are also partners, collaborating on how the project could support Colorado River water use. Metropolitan is also partnering with LADWP to work together to develop recycled water. LADWP's Operation Next Program to reuse wastewater from Hyperion is also a key project in development and could provide a potable supply for the region.

Water Industry Organizations and Regional Collaboration Help Advance Recycled Water

Recent advancements to recycled water development are due, in large part, to cooperation and collaboration among water and sanitation districts, as well as other water industry organizations. Historically, the WateReuse Association was one of the main advocates for recycled water development in the state. Their activities initially focused on permitting issues, public outreach/education, conferences for information sharing, and research related to recycled water. As recycled water became a core resource for water and wastewater agencies, they started to ramp up their activities to help advance recycled water and utilized partnerships with academia along with other trade organizations such as the Association of California Water Agencies, California Urban Water Agencies, WateReuse Association, and California Association of Sanitation Agencies. Professional organizations such as American Water Works Association are another vehicle to promote recycled water through research, technical seminars, and operator training and certification. These organizations have proven to be effective in promoting regional collaboration on research and leveraging resources. Recently, the Southern California Water Coalition (SCWC) has launched the Recycled Water Task Force with the goal of addressing barriers, gaining acceptance, and educating stakeholders on recycled water.

Recommendations

Explore Opportunities to Improve Permitting Process

- Streamline and simplify water recycling regulations with uniform administration consistent with operations, public health, and the environment
- Support legislation and regulation that expand the types of recycled water uses consistent with the protection of public health and help achieve the state's recycled water goal
- Convene a forum to discuss projects, permitting, and treatment technologies

Improve Public Education and Awareness of Water Recycling

- Continue to pursue unified, consistent messaging
- Consider updating signage for non-potable reuse, expanding residential fill stations, and other public outreach strategies to further advance public acceptance of recycled water
- Use demonstration facilities and learning centers like the Regional Recycled Water Advanced Purification Center to educate the public and key stakeholders about recycled water

Explore Various Investment Strategies, Such as Incentives, Ownership, and Partnerships

- Promote collaboration among stakeholders and agencies to facilitate implementation of recycled water projects in California

- Promote development of new financing to increase water recycling, advance research in science and technology, assess health effects, develop additional regional planning, and study innovative technologies
- Explore the development of recycled water partnerships or ownership
- Pursue the RRWP as a showcase of recycled water development
- Consider additional end user programs to replace potable water systems with recycled water
- Collaborate on pursuing grant funding

Consider Joint Technical Studies and Projects

- Explore integration approaches
- Investigate programs for the development of new technologies, such as comprehensive real-time monitoring devices and techniques that improve water quality and ensure public health, and maintain public confidence
- Study opportunities to protect or improve the quality of wastewater source supplies, as well as optimizing wastewater treatment for use in potable reuse applications
- Explore development of a regional study to help identify opportunities for seasonal storage
- Advance research that supports timely development of DPR regulations in California

Groundwater Recovery

All Southern California groundwater basins experience varying degrees of water quality challenges as a result of urban and agricultural uses. The accumulation of high-salinity water and degradation from volatile organics are two common constraints to the economic use of groundwater for urban applications. In some cases, the threat of increased salt buildup can also complicate conjunctive use of groundwater basins and imported supplies.

Use of degraded groundwater normally requires high levels of treatment. Membrane processes used to recover the majority of severely degraded water have a high capital cost and incur a high operational cost for power. Once treated, however, recovered groundwater may be integrated into potable water systems. Metropolitan initiated its Groundwater Recovery Program (GRP) in 1991 to encourage local agencies to treat and use degraded groundwater for municipal purposes. The GRP was open to all technologies that recovered and used degraded groundwater. The GRP was retired in 1998 and folded into Metropolitan's LRP.

Seawater Desalination

The constant availability of ocean water regardless of weather or climate is one of the key benefits of seawater desalination. Countries with arid or Mediterranean climates and/or growing populations with developing economies have embraced seawater desalination as a drought and climate resistant option for meeting water needs. In the past 20 years, water agencies in Australia, Spain, Singapore, Hong Kong, India, China, Israel, and other countries throughout the middle east have implemented large-scale seawater desalination plants in response to droughts and to meet growing demands. Within Southern California, San Diego County Water Authority, the City of Santa Barbara, and communities on Catalina Island have supplemented their water supplies with seawater desalination.

Seawater desalination projects provide unique benefits as part of a diversified water resource portfolio. In California, they also present unique development challenges compared to other alternative resources. Table 3-10 provides a summary of the primary benefits and challenges:

Table 3-10
Summary of Benefits and Challenges of Seawater Desalination Projects

Benefits	Challenges
• Highly reliable potable supply resistant to weather variations and climate change • Low salinity, high-quality resource improves supply blends and supports reuse • Locally controlled • Does not affect and is not affected by upstream or downstream water rights – truly a new supply • Located near coastal population centers • Supports Southern California's desalination industry cluster and innovation centers	• Expensive compared to many alternative existing supplies and some new alternative supplies • Potential marine life impacts • Local community and environmental opposition • Permitting uncertainty and development risk • Energy intensive and thus increased exposure to energy rate uncertainty • Demand risk in wet years

Metropolitan and its member agencies have been considering seawater desalination as a potential new supply source since the 1960s. Up until the 1990s, seawater desalination was considered expensive compared to other resource alternatives, especially imported water. Advances in membrane technology, energy recovery, and process design in the 1990s lowered desalination costs compared to other new supply alternatives.

By the early 2000s, several member agencies began pursuing local projects to diversify their resource portfolios. In 2001, Metropolitan created an incentive program, the Seawater Desalination Program (SDP), to support these projects. Soon after, the Board approved Metropolitan's role as a regional facilitator for seawater desalination with the purpose of assisting the member agencies with state and regional development issues. Metropolitan signed SDP agreements with Long Beach, MWDOC and West Basin in 2006. In 2014, Metropolitan merged seawater desalination projects into the LRP to promote development of additional local supplies in the region. Metropolitan's SDP agreements with the three member agencies expired in June 2020.

In order to protect California's coastal and marine resources, seawater desalination projects in the State must meet stringent environmental regulations. Relevant regulations include the California Ocean Plan and Marine Life Protected Area restrictions. Additionally, projects located near coastal generating stations are affected by the California's Once Through Cooling regulations. Each of these is discussed below:

<u>Ocean Plan Regulations</u>

In May 2015, the SWRCB updated California's Ocean Plan with regulations for new seawater desalination projects. The regulations include requirements for ocean water intakes, outfalls, brine discharges, mitigation, monitoring and permitting. Regional Water Quality Control Boards are responsible for implementing the regulations and have broad powers over project design elements.

Marine Life Protected Areas

In 2011, the California DFW adopted a system of 50 Marine Life Protected Areas (MLPAs) covering approximately 15 percent of Southern California's coastline[6]. MLPAs are defined zones along the coast where certain commercial and recreational activities are restricted. Most construction and operational activities associated with seawater desalination are prohibited in MLPAs with the exception of certain types of subsurface intakes. MLPAs are located along the Channel Islands, the mainland coast, and locations surrounding the Channel Islands. The MLPA network includes areas near planned seawater desalination projects. In October 2020, Governor Newsom announced a 30 percent by 2030 initiative. The initiative calls for preserving 30 percent of the California's lands and coastal waters by 2030. Implementation of the initiative may increase MLPAs within Southern California's coastal waters and could affect potential sites for seawater desalination projects. Additional MLPAs may also provide marine life mitigation opportunities for potential projects.

Once-Through Cooling Regulations

Prior to the revised Ocean Plan regulations, the SWRCB in 2010 adopted regulations requiring coastal power plants to phase out the use of once-through-cooling (the use of seawater to cool generators in a single-pass system) by 2030. As once-through-cooling is phased out, many of the environmental and operational benefits of co-locating seawater desalination projects with coastal power plants have been diminished. However, coastal power plants remain attractive sites for development due to the presence of coastal-dependent industrial zoned land, power infrastructure, and the potential to repurpose existing infrastructure.

Changed Conditions

The status of locally planned projects changes from year to year. Metropolitan periodically surveys its member agencies for planned projects to coordinate local supply projections and plans. Recent changes in long-term strategies, regulations, and funding priorities could provide new opportunities to develop these resources.

Recycled Water

Several recent state policies and adopted codes help recycled water development as described below.

SWRCB adopted the State Recycled Water Policy (Policy) in February 2009 after several years of negotiation and amended it in 2013 to include the monitoring and analytical requirements for constituents of emerging concern (CEC). The Policy supports the SWRCB Strategic Plan to promote sustainable local water supplies and establishes a mandate to increase the use of recycled water in California by 1 MAF per year over 2002 levels (approximately 525 TAF) by 2020 and by an additional 3 MAF per year by 2030. The Policy is organized into recycled water goals, roles of agencies, salt and nutrient management plans, landscape irrigation, groundwater replenishment, anti-degradation, emerging constituents, and recycled water incentives.

SWRCB's General Permit for Recycled Water Use was adopted June 4, 2014, in response to the Governor's drought declaration and to facilitate the use of recycled water to offset potable water demands. Coverage is available to most treated municipal wastewater for non-potable uses, but specifically excludes groundwater replenishment. Monitoring for CECs is not required for non-potable uses. Application of recycled water for irrigation sites is limited to agronomic rates.

[6] http://www.wildlife.ca.gov/Conservation/Marine/MPAs/Network/Southern-California

On November 18, 2009, the Building Standards Commission unanimously voted to approve the California Dual Plumbing Code that establishes statewide standards for installing both potable and recycled water plumbing systems in new commercial, retail, and office buildings, theaters, auditoriums, condominiums, schools, hotels, apartments, barracks, dormitories, jails, prisons, and reformatories. The code was adopted January 15, 2010, with an effective date of January 1, 2011.

Assembly Bill 2071 (Levine 2014) directed the SWRCB, in consultation with other agencies, to determine if the voluntary use of disinfected treated recycled water for watering animals would pose a significant risk to the public and animal health. Use of recycled water would be prohibited for dairy animals that are producing items for human consumption. An expert panel provided recommendations in 2018 including source control, ultraviolet light disinfection, and animal health surveys. The SWRCB will require these conditions in proposed projects and update the Title 22 Water Recycling Criteria. Permit conditions for a use of recycled water not addressed by the uniform statewide water recycling criteria shall be considered on a case-by-case basis.

The SWRCB shall update the uniform statewide criteria for non-potable recycled water uses by January 1, 2023.

Assembly Bill 2282 (Gatto 2014) directed the California Building Standards Commission to adopt mandatory building standards for the installation of recycled water systems for newly constructed commercial and residential buildings in areas where there is access to a water recycling facility. These standards became effective in July 2018 but were invalidated in 2019 for not complying with the Administrative Procedure Act. The California Building Standards Commission is expected to hold new workshops to address requirements.

Assembly Bill 574 (Quirk 2017) specifies that "direct potable reuse" includes "raw water augmentation" and "treated drinking water augmentation." The bill also changed the term "surface water augmentation" to "reservoir water augmentation" and redefined that term to mean the planned placement of recycled water into a raw surface water reservoir used as a source of domestic drinking water supply for a public water system or into a constructed system conveying water to such a reservoir. This bill mandates the following: 1) requires the SWRCB, on or before December 31, 2023, to adopt uniform water recycling criteria for DPR through raw water augmentation, 2) requires the SWRCB to establish and administer an expert review panel, and would require the SWRCB, before adopting the uniform water recycling criteria, to submit the proposed criteria to the expert review panel; 3) prohibits the SWRCB from adopting the uniform water recycling criteria until the expert review panel adopts a finding that the proposed criteria would adequately protect public health; 4) allows the SWRCB to extend the date by which the uniform water recycling criteria are to be adopted if certain criteria are met; and 5) authorizes the SWRCB, after it has adopted the initial uniform water recycling criteria, to reconvene or reestablish the expert review panel.

Groundwater Recovery Brine Disposal

The management of existing regional brine lines and the development of new brine line systems will be a critical factor in the continued growth in brackish groundwater desalination. Brine lines will also be applicable for disposing brine from advanced treatment of wastewater for recycled water use. All processes that recover degraded groundwater also produce concentrated waste flows for which disposal can be problematic. Most importantly, membrane processes such as reverse osmosis—the predominant desalting technology used in Southern California—produce significant volumes of brine that can account for about 15 percent of the treated water. In Southern California, brines generated from brackish water desalination are typically disposed through dedicated brine lines to ocean outfalls or sanitary sewers.

The region currently has two operating brine lines: the Santa Ana Regional Interceptor (SARI line) and the Calleguas Regional Salinity Management Pipeline. The SARI line collects brine from desalters in San Bernardino, Riverside, and Orange Counties and discharges to a treatment plant operated by the Orange County Sanitation Districts (OCSD), with final discharge through the OCSD ocean outfall. A key benefit of the SARI line is that it has allowed inland water agencies to recover impaired groundwater resources which would otherwise be unusable.

A lower portion of the Calleguas Regional Salinity Management Pipeline is in operation while the upper reach is still under construction. The Calleguas Regional Salinity Management Pipeline delivers brine from recycled water plants and groundwater desalination facilities in Ventura County to the ocean.

A third regional line is in the planning phase in San Diego County. The Southern California Salinity Coalition, a coalition of water and wastewater agencies, has advocated for state and federal financial assistance to build these regional brine lines.

Seawater Desalination

Changed conditions for seawater desalination include sustained operations of the Carlsbad Seawater Desalination plant, state and federal funding opportunities, and increased permitting uncertainty.

Carlsbad Desalination Project Operations

In 2015, the San Diego County Water Authority (SDCWA) started taking delivery of supplies from the Carlsbad Desalination Project (Carlsbad Project). The Carlsbad Project is the largest seawater desalination in the United States with a capacity of 50 MGD, or 56 TAF per year. The SDCWA developed the Carlsbad Project under a Public-Private Partnership with Poseidon Resources Inc. Production from the project is guided by a Water Purchase Agreement which specifies minimum and maximum purchases and also determines the price SDCWA pays for the supplies from the project. The following Table shows production from the Carlsbad Project since 2015.

Table 3-11
Claude Bud Lewis Carlsbad Seawater Desalination Program Production[1]

Fiscal Year Ending	Production (AF)
2016	27,349
2017	40,421
2018	40,907
2019	46,036
2020 (est.)	43,868

[1] Source: SDCWA

State and Federal Funding Opportunities

Several State and Federal funding opportunities exist to promote the development of seawater desalination projects. Within California, the Department of Water Resources (DWR) provides funding through the Water Desalination Grant Program. DWR taps limited funds for the Grant

Program from Proposition 1 and in the past from Proposition 50. As of January 2020, the Grant Program has funded over $100 million in grants for 70 projects. The program funds new construction, demonstration projects, and research studies. It also covers brackish water desalination projects. In 2018, DWR converted the program to a continuous application process.

Federal funding for desalination projects includes programs administered by the United States Bureau of Reclamation (USBR) and the Department of Energy (DOE).

USBR promotes desalination through its Desalination and Water Purification Research Program (DWPRP). Under DWPRP, USBR funds research, pilot tests and demonstration projects to improve technologies for desalination and brine management. Program goals include reducing desalination costs, energy use and environmental impacts. USBR operates the Brackish Groundwater National Desalination Research Facility and other desalination technology testing laboratories as part of the program. Several member agencies have received DWPRP grants for local desalination projects.

The DOE established a new Water-Energy desalination hub called the National Alliance for Water Innovation (NAWI). NAWI's focus is to accelerate the development of early-stage desalination technologies in order to lower desalination's costs and energy use. Led by Lawrence Berkeley National Laboratory, NAWI is a consortium of national laboratories, university researchers, private companies and water industry stakeholders. DOE is funding NAWI with $100 million over a five-year period starting in 2020. While the focus of NAWI is early-stage pre-commercial technologies, water agencies will have opportunities to participate in research projects and pilot tests. Water agencies will also help guide NAWI's research agenda. Metropolitan joined NAWI in 2020.

Implementation Approach

Local Resources Program

The Local Resources Program (LRP) is the primary tool for Metropolitan to incentivize local resources development. The success of the LRP is due to its adaptability to changed conditions. Periodically, Metropolitan and its member agencies review and update the LRP in response to water supply conditions.

In October 2018, Metropolitan's Board authorized an interim program target of 170 TAF since the program target established in 2007 of 174 TAF was nearly subscribed. The executed agreements, in combination with submitted and proposed LRP applications, exceeded the remaining program capacity under the 2007 LRP target. By establishing an interim target, Metropolitan continues to encourage and support development of local supplies. The interim target may be revised upon completion of the 2020 IRP.

On-Site Retrofit Program

Metropolitan continues to explore ways to help increase recycled water use. In order for a site to receive recycled water, the potable water systems must be retrofitted for recycled water use. In July 2014, to catalyze an increase in recycled water use, Metropolitan established the On-site Retrofit Program to provide financial incentives directly to public or private property owners to convert potable water irrigation or industrial water systems to recycled water service. The goal of this program is to alleviate some of the costs borne by property owners to retrofit their sites. The program offers a rebate of up $195/AF for five years of estimated water savings, capped at actual retrofit costs. Eligible items include retrofit costs related to project design, permitting, construction, connection fees, and required recycled water signage. The program currently has an annual budget of $2 million and is accepting applications on a first-come, first-served basis until funding is exhausted.

Stormwater Pilot Programs

Metropolitan's 2015 IRP Update called for the development of a diverse resource portfolio through local supply projects – including recycled water, groundwater recovery, seawater desalination, and stormwater capture. Metropolitan has played an active role in the development of those local supplies through different approaches and programs developed over the years. Since 1982, Metropolitan has provided incentives to its member agencies to develop local projects through the LRP. Local stormwater capture projects currently are not funded through the LRP in part due to the need to have a better understanding of the connection between captured stormwater and yield.

In 2018, the SCWC published a white paper that detailed benefits and challenges associated with stormwater development. Although stormwater projects deliver multiple benefits, such as supply yield, flood mitigation, habitat creation, and water quality improvements, some of the main challenges with developing stormwater projects are related to costs, metering, data collection, and water supply yield. The relationship between stormwater capture and yield has not been extensively analyzed. In addition, most projects do not demonstrate a direct link to increased groundwater production or yield. This limits the ability to fully characterize stormwater capture project costs or to quantify the water supply benefit.

To better understand the actual costs and potential benefits associated with stormwater capture, yield, and reuse, Metropolitan developed two Stormwater Pilot Programs. The Direct Use Pilot Program aims to develop costs and benefits associated with capture and direct reuse of stormwater. Under this pilot, projects are required to capture stormwater onsite or through storm drain diversion. In addition, projects must meter both captured and reused stormwater. The Recharge Pilot Program was initiated to further examine the relationship between stormwater capture and yield. The Recharge Pilot requires participants to measure both stormwater capture and how much of the captured water reaches the primary pumping and subsequently allows for increased groundwater production or yield. Proposed methods for measuring how stored water recharges the primary pumping aquifers must use at least one physical method and one modeling method. This pilot will help collect data to better understand how stormwater recharge affects usable groundwater. Both pilots provide funding for new construction and installation of monitoring equipment. Additionally, both pilots provide funding for collecting three years of monitoring data. The Direct Use Pilot launched in January of 2020 with a $5.0 million budget, while the Recharge Pilot launched shortly after in March 2020, with a budget of $7.5 million.

The data collected from the pilot programs will provide a better understanding of stormwater projects and their performance. Providing funding to offset construction and monitoring costs alleviates a key constraint in project development and the ability to quantify stormwater volumes. Furthermore, the data collected from the pilot programs will help evaluate the water supply benefits delivered by stormwater projects and provide a basis for potential future funding approaches.

Regional Recycled Water Program

The Regional Recycled Water Program, a partnership with the Los Angeles County Sanitation Districts, will purify wastewater that currently flows to the ocean to produce high quality water that could be used again. On November 10, 2015, Metropolitan's Board authorized Metropolitan to enter into an agreement with the Sanitation Districts to implement a demonstration-scale recycled water treatment plant and to establish the framework of terms and conditions for development of a regional recycled water supply program. Under this agreement, Metropolitan has the opportunity to work collaboratively with the Sanitation Districts to develop a potential regional recycled water supply program that would purify and reuse water. Metropolitan and the Sanitation Districts would jointly develop this program to purify effluent from the Sanitation Districts' Joint Water Pollution Control Plant (JWPCP) using advanced treatment technologies to produce water that is near-distilled in quality and that would be equal to or better than the quality of water currently used to replenish groundwater basins in the Southern California region. The purified water would be delivered to Metropolitan's member agencies to meet their groundwater replenishment and storage requirements. A collaboration between the two districts could advance the reuse of water at a scale, timing, and strategic location to serve the direct needs of multiple member agencies for recharge of groundwater basins in Southern California, and to augment regional supplies for Metropolitan's service area. In addition, with the development of regulations for raw water augmentation, purified water may eventually be blended with imported supplies at Metropolitan's treatment plants and delivered to additional member agencies.

In October 2019, the agencies began operating the Regional Recycled Water Advanced Purification Center, a 0.5 million gallon per day demonstration facility. The facility will generate information needed for the potential future construction of a full-scale advanced water plant. It uses a unique application of membrane bioreactors designed to significantly increase efficiency in water recycling. Scientists and engineers will test the process, utilizing full-scale treatment modules, to ensure the resulting purified water meets the highest water quality standards. Once approved by regulators, this innovative process could be used throughout California and even applied around the globe. Following approval, additional treatment trains will be tested to determine the needed purification processes for a full-scale program.

The full-scale regional RRWP would produce up to 150 million gallons daily, enough to serve more than 500,000 homes. Purified water from the advanced treatment facility would be delivered through 60 miles of new pipelines to the region's groundwater basins, industrial facilities, and potentially two of Metropolitan's treatment plants. Metropolitan prepared feasibility analyses for the RRWP (the Feasibility Study, Report No. 1530) in November 2016 and Conceptual Planning Studies Report (Report 1618, February 21, 2019) in preparation for environmental review and preliminary design. Letters of intent have also been executed with key partners.

In November 2020, Metropolitan's Board of Directors approved the next phase of the program, environmental planning. In addition, the Board also approved an updated agreement with the Sanitation Districts, which further expands the partnership and allows for additional shared responsibilities and resources.

Future Supply Actions

Metropolitan supports the development of local supplies through the FSA Funding Program. FSA are low cost, low risk investments Metropolitan can take now to remove barriers to new supplies so that they can be accelerated in the future, if when needed. The FSA Funding Program is Metropolitan's primary vehicle for promoting innovative new approaches to local supply development. Under the FSA Funding Program, Metropolitan funds member agency studies addressing development challenges for groundwater, recycled water, stormwater and seawater desalination supplies. The goals of the FSA Funding Program include:

- Reduce barriers to future resource production
- Provide results that are unique, yet transferable to other areas in the region
- Advance the field of knowledge
- Represent a critical path to water resource implementation

Metropolitan implemented an initial round of FSA funding in 2013 and launched a second round of funding in 2019. Both rounds have funded a mix of white papers, pilot tests and demonstration studies. The program funds a maximum of $500,000 per study or per agency. In 2018, Metropolitan also co-funded six potable reuse projects and one agricultural reuse study under the FSA Funding Program with the Water Research Foundation. Metropolitan's nearly $1.0 million in co-funding supports WRF's $8.0 million Advancing Potable Reuse Initiative and helped match $4.5 million in State Water Resource Control Board grant funds. Table 3-12 provides a summary of the FSA funding.

Table 3-12
Summary of FSA Funding

	2013 FSA Member Agency Studies		2018 FSA Member Agency Studies		2018 WRF Potable Reuse Studies	
	Studies	**Funding**	**Studies**	**Funding**	**Studies**	**Funding**
Groundwater	4	$900,000	3	$661,000		
Recycled Water	5	$810,000	5	$1,265,000	7	$975,000
Stormwater	2	$814,000	4	865,000		
Seawater Desalination	2	$325,000	2	$365,000		
Total Funding	**13**	**$2,939,000**	**14**	**$3,156,000**	**7**	**$975,000**

Metropolitan also supports local supply development as a regional facilitator for seawater desalination and related resource issues. This includes assisting member agencies with technical issues, supporting member agency projects during permit hearings, coordinating responses to proposed regulations, and collaborating with the member agencies to address development challenges. Metropolitan helped launch and now participates in CalDesal, a consortium of water utility and private stakeholders promoting desalination as an element of California's future supply portfolio.

Achievements to Date

Metropolitan has continued to develop and refine its programs to encourage the involvement of its member agencies in water recycling, groundwater recovery, and desalination. Developing and managing these programs requires considerable coordination and refinement. Changing conditions over the last five years have reduced the costs of these options and allow Metropolitan to rely on these sources for future water supply.

Table 3-13 provides a summary of the status of local agency seawater desalination projects that are under development within Metropolitan's service area. Local agencies are considering several projects with the potential to produce up to 131 TAF, if developed.

Metropolitan is committed to providing financial assistance to the development of water recycling projects throughout its service area. Since 1982, Metropolitan has executed LRP contracts for 85 recycled water projects, 75 of which produced about 138 TAF in 2019. Local projects not receiving funding from Metropolitan provide an additional 370 TAF of recycled water to the region.

Since 1991, Metropolitan has executed GRP and LRP contracts for 27 recovered groundwater projects, 24 of which produced about 50 TAF in 2019. In addition to the projects under

Metropolitan's programs, about 62 TAF of degraded groundwater is recovered by agencies in Metropolitan's service area without Metropolitan's financial assistance.

Table 3-14 provides a summary of recycled water use and groundwater recovery in FY 2019-20. To date, Metropolitan has invested $510 million in recycling programs and $173 million for groundwater recovery. Table 3-15 provides a summary of the groundwater and recycled water production and incentive payments under Metropolitan's programs to date.

Table 3-13
Seawater Desalination Projects Under Development within Metropolitan's Service Area[1]

Project	Member Agency Service Area	Planned Capacity AF per Year	Status as of September 2020
Huntington Beach Seawater Desalination Project	Orange County Water District / Municipal Water District of Southern California	56,000	Permitting
West Basin Ocean Desalination Project	West Basin Municipal Water District	20,000 to 60,000	Environmental Impact Report
Doheny Desalination Project	South Coast Water District / Municipal Water District of Orange County	5,000 to 15,000	Permitting

3.6 Surface Storage and Groundwater Management Programs: Within the Region

Since the 1950s, local water management in Metropolitan's service area has included the surface water storage and conjunctive use of groundwater. Conjunctive use of water refers to the use and storage of imported surface water supplies in groundwater basins and reservoirs during periods of abundance. This stored water is available for use during periods of low surface water supplies as a way of augmenting seasonal and multiyear shortages.

Background

Metropolitan established general long-term storage guidelines in its Water Surplus and Drought Management (WSDM) Plan. The WSDM Plan provides for flexibility during dry years, allowing Metropolitan to use storage for managing water quality, hydrology, SWP, and Colorado River issues. Dry-year surface storage yields have been characterized in several ways, including delivery capabilities over two- and three-year dry periods. The approach used in Metropolitan's resource planning assumes that dry-year surface storage can be used as needed and as available within the WSDM planning framework. In addition to surface reservoirs in the region, storage capacity in the region's groundwater basins allows for conjunctive use programs. In 2000, the Association of Ground Water Agencies (AGWA) published Groundwater and Surface Water in Southern California: A Guide to Conjunctive Use that estimated the potential for dry-year or long-term conjunctive use in Metropolitan's service area at approximately 4.0 MAF. In 2007, Metropolitan published the Groundwater Assessment Study that estimated 3.2 MAF of space in groundwater basins available for storage within Metropolitan's service area. Metropolitan's 1996 IRP calls for the development of conjunctive use programs with member agencies and groundwater basin managers to store surplus imported supplies in wet years to provide dry-year supplies.

To prepare for supply disruptions, Metropolitan and its member agencies have adopted goals for water storage within the region. Metropolitan has identified in-region storage that should be set aside for use in emergencies, such as a disruption to imported supplies due to a major seismic event at the San Andreas Fault.

Implementation Approach

Surface Storage

Since the beginning of Metropolitan's planning process, two significant changes have occurred to regional surface storage: (1) the construction of DVL, and (2) Metropolitan receiving operational control of 218,940 AF in Castaic Lake and Lake Perris.

<u>Diamond Valley Lake</u>

Construction of Southern California's newest and largest reservoir nearly doubled the area's surface water storage capacity. Transport of imported water to the lake began in November 1999, and the lake reached capacity in early 2003. DVL holds up to 810 TAF, some of which is for dry-year or seasonal storage, and the remainder for emergency storage.

<u>SWP Terminal Reservoirs</u>

Under the 1994 Monterey Agreement and Amendment, Metropolitan is permitted to withdraw up to 218,940 AF in the reservoirs at the southern terminals of the California Aqueduct. Access to this storage capacity in Castaic Lake (153,940 AF) and Lake Perris (65,000 AF) gives Metropolitan greater flexibility in handling supply shortages. Any amount of water withdrawn in a year must be replaced with supplies available to Metropolitan within five years.

Groundwater Storage

Many local groundwater storage programs have been implemented over the years to maximize the use of local water supplies. These programs have included the diversion of water flows into percolation ponds for recharging groundwater basins and the recovery of degraded groundwater.

- For many years, flood control agencies within Metropolitan's service area have captured and spread stormwater for groundwater replenishment. Local runoff and reclaimed water have been conserved via spreading grounds, injection wells, reservoirs, and unlined river channels. In addition, flood control agencies have operated seawater barrier projects in Los Angeles and Orange Counties to prevent seawater intrusion into the coastal groundwater basins.
- Water quality issues have raised serious concerns about the ability to sustain average annual production levels in some groundwater basins. For example, recently recognized threats to groundwater basins posed by emerging contaminants such as per- and polyfluoroalkyl substances (PFAS) have affected groundwater production in many areas. Groundwater levels have been augmented by groundwater water recovery projects discussed in Section 3.5.

Conjunctive use of the aquifers offers an important source of dry year supplies. Unused storage in Southern California groundwater basins can be used to optimize imported water supplies, and the development of groundwater storage projects allows effective management and regulation of the region's major imported supplies from the Colorado River and SWP. Over the years, Metropolitan has implemented conjunctive use through various programs. Typically, this storage takes place in one of two ways:

- Direct deliveries to storage – Metropolitan delivers recharge water directly to water storage facilities, including spreading sites and injection wells.
- In-lieu deliveries to storage – Metropolitan delivers water directly to a member agency's distribution system for use by the member agency rather than, or in-lieu of, pumping the groundwater it otherwise would have taken out of storage. The deferred local production results in water being left in local storage (surface or groundwater) for future use.

Metropolitan has developed a number of local programs to work with its member agencies to increase stored water in groundwater basins through conjunctive use. Conjunctive use agreements provide for storage of imported water that can be called for use by Metropolitan during dry, drought, or emergency conditions. During a dry period, Metropolitan has the option to call water stored in the groundwater basins pursuant to its contractual conjunctive use agreements. At the time of the call, the member agency pays Metropolitan the prevailing rate for that water. Metropolitan has drawn on dry-year supply from nine contractual conjunctive use storage programs to address shortages from the SWP and the Colorado River.

Metropolitan has also made use of the basins to manage its water supply resources through programs such as its cyclic agreements. Cyclic programs allow Metropolitan to deliver water into groundwater basin or surface water reservoir before the agency has a demand for water. Advanced deliveries allow Metropolitan to manage high-supply availability when its own storage capacity is limited. The member agency purchases the delivered water based on a long-term schedule agreed by the parties. Although cyclic programs do not hold stored water for Metropolitan, they provide water resource management flexibility, especially when storage capacity is restricted.

Achievements to Date

In 2000, Metropolitan entered an agreement with DWR to administer $45 million of Proposition 13 state bond funds for Metropolitan's Southern California Water Supply Reliability Projects Program. Metropolitan paired the $45 million of state funds with $35 million of Metropolitan capital funds to develop nine groundwater storage programs in partnership with member and retail agencies and groundwater basin managers. These nine contractual storage programs have an initial 25-year term and provide for storage of up to 212 TAF and dry-year yield of up to 70 TAF. These programs are summarized in Table 3-16. Since inception, the conjunctive use program has been exercised to store water in groundwater basins during wet periods and relied upon to extract that water during dry periods. For example, during the recent drought period from 2012 to 2016, the conjunctive use program provided 64,000 AF of dry year supply to help Metropolitan meet regional demands. As of January 2020, the conjunctive use storage balance is 61,000 AF.

In 2007, Metropolitan prepared the Groundwater Assessment Study Report in collaboration with its member agencies and with groundwater basin managers. The report finds that while there is substantial storage space in service area groundwater basins that could be used for conjunctive use, there are significant challenges that must be overcome in order to implement additional storage programs. Use of additional storage opportunity requires:

- Capture, delivery, and recharge of additional local and imported surface supplies;
- Improved capability to store available surplus surface supplies with adequate conveyance and recharge capacity; and
- Resolution of constraints including: remediation of contamination, institutional and legal issues, funding for significant investment in capital infrastructure, and incongruity between aquifer capability with overlying demand for water supplies.

To follow up on the findings of the Groundwater Assessment Study Report, Metropolitan initiated a series of seven groundwater workshops beginning in July 2008 among Metropolitan, member agencies, groundwater basin managers, and stakeholders to discuss challenges for increasing conjunctive use and to develop recommendations for addressing the challenges. The workgroup's recommendations were submitted as a Board Report to Metropolitan's Board of Directors and provided as input to Metropolitan's current planning process. The recommendations are as follows:

1. Enhance groundwater replenishment with increased stormwater, recycled water, and imported water recharge.
2. Streamline requirements, remove policy constraints, clarify procedures, increase coordination and sharing of information to accomplish recharge goals.
3. Develop flexible regional policies and programs that can be tailored to meet specific local needs of each groundwater basin.
4. Increase integration of local groundwater and regional water supplies with a proposal for a comprehensive modeling study to initiate review of innovative opportunities.
5. Use appropriate price signals to encourage conjunctive use and investments for storage.
6. Increase coordination among Metropolitan, member agencies, basin managers, groundwater producers, and stakeholders inclusive of collaboration for legislative, regulatory, and educational efforts in support of specific initiatives and funding needed for sound groundwater management.

Metropolitan has given updates of the Groundwater Assessment Study to the Board in 2011, 2015, and 2018.

Since 2013, Metropolitan has also been working with the SCWC Stormwater Task Force to evaluate the feasibility of further supporting groundwater production with increases in stormwater capture for groundwater replenishment. Metropolitan remains actively involved in the SCWC Stormwater Task Force. In 2019, the Stormwater Task Force developed a white paper that discussed innovative project implementation and enhanced operation and maintenance strategies. Metropolitan staff gave a presentation on the stormwater pilot program at the annual workshop on September 27, 2019. The workshop brought together more than 200 participants, including local agencies, regional planners, and non-government agencies for a discussion on regional stormwater issues. In 2020, due to the global pandemic, the Stormwater Task Force hosted a series of short informational webinars related to water resources development and innovative stormwater projects.

3.7 Water Use Reduction

In November 2009, Governor Arnold Schwarzenegger signed the Water Conservation Act of 2009 (SB X7-7) into law as part of the historic comprehensive water package designed to address the State's growing water challenges. The Act represented the culmination of efforts by water industry leaders (including Metropolitan), the environmental community, and the Legislature to enact legislation that would answer the governor's call for the state to reduce per capita water use 20 percent by the year 2020 (referred to as "20x2020") as part of a larger effort to ensure reliable water supplies for future generations and restore the Bay-Delta.

The 20x2020 legislation requires urban retail water suppliers to develop urban water use targets to help meet the 20 percent reduction in water use by 2020, with interim targets for 2015. The legislation provides flexibility in how targets are established and achieved. Per capita reductions can be accomplished through any combination of increased water conservation, improved water use efficiency, and increased use of recycled water to offset potable demand. Potable demand offsets can occur through direct reuse of recycled water, such as for irrigation, or IPR through groundwater replenishment and reservoir water augmentation. Retail water suppliers receive partial credit for past efforts in conservation and recycled water; therefore, not all agencies need to reduce demand by 20 percent in order to comply with the law.

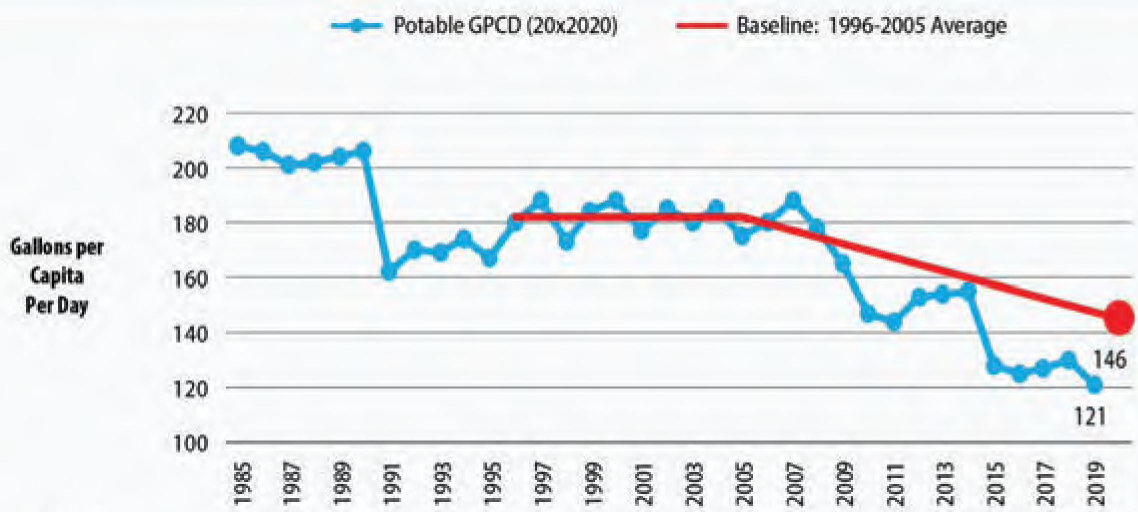
Achievement as of 2020

As a wholesale water agency, Metropolitan is not required to establish or report an urban water use reduction target. However, Metropolitan's regional conservation programs and local resource programs are designed to assist member agencies and retail water suppliers in the service area to comply with SB X7-7. These programs are described in Sections 3.4 and 3.5. Therefore, Metropolitan monitors the progress of its service area.

Based on an analysis of population, demand, and the methodologies for setting targets described in the legislation, Metropolitan's baseline per capita water use is 182 GPCD and the 2020 reduction target is 146 GPCD. From 2011 to 2014, there was a slight increase in per capita water use explained in part by continued economic recovery and drier weather as compared to previous years. With mandatory restrictions from the state and water supply allocation from Metropolitan, Metropolitan's 2015 UWMP reported an interim water use reduction achievement of 131 gallons per capita per day (GPCD), which is a 28 percent reduction from the baseline.

Over the last five years, Metropolitan continued to provide support for retail agency water use reduction efforts through technical assistance, legislation, code and standards updates, and financial incentives where needed to increase water use efficiency. Based on best available data as of January 2021, Metropolitan estimates a 2019 per capita water use of 121 GCPD, well exceeding Metropolitan's 2020 water use target of 146 GPCD with a 34 percent reduction from the baseline of 182 GPCD.

Figure 3-4 Potable Per Capita Water Use: 20% Reduction by 2020
Metropolitan's Service Area (Calendar Year)



Notes:

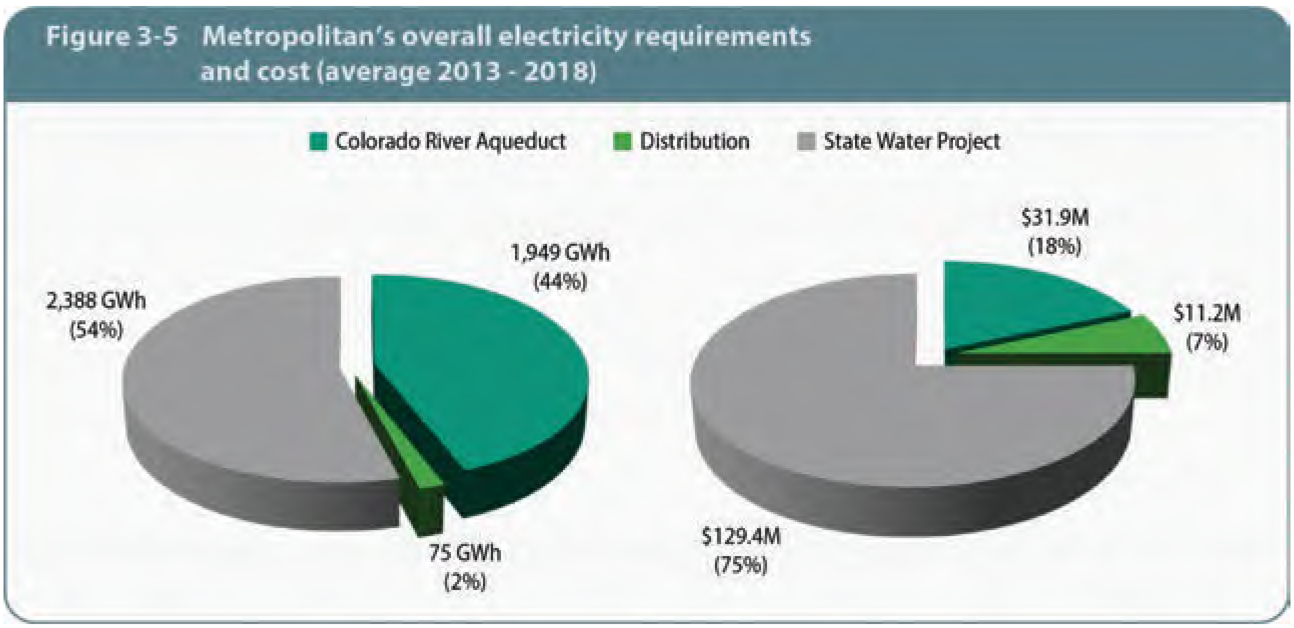
1. Calendar year data.
2. 2019 GPCD based on best available data as of January 2021 and is subject to change.
3. Baseline per capita water use based on 1996-2005 average (182 GPCD).
4. Target GPCD for 2020 based on 20% reduction from baseline (146 GPCD).

3.8 Energy Management Initiative

Metropolitan's mission is to provide its service area with an adequate and reliable supply of high-quality water to meet present and future needs in an environmentally and economically responsible way. The conveyance, treatment, and distribution of water is an energy-intensive and energy-dependent process, and as such, Metropolitan has goals of controlling operational costs and conserving valuable natural resources.

Metropolitan's net energy use and costs are dominated by the pumping (transport) required to import water via the Colorado River Aqueduct (CRA) and State Water Project (SWP) systems (Figure 3-5). Given that Metropolitan does not have direct control over operations of the SWP, its energy strategy focuses exclusively on the energy use and cost for CRA operations (wholesale power) and for Metropolitan's distribution, treatment, and office facilities (retail power), which on average total $43.1 million per year.

Figure 3-5
Metropolitan's overall electricity requirements and cost (average 2013-2018)



Over the past several decades, Metropolitan has implemented many energy initiatives that have reduced energy costs and use, while diversifying its energy portfolio. These have included 130 megawatts (MW) of small hydropower generating facilities, 5.5 MW of solar power generation installations[7], and a 50-year agreement executed in 2017 to receive low-cost carbon-free hydropower from Hoover Dam for CRA operations. Despite these efforts, external factors have resulted in increased energy costs. Five major drivers influence the future energy market and Metropolitan's corresponding energy sustainability strategy, including:

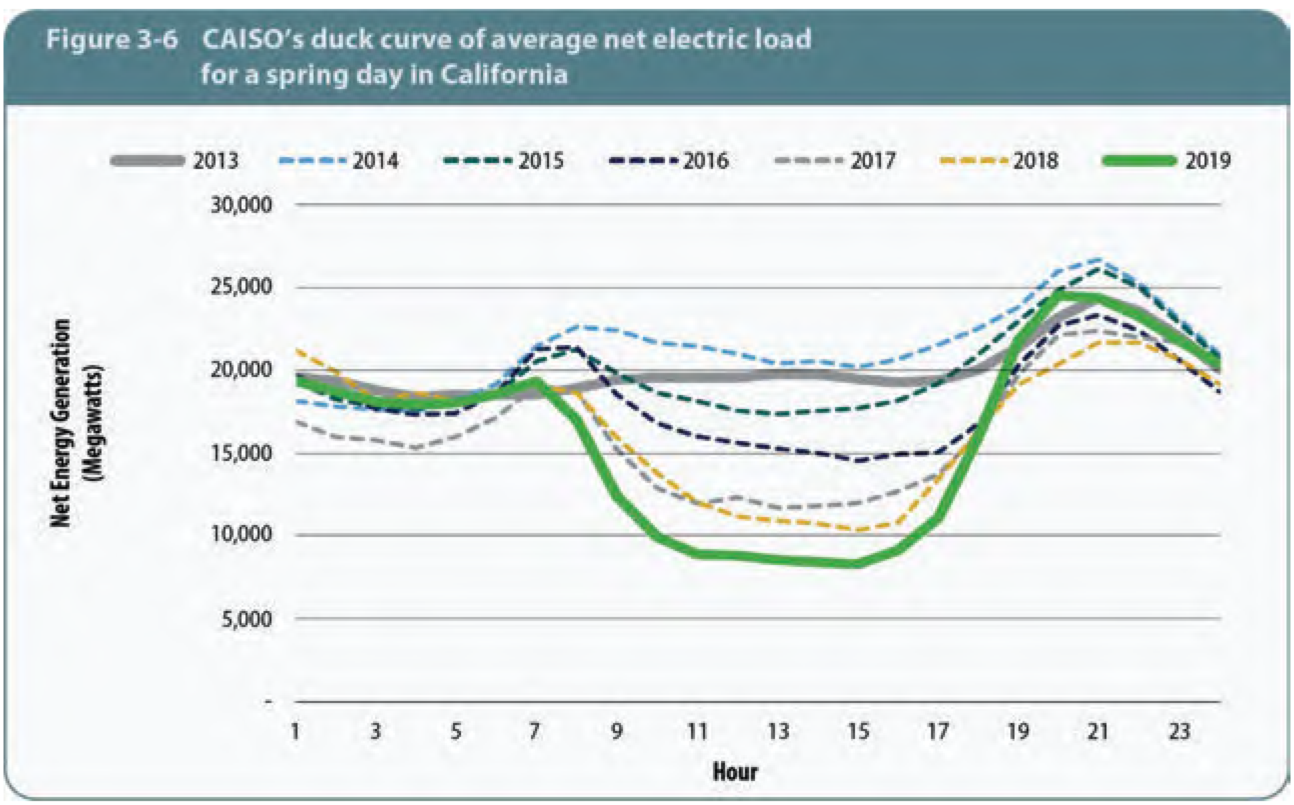
- *Progression of environmental regulations*. California is leading the nation with energy and environmental policy initiatives that are driving electrical grid changes. In particular, California's shift to renewables and carbon-free energy by 2045 (Senate Bill 100) is a primary

[7] This includes 5 MW of solar power capacity located at three of Metropolitan's treatment plants and 0.5 MW located at Diamond Valley Lake.

driver in future energy dynamics and will impact both the cost and volatility of energy markets.

- *Energy market pricing uncertainty*. Approximately 50 to 85 percent of Metropolitan's energy for CRA pumping is supplied from low-cost federal hydropower, and the balance is supplied from supplemental purchases of wholesale energy from the market. The adoption of recent policies and state goals in greenhouse gas (GHG) emission reductions and environmental protection are fundamentally changing the wholesale electric grid and its operation. The high penetration of renewable generation across the state resulted in the "duck curve" effect which has shifted peak prices from periods when demand is highest (typically midday) to periods in which solar generation declines (typically evening hours) (CAISO load minus solar generation is shown in Figure 3-6). In certain times of the year, a significant net load increase occurs when solar generation decreases at the end of the day. This increase must be mitigated by conventional fossil fired energy generators. This effect also creates over-generation during the middle of the day, which produces a "belly" appearance, and a steep ramp for fossil fuel generators during the late afternoon and evening, creating an "arch." The consequent changes in wholesale and retail energy price and structures are impacting hourly energy costs and operations at Metropolitan.

Figure 3-6
CAISO's duck curve of average net electric load for a spring day in California



Source: IEA, 2019

- *Grid reliability.* California has historically depended on fossil-fired generation to provide for the bulk of its energy needs, as well as peaking capacity and operating reserves to balance the system and compensate for system contingencies. The state's environmental policies to reduce fossil generation emissions and cooling water impacts have and will continue to result in the retirement of fossil generation throughout the state and the region. The transition to renewable, non-emitting generation creates challenges for grid operators without the traditional sources of on-demand, fast-ramping capacity.
- *Climate change and natural disasters.* Natural disasters and a changing climate pose substantial risks to the availability and price of energy for Metropolitan. While the timing and extent of these events are unpredictable, their effects can be anticipated and estimated. The main challenge for Metropolitan and its energy providers will be to develop and nimbly execute energy management initiatives that preserve a high degree of long-term flexibility and stable costs.
- *Technological advances and incentives.* New technological advancements and improved practices in the renewable energy and energy storage sectors provide viable options for Metropolitan's long-term energy management goals. For example, energy storage systems are able to capture the energy generated by renewables and store it until the energy is needed. Energy storage can address the power intermittency challenges from renewables and effectively increase utility resiliency and reliability. Several incentive and credit programs are also available, such as the California Public Utilities Commission Self-Generation Incentive Program, to further improve the economic feasibility of battery energy storage projects.

The evolution in California's energy mix and resulting uncertainty in the reliability and cost of energy supplies affect the affordability and reliability of Metropolitan's water supply operations. Metropolitan's review of its energy strategies, practices and projects is an important step to help position itself as a leader in energy sustainability.

In 2020, Metropolitan developed a new Energy Sustainability Plan (ESP) and an updated implementation roadmap, to formulate actions and strategies that best position Metropolitan to adapt to future wholesale and retail energy market changes for its CRA operations and conveyance and distribution system. The ESP's purpose is to foster informed energy management decisions through a framework of sustainable actions focused on energy cost containment, reliability, affordability, conservation and adaptation – now and into the future.

The ESP incorporates an adaptive energy management strategy and project implementation roadmap resulting in projects and initiatives that:

- Contain costs and reduce Metropolitan's exposure to energy price volatility
- Increase operational reliability and flexibility
- Move Metropolitan towards energy independence and sustainability
- Support Metropolitan's Climate Action Plan (CAP) effort to meet proposed GHG emissions reduction targets

Metropolitan's adaptive energy management strategy addresses issues surrounding energy management and cost mitigation. The energy strategy roadmap addresses near- to long-term energy issues and achieves Metropolitan's overarching goals by including projects that address both retail and wholesale energy markets, and energy management best practices. The recommended actions are impacted by numerous factors, considered as indicators in this plan, that will signal the acceleration or change of course for certain actions. The magnitude, nature, and timing of these signals will result in different responses and actions for Metropolitan in the long-term and will be continuously monitored over time.

Selected near-term actions (1-3 years) identified are:

- Implement reconfiguration of the Yorba Linda Power Plant feed to serve the Diemer water treatment plant (WTP) retail load behind the Southern California Edison meter.
- Implement battery storage projects at the Weymouth, Skinner, Jensen, and Mills WTPs and the OC-88 Pumping Plant.
- Evaluate implementation of islanded operations using battery storage for possible future microgrid operations.
- Monitor wholesale energy market developments for major changes to CRA energy costs and evaluate appropriate options, such as generation or energy storage.
- Assess pump modifications at Intake and Gene pumping plants to implement targeted application of variable-speed pump drives.
- Continue to monitor third-party developer projects for opportunities in retail and large-scale wholesale renewable energy and energy storage opportunities.

Metropolitan has made progress on two near-term actions. This includes initiating projects for battery storage at the Skinner, Jensen, and Weymouth treatment plants, as well as OC-88. To support implementation, Metropolitan has applied for $10.3 million in state incentives for these projects. The battery storage facilities will be configured as microgrids to optimize on-site solar generation and increase energy resilience.

Selected mid-term actions (4-7 years) include:

- Assess the performance of implemented Battery Energy Storage System projects and later implement the previously deferred project options based on first phase performance results.
- Implement renewable energy and/or energy storage projects with third-party developers, if determined feasible.
- Continue evaluating low/no carbon power for CRA pumping operations to hedge against rising carbon prices.
- Reevaluate small hydropower opportunities within the distribution system if project economics become favorable.

Metropolitan engages in several energy best practices to reduce Metropolitan's overall energy consumption. These practices focus on energy auditing, monitoring and benchmarking, cost optimization of process and pumping operations, energy efficient design and rehabilitation measures, and providing staff training and communication strategies for energy management. Energy efficiency opportunities that reduce energy usage are evaluated on a continuous basis for short- and long-term benefits to help reduce energy-related costs and GHG emissions.

Long-term planning over the next 10 years will adapt relevant actions and strategies to current conditions. The key goal for Metropolitan's long-term energy management plan is to continuously update the ESP, monitor implemented projects and initiatives, reassess the main market drivers to better understand potential project and energy management opportunities, and adjust the ESP and roadmap accordingly.

The framework is intended to be flexible by accommodating future projects, preferences, and localized needs, and to be adaptable as Metropolitan's goals and technology evolve. The roadmap provides a plan for implementation of the recommended energy projects and initiatives, while accounting for changes in the future. Signals assigned to each action will be monitored over time by Metropolitan staff to indicate when these actions and their economic and operational benefits can serve Metropolitan's needs.

Climate Action Plan

In 2016, California signed into law the country's most stringent GHG reduction target of 40 percent below 1990 levels by the year 2030, as well as a long-term goal of 80 percent below 1990 levels by 2050. In 2017, then Governor Brown signed EO B-55-18, which set an even more progressive long-term goal of carbon neutrality by 2045. While the state has not imposed specific GHG reduction requirements for public water agencies, its 2017 Climate Change Scoping Plan suggests that water agencies should move towards low carbon or net-zero carbon water management systems.

To help California achieve this ambitious goal, Metropolitan is in the process of developing its first ever Climate Action Plan (CAP), which will serve as a road map for reducing greenhouse gas (GHG) emissions from its operations and future construction projects. The CAP will meet the goals of the state by identifying and implementing a number of actions that will reduce Metropolitan's future GHG emissions. In addition, it will serve as a vehicle to streamline project evaluation of GHG impacts under the California Environmental Quality Act (CEQA Guidelines § 15183.5(b) Plans for Reduction of Greenhouse Gas Emissions). The CAP will include the following elements:

- A complete inventory of GHG emissions, both existing and projected
- A GHG reduction target aligned with state goals
- A strategy to reduce emissions to meet the GHG reduction target
- A plan to monitor and verify results
- Adoption of the plan in a public process

Emissions Inventory

Using standard accounting protocols from The Climate Registry (TCR)[8] and the International Council for Local Environmental Initiatives (ICLEI)[9], Metropolitan completed an emissions inventory of three source categories or scopes related to the operational control the organization has over the emission source.

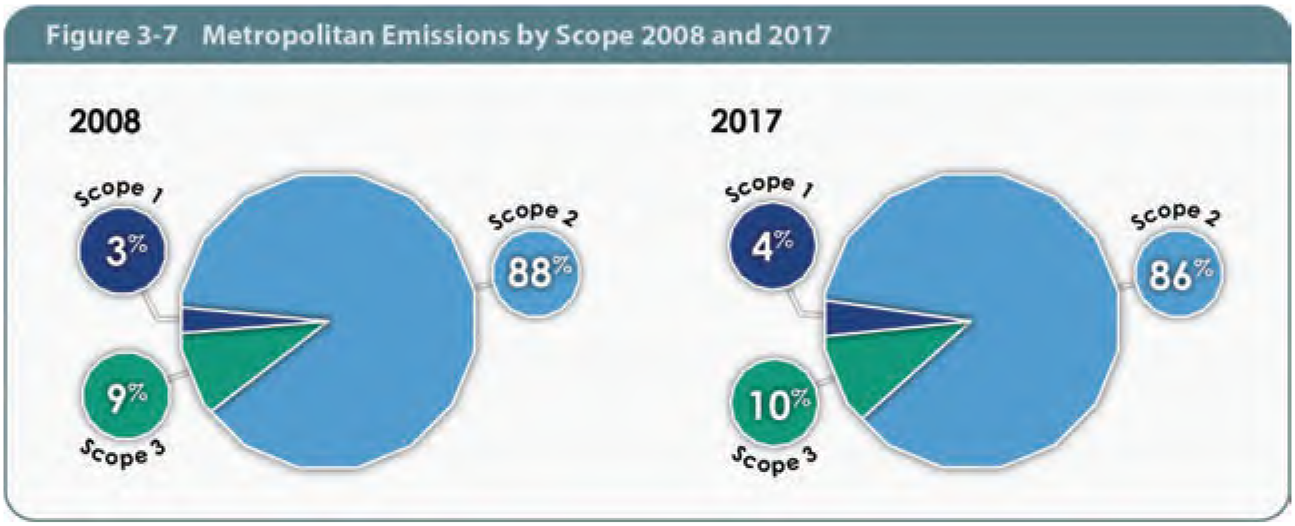
- Scope 1 emissions consist of direct GHG emissions associated with fuel use, such as emissions from gasoline and diesel consumption by Metropolitan's vehicle fleet, propane and natural gas use at its facilities, and unintended fugitive emissions[10].
- Scope 2 emissions consist of indirect GHG emissions associated with the purchase and consumption of electricity used primarily for the transmission, treatment and distribution of water. Scope 2 also includes electricity transmission and distribution losses.

[8] The Climate Registry. https://www.theclimateregistry.org/tools-resources/reporting-protocols/general-reporting-protocol/. Metropolitan's reported GHG emissions to The Climate Registry are shown in Appendix 10.
[9] ICLEI. 2010. Local Government Operations Protocol. http://icleiusa.org/ghg-protocols/.
[10] Fugitive emissions are emissions of gases or vapors from industrial equipment due to leaks or other unintended releases.

- Scope 3 emissions consist of other indirect GHG emissions not captured in Scope 1 or 2, such as those associated with employee commutes, waste generation, water consumption occurring at Metropolitan facilities, and emissions associated with construction projects.

Figure 3-7 illustrates the Metropolitan emissions by scope for calendar years 2008 and 2017.

Figure 3-7
Metropolitan Emissions by Scope 2008 and 2017.



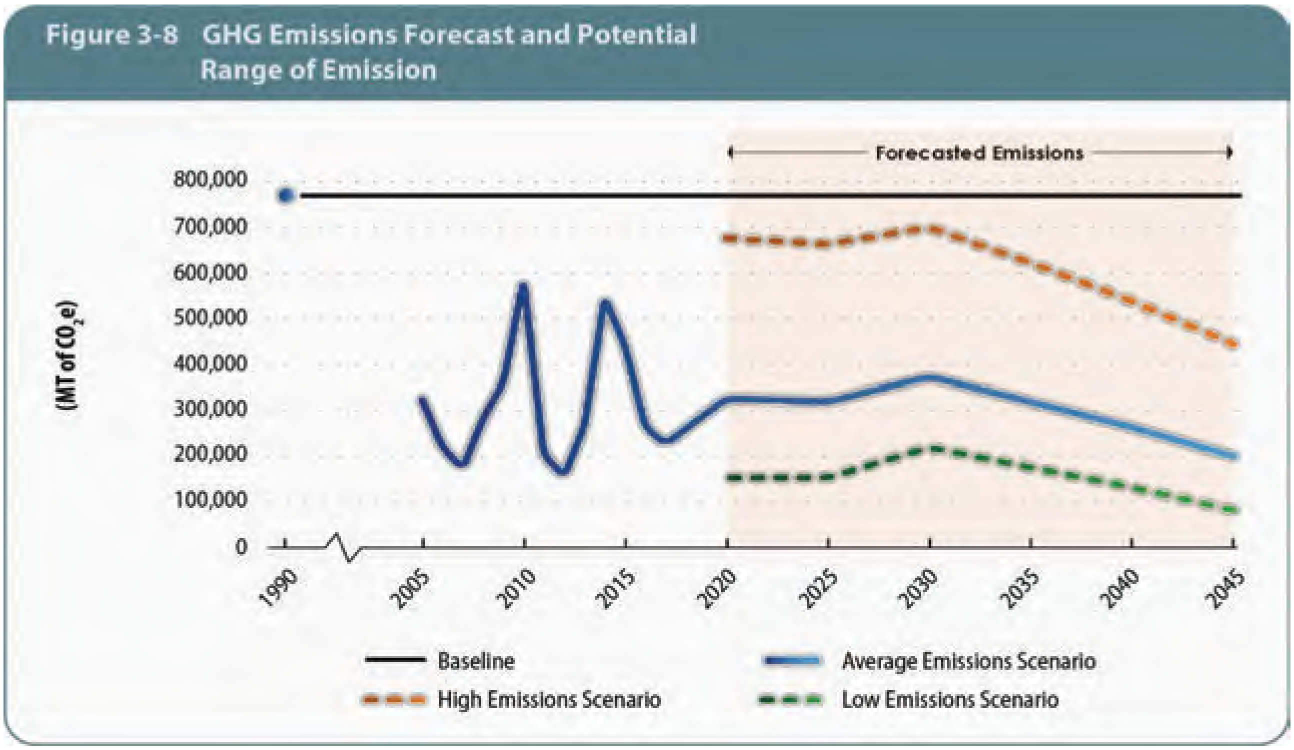
Emissions Forecast

In order to estimate the level of GHG emissions reductions necessary for Metropolitan to achieve its selected GHG reduction target and be consistent with the requirements for a qualified GHG emissions reduction plan, an emissions forecast was prepared based on Metropolitan projected energy demand and energy sources, the anticipated impact of future Metropolitan projects, the anticipated impact of existing energy efficiency and GHG reduction programs, and regional population growth assumptions.

As noted above, Metropolitan does not have direct control over operations of the SWP. Thus, Metropolitan's strategy focuses exclusively on reducing the GHG emissions associated with operation of the CRA, and operation and maintenance of Metropolitan's distribution, treatment, and office facilities. Water deliveries from the CRA require substantial electricity usage, as the water must be pumped up a total lift of 1,614 feet from the Colorado River before flowing by gravity into Metropolitan's distribution system.

CRA water deliveries vary significantly year-to-year based on water needs, rainfall, and availability of water from the SWP. To account for this variability in electricity use and related GHG emissions, three forecast scenarios were modeled to estimate the range of GHG emissions that will need to be reduced to reach Metropolitan's adopted GHG reduction target. A high emissions scenario represents a worst case scenario with extended drought and maximum pumping capacity from the CRA, an average emissions scenario is modelled by averaging pumping data from 2008 through 2017, and a low emissions scenario represents Metropolitan's lowest single year CRA pumping from 2008 through 2017 and high deliveries from the SWP. The results of the potential range of emission that will need to be offset in future years is shown in Figure 3-8. Baseline emissions for 1990 were estimated using the best available data. It is important to note that in all projections, GHG emissions taper off as a result of new California regulations that require all retail energy sold in California to be from 100 percent carbon-free energy by 2045.

Figure 3-8
GHG Emissions Forecast and Potential Range of Emission



GHG Reduction Target

Metropolitan is committed to achieving the state's GHG reduction goals. Therefore, Metropolitan has set its GHG reduction target to be consistent with the state target of 40 percent below 1990 levels by 2030. In addition, Metropolitan is committing to achieving net carbon neutrality by 2045. Metropolitan is well-situated to meet this goal.

Strategy to Meet GHG Reduction Goals

In conjunction with Metropolitan's Energy Management Initiative described above, a number of projects have been identified that will not only ensure Metropolitan's energy reliability, but also further Metropolitan's efforts to reach carbon neutrality by 2045, including developing solar and battery storage facilities, negotiating wholesale carbon-free energy contracts, improving pump efficiency, purchasing zero emission fleet vehicles, and implementing waste recycling techniques. Metropolitan may also leverage extensive land holdings to implement potential carbon sequestration programs that could generate carbon credits. Additional actions will depend on many variables that are not yet quantified, such as the rate of energy storage deployed by the State of California and its utilities, the cost of renewable energy, and the costs associated with infrastructure. Not only do many of these projects ensure energy reliability and reduce GHG emissions, but they may also provide a substantial net cost savings to Metropolitan through reduced energy costs and reduced costs to offset GHG emissions.

Monitoring and Reporting

Ensuring that Metropolitan is meeting its GHG reduction target is a cornerstone of an adopted GHG reduction plan. As such, Metropolitan will track its GHG emissions annually and update the CAP every five years to revise and refine the plan to capture any new measures and ensure Metropolitans is meeting its goals. Metropolitan currently reports verified GHG emissions to TCR's open and transparent GHG Registry. Appendix 10 of this plan contains additional information on Metropolitan's GHG emissions and overall energy intensity.

CAP Adoption

The CAP will be released for public review in spring 2021, with an expected Board adoption of the completed CAP in summer 2021. Metropolitan's unique emissions profile and commitment to environmental and energy sustainability ensure that it is situated to meet not only the state's adopted target of 40 percent below 1990 levels by 2030, but also the state's goal of carbon neutrality by 2045, guaranteeing that Metropolitan remains an industry leader.

Water Quality 4

Metropolitan's planning efforts recognize the importance of the quality of its water supplies. To the extent possible, Metropolitan responds to water quality concerns by protecting the quality of the source water and developing water management programs that maintain and enhance water quality. Contaminants that cannot be sufficiently controlled through protection of source waters must be handled through changed water treatment protocols or blending. These practices can increase costs and/or reduce operating flexibility. This section discusses source water quality and issues of concern affecting water management strategies and water supply reliability.

Background

Metropolitan's planning efforts for groundwater storage, recycled water, and other water management strategies require meeting specific water quality targets for imported water. Metropolitan has two major sources of water: the Colorado River and the State Water Project (SWP). Groundwater inflows are also received into the SWP through groundwater banking programs in the Central Valley. Each source has specific water quality issues, which are summarized in this section. For example, the water industry has had to respond to constituents of emerging concern (CECs). To date, Metropolitan has not identified any water quality risks that cannot be mitigated. However, based on current knowledge, a water quality issue that could potentially affect water management strategies and supply reliability in the future might be increases in the salinity of water resources. Under California's current drought conditions, decreased flows have altered Delta flow patterns and, while the effects of the drought have not been fully studied, there have been some observable changes in water quality such as increased salinity due to increased seawater intrusion. However, even under drought conditions, SWP salinity is significantly lower than Colorado River water salinity, and Metropolitan relies on blending imported water sources to mitigate for the higher salinity Colorado River water. During recent periods of drought, Metropolitan's SWP allocation has been reduced, including to a historical low of five percent in 2014 and twenty percent in 2015 and 2020, which affected blending operations. Metropolitan increased its deliveries of Colorado River water in 2014, 2015, and 2020, and subsequently, salinity in treatment plant influent increased overall from the higher Colorado River salinity levels. Metropolitan anticipates no significant reductions in water supply availability from imported sources due to water quality concerns, such as salinity, over the next five years.

Colorado River

High salinity levels remain a significant issue associated with Colorado River supplies. In addition, Metropolitan has been engaged in efforts to protect its Colorado River supplies from threats of uranium, perchlorate, and chromium-6, which are discussed later in this section. Metropolitan has also been active in efforts to protect these supplies from potential increases in nutrient loading due to agriculture and urbanization, as well as tracking the occurrence of CECs. Metropolitan fully expects its source water protection efforts to be successful, so the only foreseeable water quality constraint to the use of Colorado River water will be the need to blend (mix) it with SWP supplies to meet Metropolitan's Board-adopted salinity standards.

State Water Project

The key water quality issues for the SWP are disinfection byproduct precursors, in particular, total organic carbon, bromide, and low alkalinity. Metropolitan is working to protect the water quality of this source, but it has needed to upgrade its water treatment plants to deal adequately with disinfection byproducts. Disinfection byproducts result from total organic carbon and bromide in the source water reacting with disinfectants at the water treatment plant, and they may place some near-term restrictions on Metropolitan's ability to use SWP water. Low alkalinity water requires a higher percentage of total organic carbon removal in order to reduce disinfection byproduct formation. Metropolitan is overcoming these treatment restrictions through the use of ozone disinfection at its treatment plants, which has been implemented at all five of Metropolitan's treatment plants and blending SWP water with higher alkalinity Colorado River water. Arsenic is also of concern in some groundwater storage programs. Groundwater inflows into the California Aqueduct are managed to comply with regulations and protect downstream water quality while meeting supply targets. Additionally, nutrient levels are significantly higher in the SWP than within the Colorado River, leading to the potential for algal related concerns that can affect water management strategies. Metropolitan is engaged in efforts to protect the quality of SWP water from potential increases in nutrient loading from wastewater treatment plants.

Local Agency Supplies and Groundwater Storage

Drinking water standards for contaminants, such as arsenic, chromium-6, 1,2,3-trichloropropane, and other emerging constituents, such as per- and polyfluoroalkyl substances (PFAS), may add costs to the use of groundwater storage and may affect the availability of local agency groundwater sources. Although Metropolitan has not analyzed the direct effect of these water quality issues on local agency supply, these contaminants are not expected to significantly impact the availability of Metropolitan supplies, but may affect the availability of local agency supplies. This could affect demands on Metropolitan supplies if local agencies abandon impacted supplies in lieu of treatment options or use Metropolitan water to blend with their sources.

In summary, the major regional water quality concerns include the following:

- Salinity
- Perchlorate
- Total organic carbon and bromide (disinfection byproduct precursors)
- Nutrients (as they relate to algal productivity)
- Arsenic
- Uranium
- Chromium-6
- 1,2,3-trichlorpropane
- Constituents of emerging concern (e.g., NDMA, microplastics, and PFAS)

Metropolitan has taken several actions and adopted programs to address these contaminants and to ensure a safe and reliable water supply. These actions, organized by contaminant, are discussed below, along with other water quality programs that Metropolitan has been engaged in to protect its water supplies.

Issues of Potential Concern

Salinity

The State Water Resources Control Board's (SWRCB's) Division of Drinking Water (DDW), formerly the California Department of Public Health, established a secondary drinking water standard for salinity, commonly expressed as total dissolved solids (TDS), with a recommended maximum contaminant level (MCL) of 500 milligrams per liter (mg/L) and upper limit MCL of 1,000 mg/L. Imported water from the Colorado River has high salinity levels, so it must be blended (mixed) with lower-salinity water from the SWP to meet salinity management goals. Higher salinity levels in Colorado River water would increase the proportion of SWP supplies required to meet Metropolitan's Board-adopted imported water salinity objectives. High levels of salinity can impact various water uses such as limiting groundwater and recycled water uses, reducing the lifespan of household appliances, and reducing crop yields. These salinity impacts affect various sectors including residential, agricultural, commercial, industrial, utility, groundwater, and recycled water. Metropolitan adopted an imported water salinity goal because higher salinity could increase costs and reduce operating flexibility. For example,

1. If diminished water quality causes a need for membrane treatment to remove TDS, the process typically results in losses of up to 15 percent of the water processed. These losses would result in both an increased requirement for additional water supplies and environmental constraints related to brine disposal. In addition, the process is costly. However, only a portion of the imported water would need to be processed, so the possible loss in supplies is small.
2. High TDS in water supplies leads to high TDS in wastewater, which lowers the usefulness and increases the cost of recycled water.
3. Water quality degradation of imported water supply could limit the use of local groundwater basins for storage because of standards controlling the quality of water recharged to the basins.

In addition to the link between water supply and water quality, Metropolitan has identified economic benefits from reducing the TDS concentrations of water supplies. Estimates show that a reduction in salinity concentrations of 100 mg/L in both the Colorado River and SWP supplies will yield economic benefits of $95 million per year (1999 dollars) within Metropolitan's service area.[1] This economic benefit provides an additional incentive to reduce salinity concentrations within the region's water supplies.

<u>The Salinity Management Policy</u>

Considering all of these factors, Metropolitan's Board approved a Salinity Management Policy on April 13, 1999. The policy set a goal of achieving salinity concentrations in delivered water of less than 500 mg/L TDS when practical, understanding that hydrologic conditions will make this infeasible at times. It also identified the need for both local and imported water sources to be managed comprehensively to maintain the ability to use recycled water and groundwater. To achieve these targets, lower TDS SWP water supplies are blended with Colorado River supplies. Using this approach, the salinity target could be met an estimated seven out of ten years. In the other three years, hydrologic conditions would result in a reduced volume of SWP supplies and increased salinity. Due to drought conditions, the target goal was exceeded between 2008 and 2011 and again between 2013 and 2018. Metropolitan has alerted its local agencies that high

[1] Metropolitan Water District of Southern California and U.S. Bureau of Reclamation, Salinity Management Study: Final Report (June 1999)

salinity levels are inevitable under these drought conditions despite its best efforts. Metropolitan has also urged its member agencies to structure the operation of their local projects and groundwater supplies so they are prepared to mitigate the effect of higher salinity levels in imported waters.

The adoption of the Salinity Management Policy resulted from the completion of a Salinity Management Study in 1999. Metropolitan worked collaboratively with multiple stakeholders to complete the salinity study which assessed regional salinity problems and developed management strategies. Metropolitan is currently working with the USBR and Southern California Salinity Coalition to update the study. The current study objectives include updating the impact functions of the economic impact model and revising the salinity economic damage assessment for the Colorado River Salinity Control Forum Triennial Review; developing regional salinity indicators to increase awareness and facilitate salinity management in groundwater basins; and assessing Metropolitan's long-term capability of delivering low-salinity water supplies and determining whether new salinity operational goals should be established. In 2020, USBR completed a study updating the economic impact functions of the salinity model. The new model will be used to generate revised estimates for the Lower Colorado River Basin and can be used to update the estimates for Metropolitan's service area. The impacts estimated by the model are based on the change in economic costs from a 500 mg/L baseline condition and the projected elevated salinity concentrations from the Colorado River Simulation System (CRSS) long term planning model which incorporates current and future salinity control projects mainly in the Upper Colorado River Basin.

Within Metropolitan's service area, local water sources account for approximately half of the salt loading, and imported water accounts for the remainder. All of these sources must be managed appropriately to sustain water quality and supply reliability goals. The following sections discuss the salinity issues relevant to each of Metropolitan's major supply sources and other resources.

<u>Colorado River</u>

Colorado River water has the highest level of salinity of all of Metropolitan's sources of supply, averaging around 630 mg/L since 1976. Concern over salinity levels in the Colorado River has existed for many years.

To deal with the concern, the International Boundary and Water Commission approved Minute No. 242, Permanent and Definitive Solution to the International Problem of the Salinity of the Colorado River, in 1973, and the President approved the Colorado River Basin Salinity Control Act in 1974. High TDS in the Colorado River as it entered Mexico and the concerns of the seven basin states regarding the quality of Colorado River water in the United States drove these initial actions. To foster interstate cooperation on this issue, the seven basin states formed the Colorado River Basin Salinity Control Forum (Forum).

The salts in the Colorado River system are indigenous and pervasive, mostly resulting from saline sediments in the basin that were deposited in prehistoric marine environments. They are easily eroded, dissolved, and transported into the river system. The Colorado River Basin Salinity Control Program is designed to prevent a portion of this abundant salt supply from moving into the river system. The program targets the interception and control of non-point sources, such as surface runoff, as well as wastewater and saline hot springs. Examples of salinity control measures include improved irrigation practices, rangeland management, and the operation of a deep well brine injection project.

The Forum proposed, the states adopted, and the USEPA approved water quality standards in 1975, including numeric criteria and a plan for controlling salinity increases. The standards require that the plan ensure that the flow-weighted average annual salinity remain at or below the 1972 levels, while the Basin states continue to develop their 1922 Colorado River Compact-apportioned water supply. The Forum selected three points on the main stream of the lower Colorado River to measure the river's salinity. These points and numeric criteria are: (1) below Hoover Dam, 723 mg/L; (2) below Parker Dam, 747 mg/L; and (3) at Imperial Dam, 879 mg/L.

Per the Forum, concentrations of salts in the Colorado River cause approximately $454 million in quantified damages (2019 dollars) in the lower Basin each year.[2] The salinity control program has proven to be very successful and cost-effective. Salinity control projects remove over a million tons of salts from the Colorado River water annually, resulting in reduced salinity concentrations of over 100 mg/L as a long-term average.

During the high-water flows of 1983-1986, salinity levels in the Colorado River dropped to a historic low of 525 mg/L. However, during the 1987-1992 drought, higher salinity levels of 600 to 650 mg/L returned. TDS in Lake Havasu was measured at 662 mg/L in October 2015 and was 592 mg/L in October 2019. Salinity is projected to continue increasing as water development occurs throughout the Colorado River basin, particularly as the Upper Colorado River Basin States continue to develop their apportioned water reducing dilution in the Colorado River. Also, under drought conditions, Lake Powell has received higher salinity water, and as the system normalizes, salinity is expected to increase in the lower Colorado River as water from Lake Powell is released downstream.

<u>State Water Project</u>

Water supplies from the SWP have significantly lower TDS concentrations than the Colorado River, averaging approximately 250 mg/L in water supplied through the East Branch and 325 mg/L on the West Branch over the long-term, with short term variability as a result of hydrologic conditions.[3] Because of this lower salinity, Metropolitan blends SWP water with high salinity Colorado River water to reduce the salinity concentrations of delivered water. However, both the supply and the TDS concentrations of SWP water can vary significantly in response to hydrologic conditions in the Sacramento-San Joaquin watersheds.

As indicated above, the TDS concentrations of SWP water can vary widely over short periods of time. These variations reflect seasonal and tidal flow patterns, and they pose an additional problem for use of blending as a management tool to lower the higher TDS from the Colorado River supply. For example, during the 1977 drought, the salinity of SWP water reaching Metropolitan increased to 430 mg/L, and supplies became limited. During this same event, salinity at the SWP's Banks pumping plant exceeded 700 mg/L. Under similar circumstances in the future, Metropolitan's 500 mg/L TDS objective could only be achieved by reducing imported water from the Colorado River. Thus, it may be infeasible to maintain both the salinity objective and water supply reliability unless salinity concentrations of source supplies can be reduced.

A federal court ruling on a biological opinion issued in consultation with U.S. Fish and Wildlife Service addressing the effects of the water supply pumping operations on sensitive fish species in the Delta has limited SWP exports at specified times of the year since December 2007. These restrictions have increased reliance on higher salinity Colorado River water, impacting the ability at times to meet Metropolitan's goal of 500 mg/L TDS at its blending plants. Drought conditions leading to lower SWP water supply allocations in recent years also affect Metropolitan's ability to meet its salinity goal. The target goal was exceeded between 2008 and 2011 when water supply

---

[2] Colorado River Basin Salinity Control Program–Briefing Document (March 20, 2019)

[3] The higher salinity in the West Branch deliveries is due to salt loadings from local streams, operational conditions, and evaporation at Pyramid and Castaic Lakes.

allocations were reduced to 35-50 percent. Similarly, the target goal was exceeded between 2013 and 2015 when restricted annual water supply allocations were reduced to 5-35 percent and were briefly reduced to a historical zero percent allocation in January 2014.

The SWP Water Service Contract Article 19 TDS objectives specify a ten-year average of 220 mg/L and a maximum monthly average of 440 mg/L. These objectives have not been met, and Metropolitan is working with DWR and other agencies on programs aimed at reducing salinity in Delta supplies. These programs aim to reduce salinity on the San Joaquin River through modifying agricultural drainage and developing comprehensive basin plans. In addition, operable gates and channel barriers have been placed in strategic locations in the Delta to impede transport of seawater derived salt. For the first time since 1977, in response to California's drought emergency, DWR installed a temporary rock barrier across False River in May 2015 to help limit salt intrusion from the San Francisco Bay into the central Delta. DWR is also leading the development of the Delta Conveyance Project, which involves water delivery upgrades that could reduce SWP salinity levels by diverting a greater percentage of lower salinity Sacramento River flows to the South Delta export pumps.

Recycled Water

Wastewater flows always experience significantly higher salinity concentrations than the potable water supply. Typically, each cycle of urban water use adds 250 to 400 mg/L of TDS to the wastewater. Salinity increases tend to be higher where specific commercial or industrial processes add brines to the discharge stream or where brackish groundwater infiltrates into the sewer system.

Where wastewater flows have high salinity concentrations, the use of recycled water may be limited or require more expensive treatment (e.g., reverse osmosis). Landscape irrigation and industrial reuse become problematic at TDS concentrations over 1,000 mg/L. Some crops such as strawberries and avocados are particularly sensitive to high TDS concentrations, and the use of high-salinity recycled water may reduce crop yields. In addition, water quality objectives in basin plans may lead to restrictions on the use of recycled water on lands overlying those groundwater basins.

These issues are exacerbated during times of drought, when the salinity of imported water supplies may increase salinity in wastewater flows and recycled water. Basin management plans and recycled water customers may restrict the use of recycled water at a time when its use would be most valuable. Therefore, to maintain the cost-effectiveness of recycled water, the salinity level of the region's potable water sources and wastewater flows must be controlled.

In May 2009, the SWRCB adopted a Recycled Water Policy to help streamline the permitting process and to help establish uniform statewide criteria for recycled water projects. The policy was amended in January 2013 and again in December 2018[4] to include baseline monitoring requirements for CECs. The amended policy includes updated annual volumetric reporting requirements for influent, effluent, and recycled water uses. This policy promotes the development of watershed- or basin-wide salt management plans (to be adopted by the respective Regional Boards) to meet water quality objectives and protect beneficial uses, rather than imposing project-by-project restrictions. The Recycled Water Policy identifies several criteria to guide recycled water irrigation or groundwater recharge project proponents in developing a Salt (and Nutrient) Management Plan (SNMP).

[4] https://www.waterboards.ca.gov/board_decisions/adopted_orders/resolutions/2018/121118_7_final_amendment_oal.pdf

Groundwater Basins

Increased TDS in groundwater basins occurs either when basins near the ocean are overdrafted, leading to seawater intrusion, or when agricultural and urban return flows add salts to the basins. Much of the water used for agricultural or urban irrigation infiltrates into the aquifer, so where irrigation water is high in TDS or where the water transports salts from overlying soil, the infiltrating water will increase the salinity of the aquifer. In addition, wastewater discharges in inland regions may lead to salt buildup from fertilizer and dairy waste. In the 1950s and 1960s, high-TDS Colorado River water was used to recharge severely overdrafted aquifers and prevent saltwater intrusion, resulting in significant salt loadings to the region's groundwater basins.

In the past, these high salt concentrations have caused some basins within Metropolitan's service area to be unsuitable for municipal uses if left untreated. The Arlington Basin in Riverside and the Mission Basin in San Diego required demineralization before they could be returned to municipal service. The capacity of the larger groundwater basins makes them better able to dilute the impact of increasing salinity. While most groundwater basins within the region still produce water of acceptable quality, this resource must be managed carefully to minimize further degradation. Even with today's more heightened concern regarding salinity, approximately 600,000 tons of salts per year accumulate within the region, leading to ever-increasing salinity concentrations in many groundwater basins.[5] Drought conditions have further impacted salinity levels in recycled water, reflective of increased salinity levels in source water. Increased recycled water salinity levels make it difficult for dischargers to comply with water quality objectives for groundwater basins.

To protect the quality of groundwater basins, Regional Boards often place restrictions on the salinity concentrations of water used for basin recharge or for irrigation of lands overlying the aquifers. Those situations may restrict water reuse and aquifer recharge, or they may require expensive mitigation measures. SNMPs offer an opportunity for stakeholders to work with Regional Boards to address salt and nutrient issues regionally. The SNMP development process is locally driven and focuses on addressing all sources of salts and nutrients, instead of only regulating individual recycled water projects which may not address all sources impacting groundwater. The SNMP objectives include: optimizing recycled water use, protecting groundwater supply and beneficial uses, protecting agricultural beneficial uses, and protecting human health. SNMPs were to be completed by May 2014 with a possible two-year extension. After completion, SNMPs may be adopted in a Basin Plan Amendment.

Several SNMPs were completed by the completion deadline, while other plans were granted an extension for completion in 2016. The Santa Ana Region Basin Plan updated its TDS and Nitrogen Management Plan with a subsequent SNMP amendment in 2014. This SNMP highlights efforts to implement extensive groundwater recharge projects using recycled water in the Chino Basin and expansion of the GWRS in Orange County. The Central Basin and West Coast Basin SNMP was approved as an amendment to the Los Angeles Region Basin Plan in February 2015. This SNMP highlights existing and planned implementation measures to ensure future compliance with water quality objectives including increased recharge at seawater intrusion barriers, increased groundwater pump and treat by the Goldsworthy and Brewer Desalters, and increased recycled water use for irrigation. Multiple SNMPs have been completed in the San Diego Region, and basin plan amendments are being considered. SNMPs have also been approved for the Main San Gabriel Basin and the Raymond Basin.

[5] Metropolitan Water District of Southern California and U.S. Bureau of Reclamation, Salinity Management Study: Final Report (June 1999)

Perchlorate

Perchlorate compounds are used as a main component in solid rocket propellant and are also found in some types of munitions and fireworks. Perchlorate compounds quickly dissolve and become highly mobile in groundwater. Unlike many other groundwater contaminants, perchlorate neither readily interacts with the soil matrix nor degrades in the environment. Conventional drinking water treatment (as utilized at Metropolitan's water treatment plants) is not effective for perchlorate removal.

The primary human health concern related to perchlorate is its effect on the thyroid. Perchlorate can interfere with the thyroid's ability to produce hormones required for normal growth and development. Pregnant women who are iodine deficient and their fetuses, infants and small children with low dietary iodide intake, and individuals with hypothyroidism may be more sensitive to the effects of perchlorate.

DDW established a primary drinking water standard for perchlorate in 2007 with an MCL of 6 micrograms per liter (µg/L), and a detection limit for purposes of reporting (DLR) of 4 µg/L. In February 2015, the California Office of Environmental Health Hazard Assessment (OEHHA) lowered the public health goal (PHG)[6] for perchlorate from 6 µg/L to 1 µg/L. In response to the new PHG,[7] DDW reviewed the perchlorate MCL, but there was a lack of occurrence data below the DLR of 4 µg/L. In July 2020, due to improved analytical methods, and in order to evaluate a lower MCL, DDW proposed lowering the DLR for perchlorate initially to 2 µg/L, and subsequently to the PHG of 1 µg/L in a second phase effective January 1, 2024. On October 6, 2020, the SWRCB approved the proposal. There is currently no federal drinking water standard for perchlorate. On June 18, 2020, the USEPA withdrew its 2011 determination to regulate perchlorate under the SDWA and decided not to develop a federal MCL for perchlorate at the present time. Whether the USEPA should issue a national drinking water standard for perchlorate is the subject of ongoing litigation by the Natural Resources Defense Council. The case is currently on hold while EPA is reviewing its prior decision not to set a federal MCL for perchlorate for compliance with the President's Executive Order on "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis."

Perchlorate was first detected in Colorado River water in June 1997 and was traced back to Las Vegas Wash. The source of contamination was found to be emanating from two chemical manufacturing facilities in Henderson, Nevada: (1) the former Tronox, Inc. site, and (2) a facility owned by American Pacific Corporation (AMPAC).

Following the detection of perchlorate in the Colorado River, Metropolitan, along with USEPA and agencies in Nevada including the Nevada Division of Environmental Protection (NDEP), organized the forces necessary to successfully treat and decrease the sources of perchlorate loading. Under NDEP oversight, remediation efforts began in 1998, and treatment operations became fully operational in 2004. These efforts have reduced perchlorate loading into Las Vegas Wash from over 1,000 lbs/day (prior to treatment) to 50-90 lbs/day since early 2007. This has resulted in over 90 percent reduction of the perchlorate loading entering the Colorado River system. As of December 2020, remediation activities in Southern Nevada have resulted in the removal of more than 6,800 tons of perchlorate from the environment. In January 2009, Tronox filed for Chapter 11 bankruptcy protection citing significant environmental liabilities taken from the previous site owner. A settlement was reached in February 2011 which resulted in the

[6] A PHG is a concentration of a contaminant in drinking water that does not pose a significant risk to health.
[7] MCLs are required to be established at a level as close to a chemical's PHG as is technologically and economically feasible, placing primary emphasis on the protection of public health.

formation of the Nevada Environmental Response Trust (NERT). NERT initially received $81 million for cleanup efforts while pursuing additional funding sources.

In April 2014, Tronox reached a $5.15 billion settlement with its predecessors which awarded approximately $1.1 billion, directed to NERT, to clean up perchlorate and certain other contaminants at the former Tronox site in Henderson. The settlement, which represents one of the largest environmental recoveries in history, went into effect in January 2015 and helps to ensure adequate funds are available for site cleanup and protection of the downstream Colorado River. In December 2020, NERT's assets totaled approximately $1.28 billion. NERT is currently investigating remedial options for long-term soil and groundwater cleanup, as well as conducting a regional investigation of downgradient perchlorate-contaminated areas to further reduce loading into Las Vegas Wash. This would help ensure compliance with a potential reduction of California's perchlorate MCL of 6 µg/L, in light of the 1 µg/L PHG.

As a result of the aggressive clean-up efforts, perchlorate levels in Colorado River water at Lake Havasu have decreased significantly in recent years from a peak of 9 µg/L in May 1998. Levels have remained less than 6 µg/L since October 2002 and have been typically less than 2 µg/L since June 2006. Metropolitan routinely monitors perchlorate at over 30 locations within its system, and levels currently remain below 2 µg/L. Metropolitan has not detected perchlorate in the SWP since monitoring began in 1997.

Perchlorate has also been found in groundwater basins within Metropolitan's service area, largely from local sources. The vast majority of locations where perchlorate has been detected in the groundwater are associated with the manufacturing or testing of solid rocket fuels for the Department of Defense and the National Aeronautics and Space Administration (NASA), or with the manufacture, storage, handling, or disposal of perchlorate (such as Aerojet in Azusa in the Main San Gabriel Basin and the Jet Propulsion Laboratory/NASA in the Raymond Basin). Past agricultural practices using fertilizers laden with naturally occurring perchlorate have also been implicated in some areas. As of October 2020, per SWRCB's water quality database, reported monitoring results from 2011 to present indicate that 358 wells in the counties of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura have detected perchlorate in their service areas at levels greater than 4 µg/L, while 219 wells have detected levels greater than 6 µg/L.[8] Water systems may have installed treatment or removed wells from service due to perchlorate concentrations.

Metropolitan has investigated technologies to mitigate perchlorate contamination. Perchlorate cannot be removed using conventional water treatment. Nanofiltration and reverse osmosis do work effectively, but at a very high cost. Endeavour, LLC (which was formed in 2015 to continue operation of AMPAC's groundwater treatment system) and NERT utilize a biological fluidized bed reactor (FBR) process train for the cleanup of their Henderson sites. A number of sites in Southern California have successfully installed ion exchange systems to treat perchlorate impacted groundwater. In November 2009, a study of biological treatment for perchlorate removal in the City of Pasadena's groundwater was completed with funding provided through a Congressional mandate from USEPA to Metropolitan. The City of Pasadena decided to continue using ion exchange treatment for perchlorate removal and expanded treatment to two well sites.

Treatment options are available to recover groundwater supplies contaminated with perchlorate. However, it is very difficult to predict whether treatment will be pursued to recover all lost production because local agencies will make decisions based largely on cost

considerations, ability to identify potentially responsible parties for cleanup, and the availability of alternative supplies.

Total Organic Carbon and Bromide

Disinfection byproducts (DBPs) form when source water containing high levels of total organic carbon (TOC) and bromide is treated with disinfectants such as chlorine or ozone. Studies have shown a link between certain cancers and DBP exposure. In addition, some studies have shown an association between reproductive and developmental effects and chlorinated water. While many DBPs have been identified and some are regulated under the Safe Drinking Water Act, there are others that are not yet known. Even for those that are known, the potential adverse health effects may not be fully characterized.

Water agencies began complying with new regulations to protect against the risk of DBP exposure in January 2002. This rule, known as the Stage 1 Disinfectants and Disinfection Byproducts (D/DBP) Rule, required water systems to comply with new MCLs and a treatment technique to improve control of DBPs. USEPA then promulgated the Stage 2 D/DBP Rule in January 2006 requiring systems to comply at terminus locations in the distribution system to be more representative of maximum residence time and to protect the public. Metropolitan has been in compliance with the Stage 2 D/DBP Rule since it became effective.

Existing levels of TOC and bromide in Delta water supplies present challenges for water utilities to maintain safe drinking water supplies and comply with regulations. Levels of these constituents in SWP water increase several-fold due to agricultural drainage and seawater intrusion as water moves through the Delta.

SWP water has also experienced lower alkalinity concentrations during years with increased snowmelt, particularly in 2017 and 2019. Low alkalinity requires higher TOC removal by treatment plants and potentially contributes to increased water corrosivity. As a corrosion control strategy, Metropolitan may blend low alkalinity SWP water with Colorado River Water, adjust effluent pH, and increase plant effluent alkalinity.

Source water quality improvements must be combined with cost-effective water treatment technologies to ensure safe drinking water at a reasonable cost. Metropolitan has five treatment plants: two that receive SWP water exclusively, and three that receive a blend of SWP and Colorado River water. In 2003 and 2005, Metropolitan completed upgrades to its SWP-exclusive water treatment plants, Mills and Jensen, respectively, to utilize ozone as its primary disinfectant. This ozonation process minimizes the production of certain regulated disinfection byproducts that would otherwise form in the chlorine treatment of SWP water. The non-ozone plants utilizing blended water met federal guidelines for these byproducts through managing the blend of SWP and Colorado River water. To maintain the byproducts at a level consistent with federal law, Metropolitan limited the percentage of water from the SWP for plants utilizing chlorine as the primary disinfectant. In 2010, 2015, and 2017, Metropolitan completed ozone upgrades at Skinner, Diemer, and Weymouth water treatment plants, respectively. The estimated ozone retrofit cost for all five treatment plants is over $1.1 billion.

Nutrients

Elevated levels of nutrients (phosphorus and nitrogen compounds) can stimulate nuisance algal and aquatic weed growth that affects water system operations and consumer acceptability, including the production of noxious taste and odor compounds and algal toxins. In addition to taste and odor and toxin concerns, increases in algal and aquatic weed biomass can impede flow in conveyances, shorten filter run times, increase solids production at drinking water treatment plants, and add to organic carbon loading. Further, nutrients can provide an increasing food source that may lead to the proliferation of quagga and zebra mussels, and other invasive biological species. Studies have shown phosphorus to be the limiting nutrient in both SWP and Colorado River supplies. Therefore, any increase in phosphorus loading has the potential to stimulate algal growth, leading to the concerns identified above.

SWP supplies have significantly higher nutrient levels than Colorado River supplies. Wastewater discharges, agricultural drainage, and nutrient-rich soils in the Delta are primary sources of nutrient loading to the SWP. Metropolitan and other drinking water agencies receiving Delta water have been engaged in efforts to minimize the effects of nutrient loading from Delta wastewater plants. The Sacramento Regional County Sanitation District (SRCSD), the primary discharger to the Sacramento River, is in the process of constructing wastewater treatment plant upgrades to comply with its 2010 discharge permit requirements for ammonia and nitrate removal. Excessive levels of ammonia are suspected to be altering the Delta's food web which, in turn, has implications for SWP supply reliability. SRCSD expects to complete its EchoWater Project by mid-2022, in compliance with the 2023 deadline, and has stated that the project will serve multiple benefits including improving water quality in the Sacramento River, protecting the fragile Delta ecosystem, and expanding recycled water use opportunities. The improvements include a biological nutrient removal process for ammonia and nitrate removal. The project also includes tertiary treatment processes for filtration and enhanced disinfection. In 2014, the City of Stockton Wastewater Treatment Plant, a discharger to the San Joaquin River, was issued a draft permit with a more stringent nitrate discharge limit consistent with the final discharge limits issued in SRCSD's permit. Due to the lower limit, the City of Stockton began to make plans to implement similar plant upgrades as SRCSD to comply with discharge permit requirements. Construction is planned to be completed in March 2023.

Metropolitan reservoirs receiving SWP water have experienced several taste and odor episodes in recent years. For example, between 2015 and June 2020, Metropolitan reservoirs experienced 13 taste and odor events requiring treatment. A taste and odor event can cause a reservoir to be bypassed and potentially have a short-term effect on the availability of that supply. Metropolitan has a comprehensive program to monitor and manage algae in its source water reservoirs. This program was developed to provide an early warning of algae related problems and taste and odor events to best manage water quality in the system.

The issue of cyanotoxins has become a growing concern as a result of increasing occurrences both nationally and internationally. For example, in August 2014, an algae bloom producing Microcystin in Lake Erie significantly affected the water supply for Toledo, Ohio, prompting the city to issue urgent notices to residents to not drink or boil the drinking water. This event stimulated state and federal legislation to develop health advisories and strategic plans for algal toxins. In June 2015, USEPA issued health advisories for two cyanobacterial toxins: Microcystins and Cylindrospermopsin. The health advisories serve as recommended precautionary levels and are not enforceable federal water quality standards. Cyanotoxins are included on the current Contaminant Candidate List (CCL4), which identifies contaminants considered for regulation under the Safe Drinking Water Act. USEPA has developed improved analytical methods for cyanotoxins to support nationwide monitoring for Microcystins, Anatoxin-a, and Cylindrospermopsin through the Unregulated Contaminant Monitoring Rule 4 program, which was published in 2016 and required monitoring to be conducted between 2018 and 2020. Metropolitan is complying with Unregulated Contaminant Monitoring Rule monitoring and reporting requirements. Although phosphorus levels are much lower in the Colorado River than in the SWP, this nutrient is still of concern. Despite relatively low concentrations (Colorado River has been considered an oligotrophic, or low-productivity, system), any additions of phosphorus to Colorado River water can result in increased algal growth. In addition, low nutrient Colorado River water is relied upon by Metropolitan to blend down the high nutrient SWP water in Metropolitan's blend reservoirs. With population growth expected to continue in the Las Vegas area in the future, ensuring high levels of treatment at wastewater treatment plants to maintain existing phosphorus levels will be critical in minimizing the operational, financial, and public health impacts associated with excessive algal growth and protecting downstream drinking water uses. Metropolitan and other affected drinking water agencies collaborate with wastewater dischargers in the Las Vegas area to protect the phosphorus-limited Colorado River. Since 2001, wastewater dischargers have undertaken considerable efforts to improve treated effluent water quality by removing phosphorus on a year-round basis. In 2005, dischargers also began optimizing their treatment processes to remove greater amounts of phosphorus, maintaining levels well below current permit requirements.

Although current nutrient loading is of concern for Metropolitan and is anticipated to have cost implications, with its comprehensive monitoring program and response actions to manage algal related issues, there should be no impact on availability of water supplies. Metropolitan's source water protection program will continue to focus on preventing future increases in nutrient loading as a result of urban and agricultural sources.

Arsenic

Arsenic is a naturally occurring element found in rocks, soil, water, and air. It is used in wood preservatives, alloying agents, certain agricultural applications, semi-conductors, paints, dyes, and soaps. Arsenic can get into water from the natural erosion of rocks, dissolution of ores and minerals, runoff from agricultural fields, and discharges from industrial processes. Long-term exposure to elevated levels of arsenic in drinking water has been linked to certain cancers, skin pigmentation changes, and hyperkeratosis (skin thickening).

In April 2004, OEHHA set a PHG for arsenic of 0.004 μg/L, based on lung and urinary bladder cancer risk. The MCL for arsenic in domestic water supplies was lowered to 10 μg/L, with an effective date of January 2006 in the federal regulations, and an effective date of November 2008 in the California regulations. Monitoring results submitted to California Department of Public Health (now DDW) since 2010 showed that arsenic is ubiquitous in drinking water sources, reflecting its natural occurrence. They also showed that many sources have arsenic detections above the 10 μg/L MCL. Southern California drinking water sources, by county, that contain concentrations of arsenic over 10 μg/L include San Bernardino (113 sources), Los Angeles (82 sources), Riverside (52 sources), San Diego (5 sources), Orange (10 sources), and Ventura (3 sources).[9]

The arsenic drinking water standard impacts both groundwater and surface water supplies. Historically, Metropolitan's water supplies have had low levels of this contaminant and did not require treatment changes or capital investment to comply with the standard. However, some of Metropolitan's water supplies from groundwater storage programs are at levels near the MCL. These groundwater storage projects are called upon to supplement flow only during low SWP allocation years. Under drought conditions, Metropolitan has further relied on groundwater storage programs and continues to participate in the California Aqueduct Pump-in Facilitation Group to ensure that water quality in the SWP is not adversely affected when considering water supply decisions. Metropolitan has had to restrict flow from one program to limit arsenic increases in the SWP. Implementation of an arsenic treatment facility, which is operated by a groundwater

[9] DDW data reported from the SWRCB Groundwater Ambient Monitoring Assessment Program's web site: https://gamagroundwater.waterboards.ca.gov/. Numbers reported may change as the website is frequently updated. Also, the website includes additional source data reported by other entities.

banking partner, has increased groundwater supply costs. Moreover, Metropolitan has invested in solids handling facilities at its treatment plants and implemented operational changes to manage arsenic in the treatment process residual solids.

The DLR for arsenic is 2 μg/L. Between 2010 and June 2020, arsenic levels in Metropolitan's water treatment plant effluents ranged from non-detect (< 2 μg/L) to 3.3 μg/L. For Metropolitan's source waters, levels in Colorado River water have ranged from 2.2 to 2.8 μg/L, while levels in SWP water have ranged from non-detect to 4.8 μg/L. Increasing coagulant doses at water treatment plants can reduce arsenic levels for delivered water.

Some member agencies may face greater problems with arsenic compliance due to naturally occurring arsenic in groundwater. Per the Water Replenishment District's 2018-2019 Regional Groundwater Monitoring Report, arsenic concentrations greater than the 10 μg/L MCL were detected in 9 of 220 Central Basin production wells.[10] Water supplies imported by the Los Angeles Department of Water and Power may also contain arsenic above the MCL. The cost of arsenic removal from these supplies could vary significantly.

Uranium

The U.S. Department of Energy (DOE) has completed about 66 percent of a project to move a 16-million-ton pile of uranium mill tailings near Moab, Utah, which lies approximately 750 feet from the Colorado River. Due to the proximity of the pile to the Colorado River, there is a potential for the tailings to enter the river as a result of a catastrophic flood event or other natural disaster. In addition, contaminated groundwater from the site is slowly seeping into the river. The DOE is responsible for remediating the site, which includes removal and offsite disposal of the tailings and onsite groundwater remediation.

Previous investigations have shown uranium concentrations contained within the pile at levels significantly above the California MCL of 20 picocuries per liter (pCi/L). Metropolitan has been monitoring for uranium in the CRA and at its treatment plants since 1986. Monitoring at Lake Powell began in 1998. Uranium levels measured at Metropolitan's intake have ranged from 1 to 6 pCi/L, well below the California MCL. Conventional drinking water treatment, as employed at Metropolitan's water treatment plants, can remove low levels of uranium; however, these processes would not be protective if a catastrophic event washed large volumes of tailings into the Colorado River. Public perception of drinking water safety is also of particular concern as to uranium.

Remedial actions at the site since 1999 have focused on removing contaminated water from the pile and groundwater. To date, over 5,300 pounds of uranium in contaminated groundwater have been removed. In July 2005, DOE issued its Final Environmental Impact Statement with the preferred alternative of permanent offsite disposal by rail to a disposal cell at Crescent Junction, Utah, located approximately 30 miles northwest of the Moab site.

Rail shipment and disposal of the uranium mill tailings pile from the Moab site began in April 2009 using American Recovery and Reinvestment Act 2009 funding which helped to accelerate initial cleanup efforts. Through September 2020, DOE has shipped over 10.9 million tons of mill tailings to the Crescent Junction disposal cell. DOE estimates completing movement of the tailings pile by 2034, depending on annual appropriations. Metropolitan continues to track progress of the remediation efforts and work with Congressional representatives to support increased annual appropriations and expedite cleanup.

[10] *Regional Groundwater Monitoring Report Water Year 2018-2019, Los Angeles County, California*, prepared by Water Replenishment District, March 2020.

Another uranium-related issue began receiving attention in 2008 due to a renewed worldwide interest in nuclear energy and a resulting increase in uranium mining claims filed throughout the western United States. Of particular interest were thousands of mining claims filed near Grand Canyon National Park and the Colorado River. Metropolitan sent letters to the Secretary of the Interior to highlight source water protection and consumer confidence concerns related to uranium exploration and mining activities near the Colorado River, and advocate for close federal oversight over these activities. In 2009, Secretary of the Interior Ken Salazar announced a two-year hold on new mining claims on 1 million acres adjacent to the Grand Canyon to allow necessary scientific studies and environmental analyses to be conducted. In January 2012, Secretary Salazar formally signed a 20-year moratorium on new uranium and other hard rock mining claims. The moratorium has been challenged by a number of industry groups and was most recently upheld by a U.S. District Court in September 2014. Meanwhile, local conservation groups continue to defend the moratorium and are seeking additional protection of lands with mines that have been inactive for long periods of time but may resume operations. Although of no direct impact to Metropolitan due to its upstream location and resulting dilution, in August 2015, an accidental release of wastewater from an abandoned mine in southwest Colorado demonstrated the potential threat that mining activities can have on public health and the environment. In 2020, the DOE released a strategy to revive and expand nuclear fuel production which would be of interest to Metropolitan if projects are in proximity to the Colorado River.

Chromium-6

Chromium is a naturally occurring element found in rocks, soil, plants, and animals. Chromium-3 is typically the form found in soils and is an essential nutrient that helps the body use sugar, protein, and fat. Chromium-6 is used in electroplating, stainless steel production, leather tanning, textile manufacturing, dyes and pigments, wood preservation, and as an anti-corrosion agent. Chromium occurs naturally in deep aquifers and can also enter drinking water through discharges of dye and paint pigments, wood preservatives, chrome plating liquid wastes, and leaching from hazardous waste sites. In drinking water, chromium-6 is very stable and soluble, whereas chromium-3 is not very soluble. Chromium-6 is the more toxic species and is known to cause lung cancer in humans when inhaled, but the health effects in humans from ingestion are still in question. There is evidence that when chromium-6 enters the stomach, gastric acids may reduce it to chromium-3. However, recent studies conducted by the National Toxicology Program have shown that chromium-6 can cause cancer in animals when administered orally.

Effective July 1, 2014, California's Office of Administrative Law approved a primary drinking water standard of 10 μg/L for chromium-6. In May 2017, the Superior Court of Sacramento County issued a judgment invalidating California's MCL of 10 μg/L for chromium-6 on the basis that CDPH (now DDW), had not properly considered the economic feasibility of complying with the MCL. DDW therefore rescinded the chromium-6 MCL. However, chromium-6 remains regulated as part of total chromium. California's MCL for total chromium is 50 μg/L. In February 2020, DDW released a white paper discussion on an updated economic feasibility analysis of chromium-6 treatment for the consideration of a new chromium-6 MCL. USEPA regulates chromium-6 as part of the total chromium drinking water standard of 100 μg/L and is currently evaluating whether a new federal drinking water standard for chromium-6 is warranted based on new health effects information.

Metropolitan utilizes an analytical method with a minimum reporting level of 0.03 μg/L, which is less than the State DLR of 1 μg/L. In the past 5 years, the results from all of Metropolitan's source and treated waters are less than the State DLR. The following summarizes chromium-6 levels found in Metropolitan's system:

In the past 5 years, results of source and treated water monitoring for chromium-6 indicate the following:

- Levels in Colorado River water are mostly not detected (<0.03 μg/L), but when detected, levels range from 0.03 to 0.085 μg/L. SWP levels range from 0.03 to 1.0 μg/L. Treated water levels range from 0.03 to 0.8 μg/L.
- There is a slight increase in chromium-6 in the treated water from the oxidation (chlorination and ozonation) of natural background chromium (total) to chromium-6.
- Colorado River monitoring results upstream and downstream of the site of a Pacific Gas and Electric (PG&E) gas compressor station located along the Colorado River near Topock, Arizona (discussed below) have ranged from not detected (<0.03 μg/L) to 0.06 μg/L.
- Chromium-6 in Metropolitan's groundwater pump-in storage programs in the Central Valley has ranged from not detected (< 1 μg/L) to 8.9 μg/L in 2014, with the average for the different programs ranging from < 1 μg/L to 3 μg/L.

PG&E used chromium-6 as an anti-corrosion agent in its cooling towers at the Topock site from 1951 to 1985. Wastewater from the cooling towers was discharged from 1951 to 1968 into a dry wash next to the station. Monitoring wells show the plume concentration has peaked as high as 16,000 μg/L in groundwater. Since 2004, PG&E has operated an interim groundwater extraction and treatment system that is protecting the Colorado River. This interim treatment system will be taken offline in September 2021 and replaced by the long-term groundwater remedy system. Quarterly monitoring of the river has shown levels of chromium-6 less than 1 μg/L, which are considered background levels. The California Department of Toxic Substances Control (DTSC) and the U. S. Department of the Interior are the lead state and federal agencies overseeing the cleanup efforts. Metropolitan participates through various stakeholder workgroups and partnerships that include state and federal regulators, Indian tribes, and other stakeholders (e.g., Colorado River Board) involved in the corrective action process. In January 2011, a final treatment remedy was selected, and an Environmental Impact Report was certified. In November 2015, PG&E completed the final remedy design based on the selected remedy which involves the installation of an in-situ bioremediation treatment system. In April 2015, DTSC required the preparation of a Subsequent Environmental Impact Report (EIR) to address new design details. The Subsequent EIR was certified in April 2018. Construction of Phase 1, consisting of an In-situ reduction zone, began in October 2018 and is expected to be completed in 2021. Phase 2, consisting of a freshwater injection system, is anticipated to begin construction in 2023 and last about one year. Operation of the treatment system will run for an estimated 30 years.

The federal- and state-approved technologies for removing total chromium from drinking water include coagulation/filtration, ion exchange, reverse osmosis, and lime softening. For several years, the cities of Glendale, Burbank, and Los Angeles have been voluntarily limiting chromium-6 levels in their drinking water to 5 μg/L, even after the MCL was rescinded in 2017.

1,2,3-Trichloropropane (1,2,3-TCP)

1,2,3-TCP is a chlorinated hydrocarbon with high chemical stability. It is a manmade chemical found at industrial or hazardous waste sites. It has been used as a cleaning and degreasing solvent and also is associated with pesticide products.

At its July 18, 2017 public meeting, the SWRCB adopted an MCL of 5 parts per trillion (ppt) for 1,2,3-TCP, and related requirements, including establishing a DLR, identifying the best available technology for treatment, and setting public notification and consumer confidence report language. The regulations also included a method for public water systems to substitute existing water quality data for initial monitoring requirements under certain circumstances. Under the new regulation, drinking water agencies are required to perform quarterly monitoring of 1,2,3-TCP. There have been no detections of this chemical in Metropolitan's system. However, 1,2,3-TCP has been detected above the new MCL in groundwater wells of three of Metropolitan's groundwater storage program partners through monitoring performed by these agencies. Levels detected in groundwater wells of the Arvin-Edison Water Storage District are the highest and impact the ability of Metropolitan to put water and take return water under that program. Metropolitan has temporarily suspended operation of this program until the water quality concerns can be further evaluated and managed. The levels of 1,2,3-TCP detected in Metropolitan's other groundwater storage programs are much lower and impact fewer groundwater wells. Metropolitan is evaluating the effects of TCP on the return capability of those programs. Southern California counties that have detected concentrations of 1,2,3-TCP in drinking water sources at or over 5 ppt since 2010 include San Bernardino (48 sources), Los Angeles (63 sources), Riverside (24 sources), San Diego (10 sources), and Ventura (3 sources).[11]

Constituents of Emerging Concern

N-Nitrosodimethylamine

N-Nitrosodimethylamine (NDMA) is part of a family of organic chemicals called nitrosamines. NDMA is a chloramine disinfection by-product, and it is the most abundantly detected nitrosamine in drinking water systems. Metropolitan utilizes chloramines as a secondary disinfectant at its treatment plants. Wastewater treatment plant discharges can contribute organic matter into source waters, which react with chloramines to form NDMA at drinking water treatment plants. Certain coagulation aid polymers used in water treatment, e.g., polydiallyldimethylammonium chloride (polyDADMAC), can also contribute to NDMA formation. Some NDMA control measures are being used to avoid adverse impacts on Southern California drinking water supplies. Metropolitan is involved in several projects to understand the impact of different treatment processes on NDMA and its precursors at drinking water treatment plants and in distribution systems. Certain pre-oxidation processes, such as chlorine and ozone, have been shown to destroy NDMA precursors. Additional studies are being conducted to better understand how polyDADMAC contributes to NDMA formation and to identify measures to reduce polymer-derived NDMA formation.

USEPA considers NDMA to be a probable human carcinogen. USEPA placed NDMA on the Contaminant Candidate List 4 (CCL4). Although there is no federal regulation for nitrosamines in drinking water, DDW set a notification level of 0.01 µg/L each for NDMA and two other nitrosamines. Occurrences of NDMA in treated water supplies at concentrations greater than 0.01 µg/L are recommended to be included in a utility's annual Consumer Confidence Report. In December 2006, OEHHA set a PHG for NDMA of 0.003 µg/L. Since 1999, Metropolitan has conducted voluntary monitoring of the five treatment plant effluents and representative distribution system locations semi-annually. NDMA is the only detected nitrosamine in Metropolitan's treated water systems, and it is in the range of non-detect (<0.002 µg/L) to 0.006 µg/L. NDMA or a broader class of nitrosamines may likely be the next class of disinfection by-products to be regulated by USEPA.

[11] DDW data reported from SWRCB Groundwater Ambient Monitoring Assessment Program's web site: https://gamagroundwater.waterboards.ca.gov/. Numbers reported may change as the website is frequently updated. Also, the website includes additional source data reported by other entities.

Pharmaceuticals and Personal Care Products

Pharmaceuticals and personal care products (PPCPs) are a growing concern to the water industry. Numerous studies have reported the occurrence of these emerging contaminants in treated wastewater, surface water, and sometimes, in finished drinking water in the United States and around the world. The use of ozone in treatment processes may have a beneficial effect on PPCP removal in drinking water. The sources of PPCPs in the aquatic environment include (but may not be limited to) treated wastewater and industrial discharge, agricultural run-off, and leaching of municipal landfills. Currently, there is no evidence of human health risks from long-term exposure to the low concentrations (low ng/L; parts per trillion) of PPCPs found in some drinking water. Furthermore, there are no regulatory requirements for PPCPs in drinking water. USEPA included 14 PPCPs on the CCL3 and 10 PPCPs on the CCL4, nine of which are carried over from the CCL3; however, currently there are no standardized analytical methods for these compounds. USEPA's strategy for addressing PPCPs involves strengthening analytical methods, conducting source studies, improving public understanding of PPCPs in water, building partnerships and promoting stewardship opportunities, and taking regulatory action when appropriate.

In 2007, Metropolitan implemented a short-term monitoring program to determine the occurrence of PPCPs and other organic wastewater contaminants in Metropolitan's treatment plant effluents and selected source water locations within the Colorado River and SWP watersheds. Currently, PPCP monitoring is conducted on an annual basis for Metropolitan's source waters and treatment plants. Some PPCPs have been detected at very low ng/L levels, which is consistent with reports from other utilities. However, analytical methods are still being refined, and more work is required to fully understand occurrence issues. Metropolitan has been actively involved in studies related to PPCPs, including analytical methods improvements, and characterization of drinking water sources in California.

Microplastics

In 2018, Senate Bill No. 1422 added Section 116376 to the Health and Safety Code, which required the SWRCB to adopt a definition of microplastics in drinking water on or before July 1, 2020. Section 116376 also requires the SWRCB on or before July 1, 2021, to: (1) adopt a standard methodology to be used in the testing of drinking water for microplastics; (2) adopt requirements for four years of testing and reporting of microplastics in drinking water, including public disclosure of those results; (3) if appropriate, consider issuing a notification level or other guidance to help consumer interpretations of the results of the testing required; and (4) accredit qualified laboratories in California to analyze microplastics. No other states have defined microplastics. Knowledge in the microplastics field has been primarily provided by the European Union. On June 16, 2020, the SWRCB adopted a definition, acknowledging the definition is a work in progress, and stated the SWRCB will re-visit the microplastic definition as knowledge in the field progresses. The definition reads: *'Microplastics in Drinking Water' are defined as solid polymeric materials to which chemical additives or other substances may have been added, which are particles which have at least three dimensions that are greater than 1nm and less than 5,000 micrometers (µm). Polymers that are derived in nature that have not been chemically modified (other than by hydrolysis) are excluded.* Metropolitan is participating in a study with the Southern California Coastal Water Research Project to develop analytical methods for microplastics.

Per- and Polyfluoroalkyl Substances (PFAS)

Drinking water containing perfluorooctanoic acid (PFOA), perfluorooctanesulfonic acid (PFOS) – and the larger family of per- and polyfluoroalkyl substances (PFAS) – has become an increasing concern due to the persistence of these chemicals in the environment and their tendency to accumulate in groundwater.

In August 2019, the SWRCB's Division of Drinking Water (DDW) updated its guidelines for local water agencies to follow in detecting and reporting the presence of these chemicals in drinking water. The guidelines lower the notification levels from 14 parts per trillion (ppt) to 5.1 ppt for PFOA and from 13 ppt to 6.5 ppt for PFOS. These levels are based on updated health recommendations from the Office of Environmental Health Hazard Assessment (OEHHA), which is part of the California Environmental Protection Agency. Notification levels are non-regulatory, precautionary health-based measures for concentrations of chemicals in drinking water that warrant notification and further monitoring and assessment. If a chemical concentration is greater than its notification level in drinking water that is provided to consumers, DDW recommends that the utility inform its customers and consumers about the presence of the chemical and about health concerns associated with exposure to it. The SWRCB also set new response levels (RLs) of 10 parts per trillion (ppt) for PFOA and 40 ppt for PFOS based on a running four quarter average. Previously, the RL was 70 ppt for the total concentration of the two contaminants combined. A response level is set higher than a notification level and represents a chemical concentration level at which DDW recommends a water system consider taking a water source out of service or providing treatment if that option is available to them. In March 2021, DDW issued an NL of 0.5 parts per billion (ppb) and an RL of 5 ppb for perfluorobutane sulfonic acid (PFBS), another PFAS chemical. The NL for PFBS is 100 times higher than the NLs for PFOA and PFOS. Metropolitan sources have not been affected by PFBS, but Metropolitan has not yet evaluated potential PFBS impacts on its member agencies' sources. DDW has also asked OEHHA to recommend NLs for six other PFAS compounds consistently detected in California drinking water sources: perfluorohexane sulfonic acid (PFHxS), perfluorohexanoic acid (PFHxA), perfluoroheptanoic acid (PFHpA), perfluorononanoic acid (PFNA), perfluorodecanoic acid (PFDA), and 4,8-dioxia-3H-perflourononanoic acid (ADONA). Legislation which took effect on January 1, 2020 (California Assembly Bill 756), requires that water systems that receive a monitoring order from the SWRCB and detect levels of PFAS that exceed their respective RLs must either take the drinking water source out of use or provide specified public notification if they continue to supply water above the RL.

In addition to the updated notification levels, DDW has requested that OEHHA develop PHGs for both PFOA and PFOS, the next step in the process of establishing MCLs in drinking water. As of the writing of this UWMP, draft PHGs have not been released. Other chemicals in the broader group of PFAS may be considered later, either individually or grouped, as data permits. On March 19, 2021, OEHHA announced its intent to list PFOA as a carcinogen under the Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65). On March 26, 2021, OEHHA announced its review of the carcinogenic hazard of PFOS for possible listing under Proposition 65. That same day, OEHHA also announced its assessment of the reproductive toxicity of PFDA, PFHxS, PFNA, and perfluoroundecanoic acid (PFUnDA) for possible listing under Proposition 65. Comments regarding whether PFOA meets the criteria to be listed as a carcinogen under Proposition 65 were due by May 3, 2021. The public had until May 10, 2021, to submit information relevant to the assessment of the carcinogenicity of PFOS and the reproductive toxicity of PFDA, PFHxS, PFNA, and PFUnDA. In November 2017, OEHHA listed PFOA and PFOS as chemicals known to cause reproductive toxicity under Proposition 65. Proposition 65 requires businesses to provide warnings to Californians about significant exposures to chemicals that cause cancer, birth defects or other reproductive harm. Proposition 65 also prohibits California businesses from knowingly discharging significant amounts of listed chemicals into sources of drinking water.

On the federal level, U.S. EPA announced on January 19, 2021 that it is considering whether to designate PFOA and PFOS as hazardous substances under the Comprehensive Environmental Responsibility and Liability Act (CERCLA) and/or hazardous waste under the Resource Conservation and Recovery Act (RCRA). On February 22, 2021, U.S. EPA announced its proposed revisions to the Unregulated Contaminant Monitoring Rule (UCMR 5) for public water systems which includes monitoring for 29 PFAS in drinking water. The proposal would require pre-sampling preparations in 2022, sample collection from 2023-2025, and reporting of final results through 2026. Comments on U.S. EPA's proposal will be due within 60 days after it is published in the Federal Register. On March 3, 2021, U.S. EPA published its final regulatory determination to regulate PFOA and PFOS in drinking water. EPA has 24 months to propose maximum contaminant level goals (MCLG) and MCLs for PFOA and PFOS. Following that deadline, EPA has 18 months to publish final MCLGs and MCLs for PFOA and PFOS.

PFOA and PFOS were introduced in the 1940s and widely used in firefighting foams and in grease and stain-resistant, non-stick coatings in a variety of consumer products such as food paper packaging, carpets, furniture and cookware. The main route of exposure to PFOA and PFOS is through ingestion. While consumer products have been a large source of exposure to these chemicals for most people, drinking water has become an increasing concern due to the persistence of PFAS chemicals in the environment and their tendency to accumulate in groundwater. Groundwater contamination typically has been associated with an industrial facility where these chemicals were manufactured or used in other products, such as airfields and military bases where the chemicals have been used for firefighting or in areas near landfills that accept items containing PFAS.

Metropolitan has not detected PFOA or PFOS in its raw water. In 2019, Metropolitan detected in its supplies low levels of PFHxA, which is not acutely toxic or carcinogenic and is not currently regulated in California or at the federal level. No other PFAS have been detected in Metropolitan's imported or treated supplies. However, some of its member agencies have experienced detections in their groundwater wells. As DDW moves to establish MCLs for PFOA and PFOS, Metropolitan's member agencies may be confronted with the choice of implementing treatment or inactivating their affected sources to remain in compliance with DDW regulations. This may cause those systems to supplement their water needs with increased purchases of Metropolitan water.

1,4-Dioxane

1,4-dioxane has been used as a stabilizer for solvents, in particular 1,1,1- trichloroethane (TCA), and a solvent in its own right, as well as in a number of industrial and commercial applications. 1,4-dioxane is an emerging contaminant. In response to the occurrence data and potential adverse health effects, a notification level for 1,4-dioxane of 1 µg/L was established. The response level for 1,4-dioxane is 35 µg/L.

The SWRCB set a notification level of 1 µg/L for 1,4-dioxane in drinking water in November 2010, revising an earlier notification level of 3 µg/L set in March 1998 that was based on a risk determination by the U.S. EPA and concurrence from OEHHA. In August 2010, U.S. EPA revised its 1,4-dioxane risk evaluation, lowering the recommended levels in drinking water by nearly 10-fold to 0.35 µg/L. Following U.S. EPA's reevaluation of risk, the SWRCB revised the notification level to 1 µg/L in November 2010, considering analytical limitations at the time. On January 22, 2019, the SWRCB asked OEHHA to establish a PHG for 1,4-dioxane. OEHHA's PHG will be used by the SWRCB to set an MCL for 1,4-dioxane in drinking water.

Advanced oxidation treatment is currently the water industry's preferred treatment technology for 1,4-dioxane. However, DDW has not yet adopted a Best Available Technology for 1,4-dioxane treatment.

There are currently 90 wells in Los Angeles County and 21 wells in Orange County that have detected 1,4-dioxane over the NL in the last three years.[12]

Other Water Quality Programs

In addition to monitoring for and controlling specific identified chemicals in the water supply, Metropolitan has undertaken several programs to protect the quality of its water supplies. These programs are summarized below.

Source Water Protection

Source water protection is the first step in a multi-barrier approach to provide safe and reliable drinking water. In accordance with California's Surface Water Treatment Rule, Title 22 of the California Code of Regulations, DDW requires large utilities delivering surface water to complete a Watershed Sanitary Survey every five years to identify possible sources of drinking water contamination, evaluate source and treated water quality, and recommend watershed management activities that will protect and improve source water quality. The most recent sanitary surveys for Metropolitan's water sources are the Colorado River Watershed Sanitary Survey – 2015 Update and the State Water Project Watershed Sanitary Survey – 2016 Update.[13] The next Sanitary Surveys for the watersheds of the Colorado River and the SWP will report on watershed and water quality issues through 2020.

Metropolitan has an active source water protection program and continues to advocate on numerous issues to protect and enhance SWP and Colorado River water quality. As part of its source water protection program, Metropolitan monitors and forecasts source water quality, including closely monitoring the biology and limnology of lakes and aqueducts. Monitoring is conducted to comply with regulatory requirements, respond to water quality events, assess temporal variability, advise operations, and investigate emerging constituents and invasive species.

Colorado River Water Quality Partnerships

Metropolitan collaborates with external partners to asses and manage watershed threats to Colorado River water quality. Metropolitan is a member of the Clean Colorado River Sustainability Coalition, which was formed in 1997 and focuses on protecting and enhancing the Colorado River through monitoring and analysis of water quality to assure and sustain high quality water for all users of the Colorado River. In 2011, Metropolitan formed the Lower Colorado River Water Quality Partnership with SNWA and Central Arizona Project to identify and implement collaborative solutions to address water quality issues facing the Colorado River. Metropolitan also participated in the Lake Mead Water Quality Forum, which was formed in 2012, and its Lake Mead Ecosystem Monitoring Workgroup subcommittee. The Lake Mead Water Quality Forum's goals were to support the protection of human health and the environment and to preserve and improve the water quality of the Las Vegas Wash, Las Vegas Bay, and Lake Mead (and as a

[13] Metropolitan Water District of Southern California, ***Colorado River Watershed Sanitary Survey, 2015 Update***. For the State Water Project, the sanitary survey report was prepared on behalf of the State Water Project Contractors Authority, in 2016, and was titled ***California State Water Project 2016 Watershed Sanitary Survey Update***.

result, the Colorado River). In addition, as discussed earlier, Metropolitan is a member of the Colorado River Basin Salinity Control Forum which facilitates coordination between Basin states and federal agencies on salinity matters and the implementation of the Colorado River Basin Salinity Control Program.

SWP Water Quality Programs

Metropolitan supports DWR policies and programs aimed at maintaining or improving the quality of SWP water delivered to Metropolitan. In particular, Metropolitan supported the DWR policy to govern the quality of non-project water conveyed by the California Aqueduct. In addition, Metropolitan has supported the expansion of DWR's Municipal Water Quality Investigations Program beyond its Bay-Delta core water quality monitoring and studies to include enhanced water quality monitoring and forecasting of the Delta and SWP. These programs are designed to provide early warning of water quality changes that will affect treatment plant operations both in the short-term (hours to weeks) and up to seasonally. The forecasting model is currently suitable for use in a planning mode. It is expected that with experience and model refinement, it will be suitable to use as a tool in operational decision making.

Metropolitan has implemented selective withdrawals from storage programs and exchanges to improve water quality. Although these programs were initially designed to provide dry-year supply reliability, they can also be used to store SWP water at periods of better water quality so the stored water may be withdrawn at times of lower water quality, thus diluting SWP water deliveries. Although elevated arsenic levels have been a concern in one groundwater banking program, there are also short-term water quality benefits that can be realized through storage programs, such as groundwater pump-ins into the California Aqueduct with lower TOC levels (as well as lower bromide and TDS, in some programs).

Regulatory and Legislative Actions

Metropolitan conducts technical reviews of regulatory and legislative actions that may have an effect on the quality of Metropolitan's source waters. These may include changes in federal and state water quality standards; California Environmental Quality Act (CEQA) documents for projects or programs within Metropolitan's source watersheds; National Pollutant Discharge Elimination System permits for wastewater discharges into the Delta or Colorado River systems; and regulations or statewide policies and permits affecting source water quality or reservoir management issues.

In addition, Metropolitan advocates and provides funding requests for key source water protection priorities, including the Moab uranium tailings cleanup and Colorado River salinity control. In 2020, Metropolitan also co-sponsored SB 996 with the California Municipal Utilities Association to establish a statewide CEC program, which has been re-introduced as SB 230 in 2021's legislative session.

This page intentionally left blank.

Coordination and Public Outreach 5

Collaborative Regional Planning

Southern California meets its water challenges through collaborative long-range planning, bringing local perspectives and data together with expert knowledge of hydrology, climate change, demographics, and economics. Metropolitan's 2020 Urban Water Management Plan (UWMP) was developed as part of the ongoing 2020 Integrated Water Resources Plan (IRP) planning process and provides a representation of Metropolitan's planning elements reported under the conditions required by the Act. Together, these plans serve as the reliability road map for the region. The planning process involved extensive coordination with Southern California's wholesale and retail water agencies, as well as municipal service providers and public planning agencies. Outreach efforts sought to engage the general public, businesses, environmental organizations, diverse communities, cities, counties, and other stakeholders with an interest in the future of Southern California's water supplies.

This chapter describes how Metropolitan's process to develop the 2020 UWMP, Appendix 11 to the 2015 UWMP, and Water Shortage Contingency Plan (WSCP) complies with the provisions for coordination and public outreach in the Urban Water Management Planning Act included as part of the California Water Code (CWC) §10610, et seq.

Concurrent Planning with the 2020 Integrated Water Resources Plan

Metropolitan and its member agencies used a scenario planning approach for the 2020 IRP. Instead of focusing on a target for future water supply needs, this approach encouraged broader thinking and discussion on possible future conditions for local and imported water supply and retail demand, and the policy implications for Metropolitan. Adaptive management during implementation will allow flexibility in how the region prepares for the supply and demand conditions that are becoming more likely. The planning started with identifying drivers of change for water supply and demand, understanding how they interact, and then assessing the potential scale of impact in the future. Data sources were identified that could be used for quantitative and qualitative analysis. The detailed analyses of future local and imported water supplies; economic growth, demographics and water demands; and changing hydrology were incorporated into the 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP. The IRP planning effort and policy discussions continued into 2021.

Board of Directors Oversight

Metropolitan's Board of Directors provided oversight throughout the ongoing process for the development of the 2020 IRP that informed the preparation of the 2020 UWMP. The Board established the Integrated Resources Plan Special Committee (IRP Committee) to provide focused involvement of the Metropolitan Board for the preparation of these plans. The IRP Committee has 14 members, and all Board members are invited to attend and participate in discussions. The meetings are held online due to COVID-19 concerns. They are open to the public, and the public is invited to provide comments at each meeting. The IRP Committee held 12 meetings between February 2020 and March 2021, as summarized in Table 5-1.

Table 5-1
Summary of Metropolitan Board of Directors IRP Committee Meetings

Date	Committee	Topic
February 25, 2020	IRP Committee	Overview of the planning process, introduction to scenario planning, identify major policy areas
April 28, 2020	IRP Committee	Review process and scenario planning, identify relevant policy questions
May 26, 2020	IRP Committee	Review schedule, overview of stakeholder outreach
June 23, 2020	IRP Committee	Discuss drivers of change and method for constructing scenarios
July 28, 2020	IRP Committee	Qualitative and quantitative assessment for scenarios, collaboration with member agencies
August 17, 2020	IRP Committee	IRP purpose and benefit; development of an example scenario
September 22, 2020	IRP Committee	Draft scenarios and analysis
October 27, 2020	IRP Committee	Scenario assumptions and preliminary analysis of drivers
December 15, 2020	IRP Committee	Draft retrospective of the 2015 IRP, preliminary gap analysis and policy implications of the 2020 IRP
January 26, 2021	IRP Committee	Comments and feedback on 2015 IRP retrospective report, 2020 IRP policy discussion
February 23, 2021	IRP Committee	Policy discussion on portfolio development, preparation for workshops with demand and climate experts
March 23, 2021	IRP Committee	Workshop with water demand experts

Coordination with Member Agencies and Other Organizations

Metropolitan coordinated the preparation of the 2020 UWMP, Appendix 11 to the 2015 UWMP, and the WSCP with its 26 member agencies, wastewater management agencies, municipal service providers, groundwater management agencies, cities and counties within which Metropolitan provides water supplies, and regional planning agencies. The extensive regional coordination is consistent with the requirements of CWC Sections 10610.2(a)(4), 10620(d)(3), 10621(b), 10641, and 10642. With the WSCP initially included as part of the 2020 UWMP and the content of Appendix 11 to the 2015 UWMP the same as the content of Appendix 11 to the 2020 UWMP, the required coordination, notification, hearing, and adoption of the WSCP and Appendix 11 to the 2015 UWMP were accomplished side by side and concurrently with the 2020 UWMP process. Additionally, the WSDM Plan and WSAP, which are planning components included as part of the WSCP, were previously developed through extensive coordination with member agencies and various stakeholders and adopted by Metropolitan's Board in 1999 and 2008, respectively, and subsequent revisions to the WSAP were adopted in 2009, 2010, 2011, and 2014.

Metropolitan collaborated with its member agencies through the Member Agency Managers meetings and an IRP Member Agency Technical Workgroup, as well as the UWMP Coordination Meetings with member agencies and other appropriate agencies. These meetings provided an opportunity to share information, discuss scenario development and data analysis, and review draft analyses of future supply and demand. A summary of the meetings is provided in Table 5-2. In addition, Metropolitan staff met with member agency staff individually and provided presentations to member agency boards upon request.

Work with the member agencies was structured to complement presentations and discussions with the IRP Committee. Presentations and discussions with the Member Agency Technical Workgroup were incorporated into the following Member Agency Managers meetings. The feedback from the Member Agency Managers was then used to develop the presentations for the upcoming IRP Committee meetings. The Committee discussion and direction provided to staff informed the preparation of analysis and materials for the next Member Agency Technical Workgroup. This iterative process allowed for regular input and discussion, an essential element of scenario planning.

The first step in the planning process was to identify the drivers of change, those external factors that could impact future water supply and demand for the region. Over several months, Metropolitan worked with the Board, member agencies, stakeholders and the public to identify a broad range of drivers, understand how the drivers interact, and assess the potential scale of impact on water supply and demand. An important part of the discussion focused on how the impact of drivers could be evaluated qualitatively and quantitatively. The member agencies made recommendations on data and methodologies that could be used, and the draft analyses led to refinements.

Using the requirements for the UWMP, Metropolitan analyzed the data provided by the member agencies, other regional planning organizations such as SCAG and SANDAG, the California Department of Water Resources, and the U.S. Bureau of Reclamation. Local and imported water supplies were included, as well as demand management programs, regulations, and public acceptance of conservation as a way of life. Metropolitan prepared the data in five-year increments for conditions under normal water year, single dry year, and for droughts lasting at least five years as required in CWC Section 10631. The analyses were shared with the member agencies for their feedback, and to assist with their preparation and adoption of their plans. When requested, Metropolitan staff met individually with the member agencies to review the data sets and discuss any agency-specific questions or issues. Regional issues and analysis methodologies were discussed during the technical workgroup meetings and the Member Agency Managers meetings. Preliminary estimates of demand and supply were included in the Final Draft 2020 UWMP and draft Appendix 11 to the 2015 UWMP distributed to the member agencies in December 2020. Further refinements of demand and supply estimates were included in the Public Review drafts of the 2020 UWMP and draft Appendix 11 to the 2015 UWMP that were prominently posted on Metropolitan's website in February 2021, March 2021, and April 2021.

Public Outreach during IRP/UWMP/Appendix 11/WSCP Preparation

Metropolitan involved environmental and non-governmental organizations, businesses, academia, diverse communities, and the public in the preparation of the IRP, 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP. Public outreach provides an invitation and a means for the public to provide input on the region's future water supply reliability. Metropolitan's three key objectives for public involvement in the preparation of the 2020 IRP, 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP are as follows:

- Ensure that the planning process is understandable and accessible to anyone who has an interest in Southern California's water resources and water supply reliability
- Provide opportunities for learning, dialogue, and input
- Create a pathway to encourage continued engagement in future policy discussions

"Water Tomorrow" is Metropolitan's brand to build awareness of long-range planning efforts and programs for water reliability. The website MWDWaterTomorrow.com links the IRP, 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP. It provides key information on the IRP and IRP Committee presentations, as well as notice of stakeholder workshops. Metropolitan shares news and updates about the IRP and UWMP through Metropolitan's e-newsletter and social media on several platforms. Metropolitan also provides speakers for community, governmental and business organizations throughout its service area.

To encourage public involvement during the planning process, Metropolitan held two public workshops in May 2020 using an online platform due to COVID-19 concerns. The workshops introduced the scenario planning approach and focused on drivers of change, opening up dialogue and discussion among stakeholders across the region. Over 500 stakeholders participated, sharing their ideas on what could drive future water supply and demand conditions. Throughout the planning process the public was invited to provide comments at each IRP Committee meeting and to view the presentations and listen to the board discussions.

The third outreach objective looks to the future. One of Metropolitan's overarching communication goals is to develop the general public's knowledge of water resource issues and the range of solutions available to Southern California. An informed public is better able to contribute to the discussions and understand the implications and opportunities afforded by decisions. Metropolitan is building on the momentum for the IRP, 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP planning efforts to encourage continued public involvement in water issues. Stakeholders will continue to receive updates through MWDWaterTomorrow.com, social media, and e-news.

2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP Public Notice and Adoption

CWC Section 10632 requires urban water suppliers to prepare a detailed WSCP. While the WSCP is its own independent plan that may be revised at any point in time, it is initially included as part of the 2020 UWMP.

Metropolitan provided notice of the availability of the draft 2020 UWMP (including Appendix 11 which will also be a new Appendix 11 to its 2015 UWMP) and the WSCP, and notice of the public hearing to consider adoption of both plans and Appendix 11 as an addendum to its 2015 UWMP, in accordance with CWC Sections 10621(b) and 10642, and Government Code Section 6066, and Chapter 17.5 (starting with Section 7290) of Division 7 of Title 1 of the Government Code. The public review drafts of the 2020 UWMP, Appendix 11 to the 2015 UWMP, and the WSCP were posted prominently on Metropolitan's website, mwdh2o.com, on February 1, 2021, more than 60 days in advance of the public hearing on April 12, 2021. The notice of availability of the documents was sent to Metropolitan's member agencies, as well as to cities and counties in Metropolitan's service area. In addition, a public notice advertising the public hearing in English and Spanish was published in 12 Southern California newspapers. The notification in English language newspapers was published on February 1 and 8, 2021. The notification was also published on January 28-30, 2021 and February 1, 4-6, and 8, 2021 in Spanish language newspapers, satisfying the requirement for non-English language notification. Copies of: (1) the notification letter sent to the member agencies, cities and counties in Metropolitan's service area, and (2) the notice published in the newspapers are included in this section. Table 5-3 provides a list of participating member agencies and other appropriate agencies that Metropolitan coordinated with in its regional planning, as well as the cities and counties that were notified about the preparation of its 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP. In addition, the list of newspaper publications is included in Table 5-4.

Metropolitan held the public hearing for the draft 2020 UWMP, draft Appendix 11 to the 2015 UWMP, and draft WSCP on April 12, 2021, at the Board's Water Planning and Stewardship Committee meeting, held online due to COVID-19 concerns. On May 11, 2021, Metropolitan's Board determined that the 2020 UWMP and the WSCP are consistent with the Act and accurately represent the water resources plan for Metropolitan's service area. In addition, Metropolitan's Board determined that Appendix 11 to both the 2015 UWMP and the 2020 UWMP includes all of the elements described in Delta Plan Policy WR P1, Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance (Cal. Code Regs. tit. 23, § 5003) which need to be included in a water supplier's UWMP to support a certification of consistency for a future covered action. As stated in Resolutions 9279, 9280, and 9281, the Board adopted the 2020 UWMP, Appendix 11 to the 2015 UWMP, and the WSCP, and authorized their submittal to the State of California. Copies of Resolutions 9279, 9280, and 9281 are included in this section.

Submission and Availability of Final 2020 UWMP, Appendix 11 to 2015 UWMP, and WSCP

In fulfillment of CWC Sections 10632(c) and 10645(a) and (b), Metropolitan's final 2020 UWMP, Appendix 11 to its 2015 UWMP, and its WSCP were posted on the mwdh2o.com website in May 2021, following their adoption by the Metropolitan Board. This satisfies the requirement to make the plans available for public review and to make the WSCP available to Metropolitan's customers (which are its member agencies).

In fulfillment of CWC Sections 10632(c), 10635(c), and 10644(a)(1), Metropolitan also mailed copies of the final 2020 UWMP, Appendix 11 to the 2015 UWMP, and the WSCP (in electronic pdf format) to the California State Library and all cities and counties within Metropolitan's service area within 30 days of Board adoption.

In fulfillment of CWC Section 10621(f) and Sections 10644(a)(1), (2), and (b), Metropolitan's final 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP were electronically submitted to the State of California through DWR's WUE data website https://wuedata.water.ca.gov/secure/ in June 2021.

Notice of Public Hearing on The Metropolitan Water District of Southern California's Draft 2020 Urban Water Management Plan (UWMP), Draft Appendix 11 to the 2015 UWMP, and Draft Water Shortage Contingency Plan

The Metropolitan Water District of Southern California (Metropolitan) cordially invites you to participate and provide comments at a public hearing on the draft 2020 Urban Water Management Plan (UWMP), draft Appendix 11 as an addendum to the 2015 UWMP, and draft Water Shortage Contingency Plan (WSCP). The UWMP presents Metropolitan's long-term plan for ensuring water supply reliability and water quality for the region. The draft 2020 UWMP complies with California state law requiring urban water suppliers to prepare and update urban water management plans every five years. The draft WSCP includes Metropolitan's efficient management and planned actions to respond to actual water shortage conditions. Metropolitan's WSCP satisfies the requirements of the California Water Code. The draft Appendix 11 to both the 2015 UWMP and the 2020 UWMP includes all of the elements described in Delta Plan Policy WR P1, Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance (Cal. Code Regs. tit. 23, § 5003) which need to be included in a water supplier's UWMP to support a certification of consistency for a future covered action. The hearing will be held as part of the meeting of the Water Planning and Stewardship Committee whose board members are helping to shape a public dialogue on the future of water management and conservation in the region. The meeting details are as follows:

> **Water Planning and Stewardship Committee Meeting**
> **Monday, April 12, 2021 at 10:00 AM**
> **(expected time; please confirm time 7 days prior to meeting)**
> **Teleconference Participation Only**
> **No Physical Meeting Location**
>
> As a result of the COVID-19 emergency and the Governor's Executive Orders to protect public health by limiting public gatherings and requiring social distancing, at this time, this meeting is scheduled to occur via remote presence.
>
> The Water Planning and Stewardship Committee meeting will be live streamed and recorded and may be accessed using the following link:
> http://www.mwdh2o.com/WhoWeAre/Board/Board-Meeting/Pages/default.aspx.
> (Please check this website for final time of the Public Hearing.)

The draft 2020 UWMP, draft Appendix 11 to the 2015 UWMP, and draft WSCP are posted on Metropolitan's website, mwdh2o.com, for your review. Public input is encouraged and will be considered during finalization of the 2020 UWMP, Appendix 11 to the 2015 UWMP, and WSCP. Written comments are due by **April 12, 2021**.

If you would like to get more information or send comments, please contact Edgar Fandialan at efandialan@mwdh2o.com.

Very Truly Yours,
Brad Coffey
Manager, Water Resource Management Group

(Published on February 1 and 8, 2021 for English language newspapers and January 28-30, 2021 and February 1, 4-6, and 8, 2021 for Spanish language newspapers per California Water Code § 10642, Government Code § 6066, and Chapter 17.5 of the Government Code)

PUBLIC HEARING SCHEDULED ON

DRAFT 2020 URBAN WATER MANAGEMENT PLAN, DRAFT APPENDIX 11 TO 2015 URBAN WATER MANAGEMENT PLAN, AND DRAFT WATER SHORTAGE CONTINGENCY PLAN

The Metropolitan Water District of Southern California (Metropolitan) will hold a public hearing on **Monday, April 12, 2021** to receive comments on its draft 2020 Urban Water Management Plan (UWMP), draft Appendix 11 as an addendum to its 2015 UWMP, and its draft Water Shortage Contingency Plan (WSCP).

The hearing will be held as part of the meeting of the Water Planning and Stewardship Committee whose board members are helping to shape a public dialogue on the future of water management and conservation in the region. The meeting is at:

Water Planning and Stewardship Committee Meeting
Monday, April 12, 2021 at 10:00 AM
Teleconference Participation Only
No Physical Meeting Location

As a result of the COVID-19 emergency and the Governor's Executive Orders to protect public health by limiting public gatherings and requiring social distancing, at this time, this meeting is scheduled to occur via remote presence.

The Water Planning and Stewardship Committee meeting will be live streamed and recorded and may be accessed using the following link:
http://www.mwdh2o.com/WhoWeAre/Board/Board-Meeting/Pages/default.aspx.
(Please check this website for final time of the Public Hearing.)

The UWMP presents Metropolitan's long-term plan for ensuring water supply reliability and water quality for the region. The draft 2020 UWMP complies with California state law requiring urban water suppliers to prepare and update urban water management plans every five years. The draft Appendix 11 to both the 2020 UWMP and the 2015 UWMP includes all of the elements described in Delta Plan Policy WR P1, Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance (Cal. Code Regs. tit. 23, § 5003) which need to be included in a water supplier's UWMP to support a certification of consistency for a future covered action. The draft WSCP includes Metropolitan's efficient management and planned actions to respond to actual water shortage conditions. Metropolitan's draft WSCP satisfies the requirements of the California Water Code.

The draft 2020 UWMP, draft Appendix 11, and the draft WSCP are available on Metropolitan's website, mwdh2o.com. Public input is encouraged and will be considered during finalization of the 2020 UWMP, Appendix 11, and the WSCP. Metropolitan will accept written comments on the draft plans and draft Appendix 11. All written comments must be received by **April 12, 2021**.

To send comments or for more information on the draft 2020 UWMP, draft Appendix 11, and draft WSCP, please contact Edgar Fandialan of Metropolitan's Water Resource Management Group at efandialan@mwdh2o.com.

Resolution 9279

RESOLUTION
OF THE BOARD OF DIRECTORS
OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA
ADOPTING THE 2020 URBAN WATER MANAGEMENT PLAN

WHEREAS, the Urban Water Management Planning Act requires urban water suppliers providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually to prepare and adopt, in accordance with prescribed requirements, an urban water management plan every five years; and

WHEREAS, the Urban Water Management Planning Act specifies the requirements and procedures for adopting such urban water management plans; and

WHEREAS, the Board of Directors of The Metropolitan Water District of Southern California has duly reviewed, discussed, and considered the 2020 Urban Water Management Plan and has determined the 2020 Urban Water Management Plan to be consistent with the Urban Water Management Planning Act and to be an accurate representation of the water resources plan for The Metropolitan Water District of Southern California.

NOW, THEREFORE, BE IT RESOLVED by the Board of Directors of The Metropolitan Water District of Southern California that, on May 11, 2021, this District hereby adopts this 2020 Urban Water Management Plan for submittal to the State of California.

I HEREBY CERTIFY that the foregoing is a full, true and correct copy of a resolution adopted by the Board of Directors of The Metropolitan Water District of Southern California, at its meeting held on May 11, 2021.

Judy Abdo

Secretary of the Board of Directors
of The Metropolitan Water District
of Southern California

Resolution Adopting the Appendix 11 Addendum to the 2015 Urban Water Management Plan

Resolution 9280

RESOLUTION
OF THE BOARD OF DIRECTORS
OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA
ADOPTING APPENDIX 11 AS AN ADDENDUM TO THE 2015 URBAN WATER MANAGEMENT PLAN

WHEREAS, the Urban Water Management Planning Act requires urban water suppliers providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually to prepare and adopt, in accordance with prescribed requirements, an urban water management plan every five years; and

WHEREAS, the Urban Water Management Planning Act specifies the requirements and procedures for amending and adopting such urban water management plans; and

WHEREAS, the Board of Directors of The Metropolitan Water District of Southern California has duly reviewed, discussed, and considered Appendix 11 as an addendum to Metropolitan's 2015 Urban Water Management Plan and has determined Appendix 11 to be consistent with the Urban Water Management Planning Act and includes all of the elements described in Delta Plan Policy WR P1, Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance (Cal. Code Regs., tit. 23, § 5003, subd. (c)(1)) which need to be included in a water supplier's urban water management plan to support a certification of consistency for one or more future water supply covered actions in the Sacramento-San Joaquin Delta.

NOW, THEREFORE, BE IT RESOLVED by the Board of Directors of The Metropolitan Water District of Southern California that, on May 11, 2021, this District hereby adopts this Appendix 11 to the 2015 Urban Water Management Plan for submittal to the State of California.

I HEREBY CERTIFY that the foregoing is a full, true and correct copy of a resolution adopted by the Board of Directors of The Metropolitan Water District of Southern California, at its meeting held on May 11, 2021.

Judy Abdo

Secretary of the Board of Directors
of The Metropolitan Water District
of Southern California

Resolution Adopting the Water Shortage Contingency Plan

Resolution 9281

RESOLUTION
OF THE BOARD OF DIRECTORS
OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA
ADOPTING THE WATER SHORTAGE CONTINGENCY PLAN

WHEREAS, the Urban Water Management Planning Act requires urban water suppliers providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually to prepare and adopt, in accordance with prescribed requirements, a water shortage contingency plan;

WHEREAS, the Urban Water Management Planning Act specifies the requirements and procedures for adopting such Water Shortage Contingency Plans;

WHEREAS, the Urban Water Management Planning Act requires urban water suppliers to conduct an annual water supply and demand assessment (Annual Assessment) each year and to include in their water shortage contingency plans the procedures they use to conduct the Annual Assessment;

WHEREAS, the procedures used to conduct an Annual Assessment include, but are not limited to, the written decision-making process that an urban water supplier will use each year to determine its water supply reliability;

WHEREAS, The Metropolitan Water District of Southern California's (Metropolitan's) water shortage contingency plan provides that by June of each year, Metropolitan staff will present a completed Annual Assessment for approval by Metropolitan's Board of Directors or by the Board's authorized designee with expressly delegated authority for approval of Annual Assessment determinations;

and

WHEREAS, the Board of Directors of The Metropolitan Water District of Southern California has duly reviewed, discussed, and considered such Water Shortage Contingency Plan and has determined the Water Shortage Contingency Plan to be consistent with the Urban Water Management Planning Act and to be an accurate representation of the planned actions during shortage conditions for The Metropolitan Water District of Southern California.

NOW, THEREFORE, BE IT RESOLVED by the Board of Directors of The Metropolitan Water District of Southern California that, on May 11, 2021, this District hereby adopts this Water Shortage Contingency Plan for submittal to the State of California and expressly authorizes the General Manager of The Metropolitan Water District of Southern California to approve the Annual Assessment each year.

I HEREBY CERTIFY that the foregoing is a full, true and correct copy of a resolution adopted by the Board of Directors of The Metropolitan Water District of Southern California, at its meeting held on May 11, 2021.

Appendix 1

DEMAND FORECAST

Appendix 1
DEMAND FORECAST

Forecast Overview

Retail water demand forecasting is essential for planning total water requirements in Metropolitan's service area. Retail water demand can be met with conservation, local supplies, or imported supplies. As a wholesale imported water supplier, Metropolitan's long-term plans focus on the future demands for Metropolitan's supplies. In order to project the need for resources and system capacity, Metropolitan begins with a long-term projection of retail water demands.

Total retail demands include:

- Retail Municipal and Industrial (M&I) — Retail M&I demands represent urban water use within the region including residential, commercial, industrial, and institutional water uses. To forecast retail M&I demands, Metropolitan uses econometric models that have been adapted for conditions in Southern California. The econometric models are statistical models that can capture and explain the impacts of long-term socioeconomic trends on retail M&I demands. The econometric models incorporate projections of demographic and economic variables from regional transportation planning agencies to produce forecasts of water demand.
- Retail Agricultural Demand — Retail agricultural demands consist of water use for irrigating crops. Metropolitan's member agencies provide projections of agricultural water use based on many factors, including farm acreage, crop types, historical water use, and land use conversion. Metropolitan relies on member agencies' projections of agricultural demands.
- Seawater Barrier Demand — Seawater barrier demands represent the amount of water needed to hold back seawater intrusion into the coastal groundwater basins. Groundwater management agencies determine the barrier requirements based on groundwater levels, injection wells, and regulatory permits.
- Replenishment Demand — Replenishment demands represent the amount of water member agencies plan to use to replenish their groundwater basins in order to maintain sustainable basin health and production.

Retail M&I Demand Forecast

In forecasting retail M&I water demand, Metropolitan utilizes an econometric model (the Metropolitan Water District – Econometric Demand Model or MWD-EDM) developed by The Brattle Group (January 2015). MWD-EDM utilizes multiple regression, which is generally favored by academics and practitioners for long-term water demand analysis. It uses demand relationships based on actual observed behavior to consider the effect of anticipated changes in demand factors on long-term demand.

MWD-EDM is comprised of three separate regression models described below. Each model is developed using historical water consumption, socio-demographic, and economic data specific to the sector:

- Single-Family Residential (SFR) Model — SFR water demand is modeled as a function of price, weather, retailer level housing, socio-demographic characteristics, and member agency level fixed effects. The model used water consumption data from 153 retailers with 3,000 accounts or more in Metropolitan's service area. The dataset, ranging from 1994 to 2011, consisted of 1,225 observations and represented 80 percent of all SFR accounts from all 26 Metropolitan member agencies.

- Multi-family Residential (MFR) Model — MFR demand is modeled as a function of price, retailer level housing, socio-demographic characteristics, and member agency level fixed effects. Water consumption data, ranging from 1994 to 2011, was collected from 53 water retailers consisting of 469 observations and representing 23 out of 26 Metropolitan member agencies.
- Commercial, Industrial, and Institutional (CII) Model — CII demand is modeled as a function of price, weather, employment, the share of employment in the manufacturing sector, and member agency level fixed effects. Water consumption data, ranging from 1994 to 2011, was collected from 75 water retailers consisting of 709 observations and representing 25 out of 26 Metropolitan member agencies.

The SFR and MFR models forecast average monthly household consumption before conservation, while the CII model forecasts average monthly consumption per employee. Table A.1-1 shows the dependent and the covariates uses in the econometric models for each sector.

Table A.1-1
MWD-EDM Variables

Sector	Dependent Variable	Independent Variable (Covariate)
SFR	Water-Use Per Household	Total Average Cost Total Average Cost x Median Lot Size Annual precipitation Average Max Temperature Median Income Average Household Size Median Lot Size
MFR	Water-Use Per Household	Median Tier Price Median Income Median Lot Size Average Household Size
CII	Water-Use Per Employee	Median Tier Price Cooling Degree Days Average Max Temperature Share of Employment In Manufacturing Median Tier Price x Share of Manufacturing

Total retail M&I demand is the product of projected household/employee and the average monthly consumption.

Price Elasticity

Price elasticity of demand is a measure used in economics to show the responsiveness of the quantity of water demanded to a change in its price. The assumed price increase reduces the water use. This reduction can be assessed in MWD-EDM and is considered a conservation savings due to price or "price-effect." Consumers can respond to price increases by installing water-conserving fixtures and appliances such as high-efficiency toilets. However, many of the fixture-based conservation savings options are already factored into Metropolitan's Conservation Savings Model. As more water efficient fixtures are installed, the impact of changing water using behavior through price or rates is reduced. Consider consumers who respond to rate increases by taking shorter showers. Their behavior adjustment will save less water if they use a water-efficient low-flow showerhead compared to a regular showerhead. This effect is known as demand hardening. In order to avoid double-counting conservation savings and account for demand hardening, the impact of price elasticity is reduced. In MWD-EDM, price elasticity is adjusted by 33 percent in 2019 and 66 percent by 2045. Price-effect savings are reduced (and demands increased) as a result of this adjustment. The elasticity is reduced in proportion to increases in conservation savings from the conservation model. Reducing price elasticity to 1/3 of its originally estimated levels is based on professional judgment, assuming that much of the easily obtained water use efficiencies will be achieved by 2020 but allowing for new conservation technologies.

Fixed Effects

MWD-EDM forecasts retail M&I demand for each of the 26 member agencies. To account for the differences observed between each agency, MWD-EDM uses the fixed effects or the constant term that represents the member agency specific intercepts that account for all time-invariant unobserved factors common to an agency.

Demographics

Demographics are recognized by the water industry as drivers of water demand. Metropolitan's retail demand modelling is driven by key demographics such as projected population, households, employment, and median household income.

Metropolitan uses demographic growth projections produced by two regional transportation planning agencies: Southern California Association of Governments (SCAG) and San Diego Association of Governments (SANDAG). Together they represent more than 200 cities in Southern California and produce long-term transportation plans for sustainable communities. Among other responsibilities, SCAG and SANDAG also prepare projections of population, households, income, and employment for their regions. Both planning agencies update their regional growth forecasts approximately every four years, at different times. SCAG is the regional planning agency for six counties: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SANDAG is the regional planning agency for San Diego County. Significantly, SCAG's and SANDAG's official growth projections are backed by environmental reports. These regional growth forecasts provide the core assumptions underlying Metropolitan's retail demand forecasting model.

In May 2020, SCAG approved the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) for federal transportation conformity purposes, certified the Connect SoCal program environmental impact report (PEIR), and delayed for up to 120 days approval of the plan for other purposes primarily due to the COVID-19 pandemic. This enabled SCAG to submit the plan to the Federal Highway Administration and Federal Transit Administration for review prior to the June 1, 2020, deadline, as required by the federal Clean Air Act. SCAG subsequently approved Connect SoCal in its entirety in September 2020. SCAG's related growth forecast (RTP-20) projects growth in employment, population, and households at the regional, county, jurisdictional, and sub-jurisdictional levels. The regional and county growth forecasts reflect recent and past trends and expert-derived demographic and economic assumptions for Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties. Metropolitan uses the forecast for every county except Imperial, which is outside of Metropolitan's service area. In preparing its demographic and growth forecast, Metropolitan relied on SCAG's 2020 Demographics and Growth Forecast Proposed Final Technical Report to the RTP/SCS. The report includes information on social factors affecting water management such as race, ethnicity, and cultures. As noted in SCAG's report, Southern California is one of the most diverse regions in the nation in race and ethnicity. Race and ethnicity are important for demographers to consider while forecasting since fertility and household formation have strong cultural underpinnings that vary based on these categories.

In October 2019, SANDAG adopted the San Diego Forward: The 2019 Federal Regional Transportation Plan that utilized Version 17 of the SANDAG Series 14 Regional Growth Forecast (SANDAG Series 14). The forecast is a comprehensive projection of the regional demographic, economic, and housing trends for the San Diego region that was developed through a collaborative effort with experts in demography, housing, the economy and other disciplines, and the close cooperation of the local planning directors and their staff. Metropolitan uses the forecast for the San Diego County Water Authority's service area in the retail demand forecast.

Effects of the COVID-19 Pandemic on SCAG's and SANDAG's Forecasts

Both SCAG and SANDAG's forecasts were developed prior to the advent of the COVID-19 global pandemic. For this reason, assumptions about the pandemic's effects on future growth are not reflected in the demographic forecast data used in this UWMP. Although long-term impacts are extremely uncertain, the region is currently experiencing acute and potentially lasting disruptions across a wide range of economic and lifestyle activities that in turn may unsettle pre-pandemic expectations for future household formation, migration, fertility, and life expectancy.

After approving Connect SoCal in May 2020 for the limited purpose of federal air quality conformity, SCAG engaged in a stakeholder outreach process to learn more from stakeholders about how they have been impacted by COVID-19 and learn how Connect SoCal could be better positioned as a tool for recovery and regional resilience. Activities included engagement with regional planning working groups, direct outreach to stakeholders, focus groups with community-based organizations, a public survey, and a public virtual townhall. Given the living nature of Connect SoCal and its existing focus on the need to develop regional resilience strategies targeting vulnerable communities, SCAG staff did not recommend specific modifications or clarifications to Connect SoCal in response to the pandemic at the time. Rather, staff recommended that policy changes and plan updates be considered through future board action informed by its implementation planning and regular processes for updating the Regional Transportation Plan/Sustainable Communities Strategy. With its September 2020 final adoption, SCAG accepted the Connect SoCal in its entirety without substantive changes to the growth forecast.

Forecasts Used by Metropolitan

Metropolitan uses the forecast approved by SCAG in May 2020. During the period between May and September 2020, the cities of Anaheim, Chino, Duarte, Malibu, and some unincorporated areas of Los Angeles and San Bernardino counties made adjustments to the forecast to reflect changes in their general plan capacities and entitlements. The total household change resulted in 0.29% of the region's Transportation Analysis Zones (TAZ) and jobs were shifted in 0.77% of TAZs. Given the timing and the small scale change in the forecast, Metropolitan continues to use the May 2020 release for its planning activities. For the San Diego region, Metropolitan uses a version of SANDAG Series 14 provided by the San Diego County Water Authority.

Trends in Southern California

Population

According to the California Department of Finance, the population in Metropolitan's service area was approximately 19.0 million in 2020. SCAG and SANDAG estimate the population in Metropolitan's service area will reach 20.1 million in 2025 and 22.0 million by 2045. The historical and projected population for the service area, by county, is shown in Figure A.1-1. While Los Angeles County leads in total population, the inland areas of Riverside and San Bernardino counties are projected to grow at the fastest rates over the next ten years. Generally speaking, however, annual growth rates will slow for all counties between 2010 and 2045. In part, this is due to changing patterns of migration, as well as aging of the overall population. It also reflects the effects of the recession of the late 2000s and the ongoing restructuring of the Southern California economy.

Employment

Within Metropolitan's service area, employment growth is likely to occur unevenly across the six counties. Over the 25-year period between 2020 and 2045, the greatest employment increases are expected to occur in Riverside, Los Angeles, and San Diego Counties with estimated increases of 208, 375, and 237 thousand jobs respectively. Relative to existing employment, Riverside and San Bernardino counties are expected to have the highest rates of employment growth.

Figure A.1-2 and Table A.1-3 summarize the projected growth of commercial, industrial, and institutional employment in Metropolitan's service area. The 2020 urban employment number includes the effects of the COVID-19 pandemic based on analysis by the California Employment Development Department (EDD). The EDD estimated a 7 percent decrease in employment in Metropolitan's service area from 2019 to 2020. Employment projections for 2021 through 2023 are based on recovery rates from the UCLA Anderson Forecast. Long-term employment is based on SCAG and SANDAG's forecasts. Total urban employment is expected to increase from 8.6 million in 2020 to about 10.3 million in 2045. This increase of about 12 percent is less than the projected population increase of 14 percent, suggesting a slight decrease in the employed population over time due to aging population.

Figure A.1-1 Actual and Projected Population

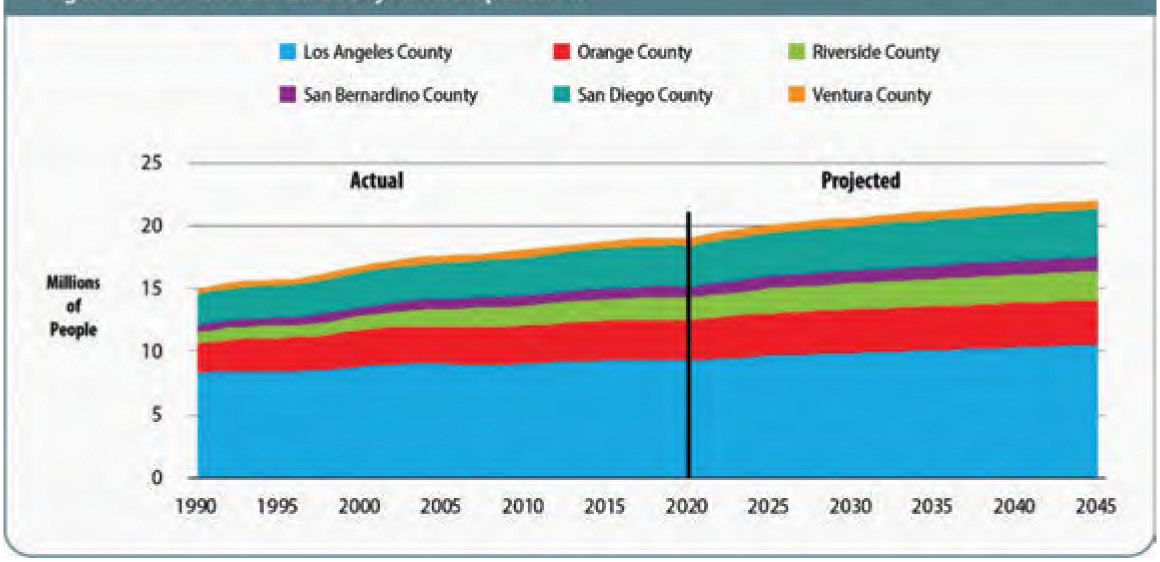

Figure A.1-2 Actual and Projected Urban Employment

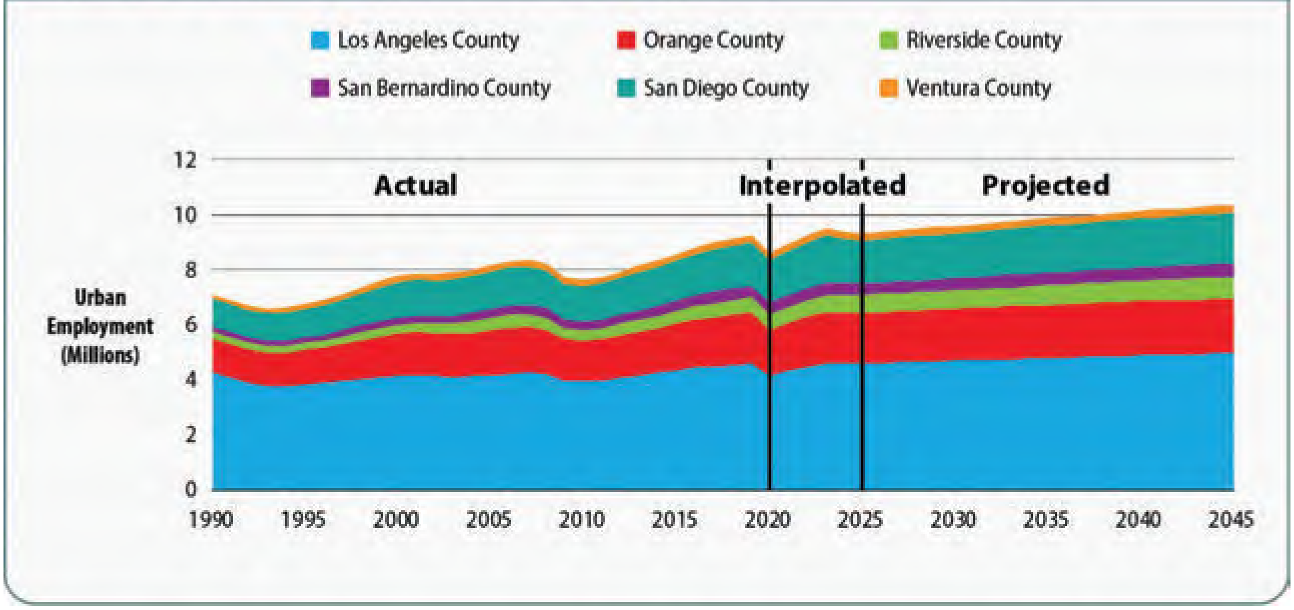

Residential Consumers

Southern California's regional planning agencies have forecast residential housing growth in all parts of the Metropolitan service area. These forecasts are shown in Figure A.1-3 and Table A.1-4. The total occupied housing stock is expected to increase more than 20 percent between 2020 and 2045, growing from 6.3 to around 7.6 million households. Much of this growth will likely occur in hotter inland areas of Southern California. Within the service territory, the household occupancy size (household population divided by total occupied dwelling units) is projected to decline slightly from about 3.0 persons per unit currently to 2.9 persons per unit by 2045.

Permits for new residential housing construction are another indicator of the future growth in water demand. Figure A.1-4 shows the pattern of historical growth in residential housing permits between 1970 and 2019. The effect of economic cycles can clearly be seen over time with the precipitous fall in housing construction during the 2007 to 2010 recession being most notable. Overall housing construction has made a modest recovery since 2011. However, in a departure from the previous trend since the late 1980s that favored single-family homes, new dwellings built since 2011 have been mostly multifamily units.

Figure A.1-3 Actual and Projected Households

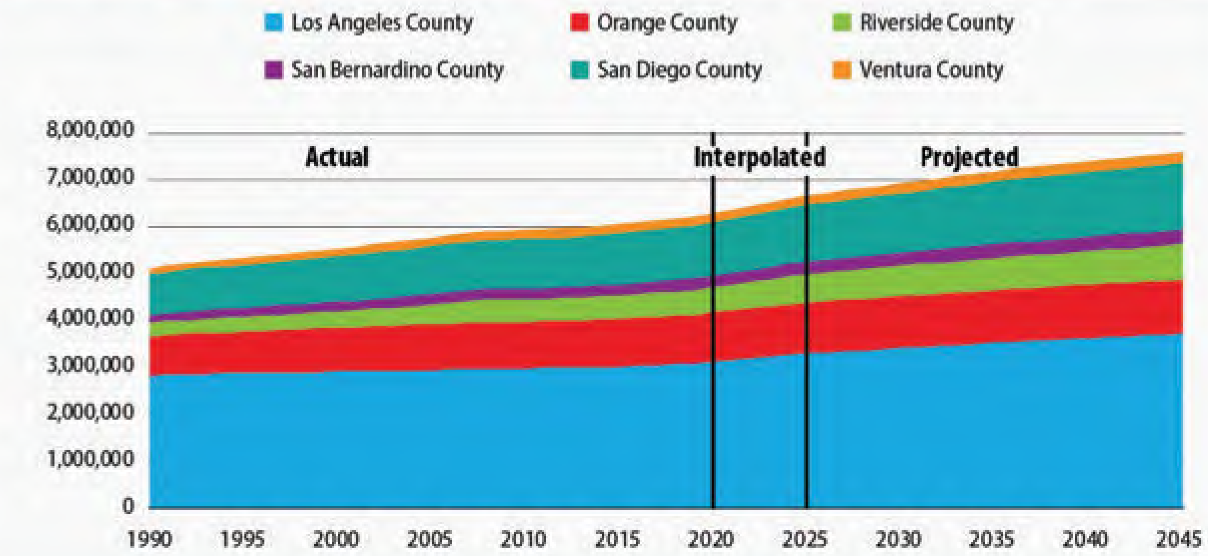

Figure A.1-4 Residential Housing Permits in Six-County Region

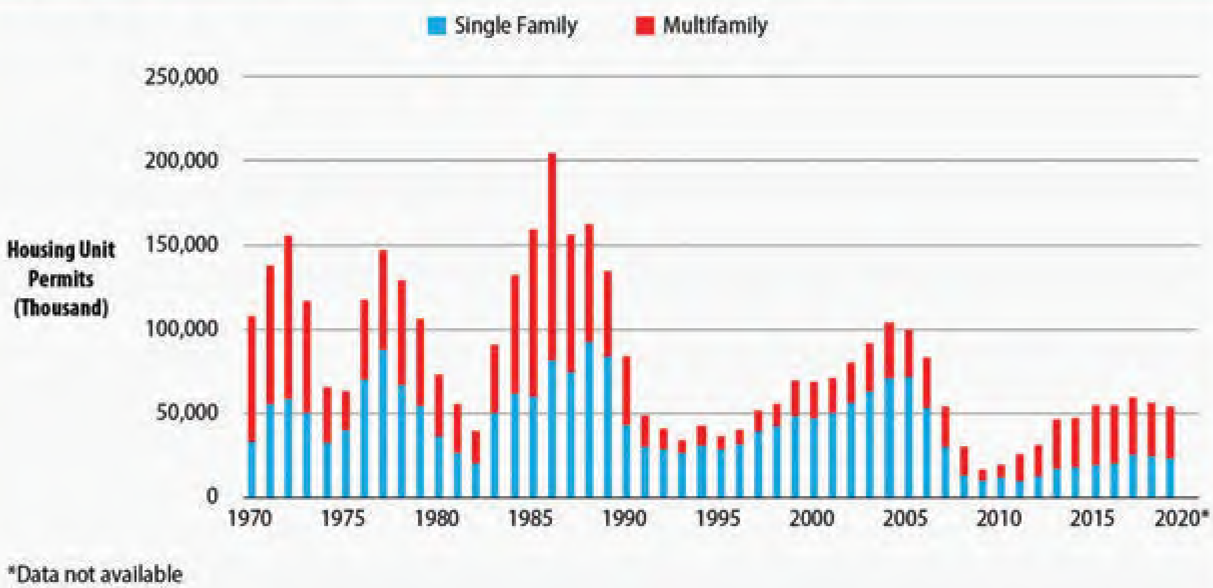


Water Demands

As shown in Figure A.1-5, actual retail municipal and industrial (M&I) water demands in 2019 were 2.92 million acre-feet (MAF), which is approximately the same as in 1983. This is due to a number of factors including a higher than normal precipitation, an aggressive outreach campaign and mandatory water use restriction in 2015. Water demand in 2020 is estimated to be 3.1 MAF. In addition, agricultural water use is estimated to be 144 TAF. Similar to M&I demand, agricultural demand was also impacted ty the 2015 drought restriction. By 2045, under average conditions, retail agricultural demand is expected to be about 123 TAF.

Retail Demand

It is estimated that total M&I water use will grow from 3.1 MAF in 2020 to 3.5 MAF in 2045. All water demand projections assume normal weather conditions. Future changes in estimated water demand assume continued water savings due to conservation measures such as water savings resulting from plumbing codes, price effects, and the continuing implementation of utility-funded conservation BMPs. Retail demand was greatly reduced in 2015 due to extraordinary response to statewide calls for a 25 percent reduction in water use in light of historic drought conditions. Between 2020 and 2045, regional water use will grow slowly as driven by population and economic growth while water use efficiency increases.

By County

M&I water demand is not expected to grow uniformly across counties. Consistent with the general pattern of future demographic distributions, the largest absolute increases in urban water demands are expected to occur in Los Angeles and Riverside Counties, with respective estimated increases of about 109 TAF and 108 TAF between 2020 and 2045.

By Sector

Water use can also be broken down by sector. Between 2020 and 2045, single-family residential water use is expected to increase by 9 percent (Table A.1-8), while multifamily water use is estimated to increase by 28 percent (Table A.1-9). Table A.1-10 shows estimated nonresidential water use decreasing by 5 percent between 2020 and 2045.

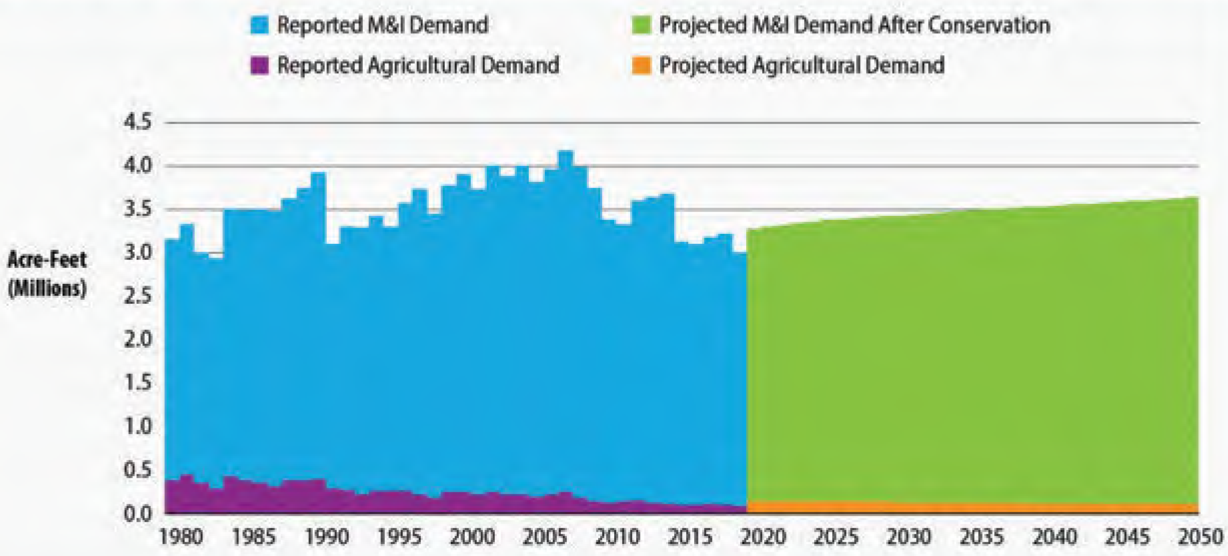
Residential Water Use

While single-family homes are estimated to account for about 60 percent of the total occupied household in 2020, they are responsible for about 75 percent of total residential water demands (Tables A.1-8 and A.1-9). This is consistent with the fact that single-family households are known to use more water than multifamily households (e.g., those residing in duplexes, triplexes, apartment buildings and condo developments) on a per housing-unit basis. This is because single-family households tend to have more persons living in the household; they are likely to have more water-using appliances and fixtures; and they tend to have more landscaping.

Nonresidential Water Use

Nonresidential water use represented approximately 18 percent of the total M&I demands in Metropolitan's service area in 2020 (Table A.1-10). This includes water that is used by businesses, services, government, institutions (such as hospitals and schools), and industrial (or manufacturing) establishments. Within the commercial/institutional category, the top water users include schools, hospitals, hotels, amusement parks, colleges, laundries, and restaurants. In Southern California, major industrial users include electronics, aircraft, petroleum refining, beverages, food processing, and other industries that use water as a major component of the manufacturing process.

Figure A.1-5 Actual and Projected Retail Water Demand



Conservation Savings

Table A.1-12 shows estimated conservation savings resulting from active conservation programs ("Active"), ongoing conservation from natural replacement of plumbing fixtures ("Code-Based"), and conservation induced by projected increases in the real price of water ("Price"). Code-Based savings account for the largest share of total conservation. However, aggressive utility-funded conservation programs have made a significant contribution in this area. For example, Metropolitan-assisted programs were responsible for an estimated 213 TAF in savings during FY 2019-20 and nearly 3.27 MAF in cumulative conservation savings since FY 1990/91.

Projected M&I Demand by Sector

Table A.1-13 provides a summary of municipal and industrial demands, broken down by sector, along with each sector's share of total retail demand. In 2020, residential use accounted for about 82 percent of total projected M&I demand, while non-residential use constituted nearly 18 percent of projected M&I demand. These shares are projected to have a slight increase on residential and a slight decrease on CII by about 2 percent in 2045. System losses and unmetered use are expected to remain relatively constant over this period at about 5 percent.

Table A.1-2 Population Growth in Metropolitan's Service Area (July)

(Acre-feet)

County	Actual				Estimated	Projected				
	2000	2005	2010	2015	2020	2025	2030	2035	2040	2045
Los Angeles County	8,833,000	9,025,000	9,010,000	9,277,000	9,275,000	9,692,000	9,894,000	10,118,000	10,332,000	10,538,000
Orange County	2,854,000	2,954,000	3,012,000	3,148,000	3,184,000	3,353,000	3,433,000	3,491,000	3,524,000	3,527,000
Riverside County	1,120,000	1,409,000	1,620,000	1,719,000	1,813,000	1,987,000	2,105,000	2,191,000	2,271,000	2,344,000
San Bernardino County	706,000	783,000	810,000	843,000	872,000	946,000	987,000	1,031,000	1,075,000	1,119,000
San Diego County	2,730,000	2,863,000	2,989,000	3,169,000	3,261,000	3,442,000	3,536,000	3,624,000	3,709,000	3,789,000

Appendix 2

EXISTING REGIONAL WATER SUPPLIES

Appendix 2
EXISTING REGIONAL WATER SUPPLIES

Water used in Metropolitan's service area comes from both local and imported sources. Local sources include groundwater, surface water, and recycled water. Sources of imported water include the Colorado River, the State Water Project (SWP), and the Owens Valley/Mono Basin. On average over the last 10 years (from 2011 to 2020), local sources met about 49 percent of the water needs, while imported sources supplied the remaining 51 percent.

The City of Los Angeles imports water from the Owens Valley/Mono Basin east of the Sierra Nevada through the Los Angeles Aqueduct (LAA). This water currently meets about 5 percent of the region's water needs based on a ten-year average from 2011 to 2020 but is dedicated for use by the City of Los Angeles. Metropolitan provides imported water supplies to meet the remaining 46 percent of the region's water needs based on the same ten-year period. These imported supplies are received through Metropolitan's Colorado River Aqueduct (CRA) and the SWP's California Aqueduct. Table A.2-1 and Figure A.2-1 show the historical sources of local and imported supplies within Metropolitan's service area.

Table A.2-2 shows the quantities of Metropolitan water used by member agencies during the last ten years (2011 to 2020). Metropolitan's largest water customers are the San Diego County Water Authority (25 percent), City of Los Angeles (16 percent), and Municipal Water District of Orange County (12 percent).

The following sections describe the current supply sources in more detail. The main body of the Urban Water Management Plan contains descriptions of planned future supplies.

Local Water Supplies

Local sources of water available to the region include surface water, groundwater, recycled water, and seawater desalination. Some of the major river systems in Southern California have been developed into systems of dams, flood control channels, and percolation ponds for supplying local water and recharging groundwater basins. For example, the San Gabriel and Santa Ana Rivers capture over 90 percent of the runoff in their watersheds. The Los Angeles River system, however, is not as efficient in capturing runoff. In its upper reaches, which make up 25 percent of the watershed, most runoff is captured with recharge facilities. In its lower reaches, which comprise the remaining 75 percent of the watershed, the river and its tributaries are lined with concrete, so there are no recharge facilities. The Santa Clara River in Ventura County is outside of Metropolitan's service area, but it replenishes groundwater basins used by water agencies within Metropolitan's service area. Other rivers in Metropolitan's service area, such as the Santa Margarita and San Luis Rey, are essentially natural replenishment systems.

1. Not including system losses.
2. Colorado River Aqueduct supplies are gross Havasu diversions less return flows, deliveries to USBR, Mexico, and storage.
3. State Water Project Supplies include Table A, Art. 21, Art. 14(b), Art. 12(d), Art. 12(e), Art. 55, draws from storage & carryover, DWCV & other exchanges, transfers, Drought Water Bank and Dry Year Pool Purchases, Pools A&B, Flood Water, wheeling, Port Hueneme lease, and SBVMWD Purchases.
4. Local Supplies includes local groundwater, surface water, recycled water, groundwater recovery, and seawater desalination used for MI, AG, SW or GW recharge in MWD service area. Include Santa Ana River Baseflow at Prado Dam for groundwater recharge. Based on best available data at the time of publication, subject to updates without notice. Data for 2020 not available and is estimated based on historical data.

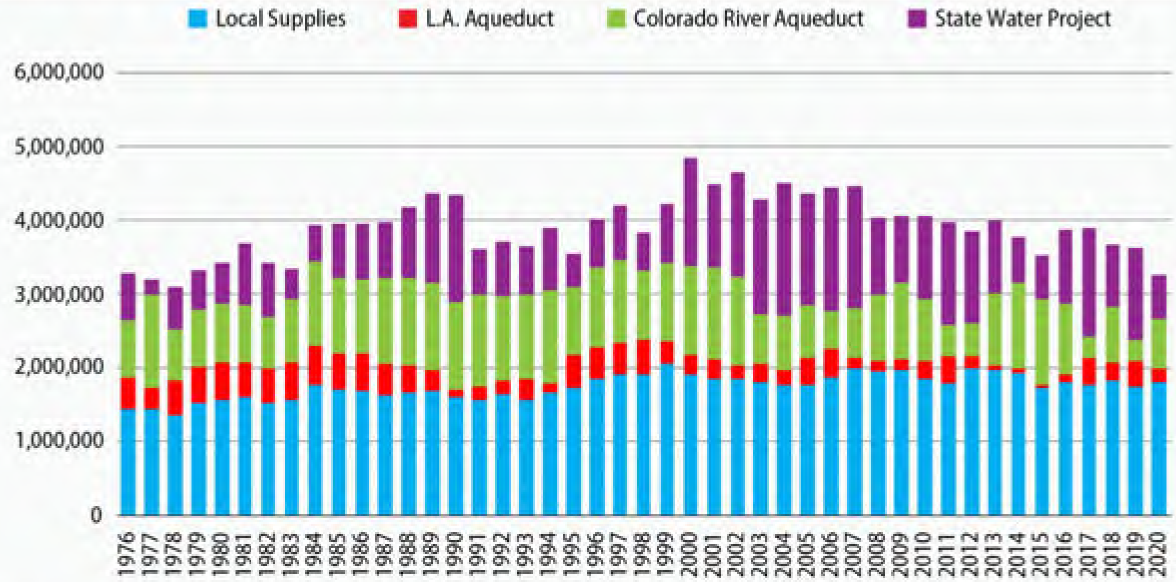
Figure A.2-1 Sources of Supply to Metropolitan's Service Area



Notes:
1. Not including system losses.
2. Colorado River Aqueduct supplies are gross Havasu diversions less return flows, deliveries to USBR, Mexico, and storage.
3. State Water Project Supplies include Table A, Art. 21, Art. 14(b), Art. 12(d), Art. 12(e), Art. 55, draws from storage & carryover, DWCV & other exchanges, transfers, Drought Water Bank and Dry Year Pool Purchases, Pools A&B, Flood Water, wheeling, Port Hueneme lease, and SBVMWD Purchases.
4. Local Supplies includes local groundwater, surface water, recycled water, groundwater recovery, and seawater desalination used for MI, AG, SW or GW recharge in MWD service area. Include Santa Ana River Baseflow at Prado Dam for groundwater recharge. Based on best available data at the time of publication, subject to updates without notice. Data for 2020 not available and is estimated based on historical data.

Local supplies fluctuate in response to variations in rainfall. During prolonged periods of below-normal rainfall, local water supplies decrease. Conversely, prolonged periods of above-normal rainfall increase local supplies. Sources of groundwater basin replenishment include local precipitation, runoff from the coastal ranges, and artificial recharge with imported water supplies. In addition to runoff, recycled water provides an increasingly important source of replenishment water for the region.

Major Groundwater Basins

From 2011-2020, groundwater sources accounted for an average of about 92 percent of the local water supplies, which are found in many basins throughout the Southern California region and provide an annual average total production of about 1.27 MAF per year. Figure A.2-2 shows the locations of the groundwater basins within Metropolitan's service area. Groundwater yield comes from passive recharge from the percolation of rainfall and stream runoff and active recharge from spreading and injection of captured stormwater, recycled water, and imported water. In certain major drainage areas, runoff is retained in flood control reservoirs and released into spreading basins for percolation into the ground. In Los Angeles County, many groundwater recharge facilities located along the upper reaches of the Los Angeles River and San Gabriel River systems provide recharge to San Fernando, Raymond, Main San Gabriel, Central, and West Coast groundwater basins. The Orange County Water District operates a system of diversion structures and recharge basins along the Santa Ana River that captures much of the storm runoff, as well as water from reclamation facilities in Riverside and San Bernardino counties. Storm runoff is also diverted to recharge basins in the Chino Basin. This water, which would otherwise flow into the Pacific Ocean, is allowed to percolate into the underlying aquifers so it may be pumped for local use when needed. Recycled water use for groundwater recharge has increased steadily. The Water Replenishment District of Southern California (WRD) has spread recycled water at the Montebello Forebay to recharge Central and West Coast basins for many years and has expanded this practice with the completion of the WRD Albert Robles Center for Water Recycling and Environmental Learning in 2019. The Inland Empire Utilities Agency (IEUA) provides recycled water for recharge of the Chino Basin. Orange County Water District has implemented the Groundwater Replenishment System (GWRS) to recharge over 100 TAF per year of highly-treated recycled water to the Orange County Basin. Highly treated recycled water is also used at seawater barriers in the West Coast, Central, and Orange County basins and has largely replaced use of imported water for this purpose.

Almost all major groundwater basins in Southern California are either adjudicated or managed by special districts or agencies. Over 95 percent of the groundwater used in Metropolitan's service area is produced from adjudicated or managed groundwater basins. Adjudicated basins in the region include: Raymond Basin, Upper Los Angeles River Area basins (which include San Fernando, Sylmar, Verdugo, and Eagle Rock Basins), Main San Gabriel Basin, Puente Basin, Central Basin, West Coast Basin, Six Basins, Hemet-San Jacinto Basin, Chino Basin, and Cucamonga Basin. The Orange County Groundwater Basin is managed by Orange County Water District; portions of the Ventura County Basins are managed by the Fox Canyon Groundwater Management Agency; and the West San Jacinto Basins are managed by Eastern Municipal Water District. In general, these basins have management plans that include protection from seawater intrusion in the coastal region, water quality deterioration, and excessive lowering of water levels. Groundwater basin managers address treatment of contamination, manage recharge and storage programs, and monitor extraction, water levels, and water quality.

Major River Systems and Reservoirs

Local surface water resources consist of runoff captured in storage reservoirs and diversions from streams. Reservoirs hold the runoff for later direct use, and diversions from streams are delivered directly to local water systems. As Table A.2-3 shows, local water agencies currently own and operate 33 reservoirs. These reservoirs provide a storage capacity of approximately 862 TAF. The historic average yield of these local surface supplies, which come from reservoir releases and stream diversions, is about 87 TAF per year from 2011-2020. The annual yield varies widely between wet and dry years, and most reservoirs that capture local surface runoff are operated with minimal carry-over storage. San Diego County has the greatest storage capacity for these types of reservoirs, with approximately 84 percent of the total local agency storage capacity in Metropolitan's service area.

In addition to the storage that is owned and operated by local agencies, Metropolitan operates DVL, Lake Skinner, and Lake Mathews. DVL stores water imported during years of ample supply. DVL's 810 TAF capacity is used to augment supplies to meet dry year and seasonal needs, and also provides supply for the region during an emergency period. While Lake Skinner and Lake Mathews are largely used for system operations, they may also be used to augment supplies during dry years and emergencies, if necessary and available. Table A.2-4 lists the Metropolitan-owned reservoirs with significant storage capacity.

Table A.2-4
Total Storage Capacity of Metropolitan's Reservoirs
(Thousands Acre-feet)

Reservoir	Capacity
Diamond Valley Lake	810
Lake Skinner[1]	44
Lake Mathews[1]	182

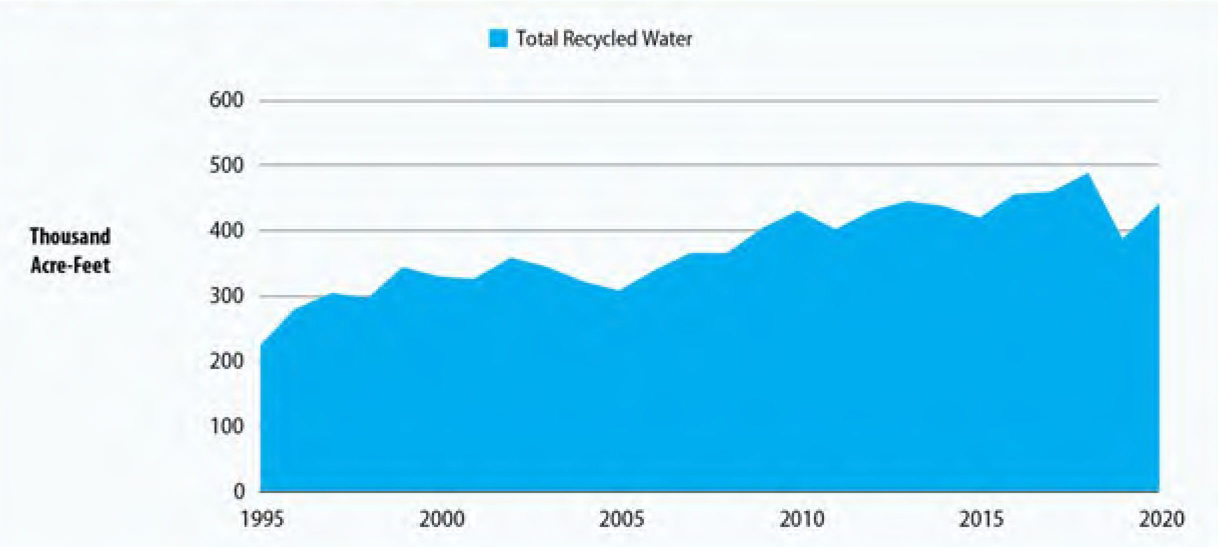
[1] These are used for operations and not primarily for dry year storage.

Lastly, Castaic and Perris are the terminal reservoirs to the West Branch and East Branch of the California Aqueduct operated by DWR. Through the Monterey Amendment to its SWP water service contract, Metropolitan has access to 219 TAF of flexible storage capacity in these SWP terminal reservoirs.

Water Recycling and Groundwater Recovery

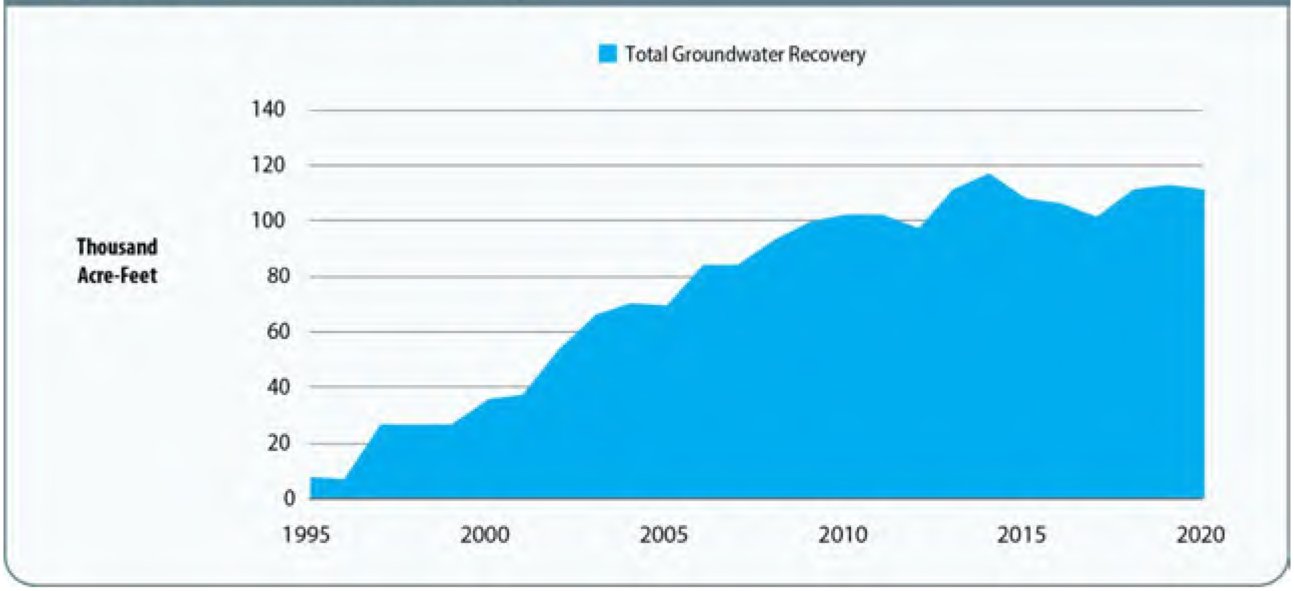
Water recycling projects involve treating wastewater to a level that is acceptable and safe for many non-potable applications. This resource is providing an increasing level of local water. In 1982, Metropolitan began helping to fund its member agencies' recycled water projects. Since that time, Metropolitan has invested approximately $510 million. In fiscal year 2019-20, water recycling projects in which Metropolitan has invested produced over 71 TAF. Local agency projects that did not receive financial assistance from Metropolitan produced an additional 320 TAF, and approximately 50 TAF of Santa Ana River base flow were used to recharge the Orange County basin. This brings the regional total to 441 TAF of recycled water use. Figure A.2-3 demonstrates the increase in this regional supply for direct use.

Figure A.2-3 Recycled Water



In addition, local agencies have implemented several projects to recover contaminated or degraded groundwater for potable uses. The groundwater recovery projects use a variety of treatment technologies to remove nitrates, volatile organic compounds, perchlorate, color, and salt. In 1991, Metropolitan began helping fund its member agencies' groundwater recovery projects. Since that time, Metropolitan has invested approximately $173 million. In FY 2019-20, these groundwater recovery projects produced 50 TAF. Other member agency projects that did not receive funding from Metropolitan produced another 62 TAF, for a regional total of 112 TAF. Figure A.2-4 shows this increase in supply.

Figure A.2-4 Groundwater Recovery



Imported Water

Most member agencies and retail water suppliers depend on imported water for a portion of their water supply. For some member agencies, Metropolitan supplies most of the water used within that agency's service area, while others obtain varying amounts of water from Metropolitan to supplement local supplies. For example, Los Angeles and San Diego (the largest and second largest cities in the state) have historically obtained up to 85 percent of their water from imported sources. These imported water requirements are similar to those of other metropolitan areas within the state, such as San Francisco and other cities around the San Francisco Bay.

Figure A.2-5 shows the conveyance facilities for the state's imported water supplies. Descriptions of each of the imported sources of water available to Metropolitan's service area follow. Justification for projected water supplies from these sources is provided in Appendix 3.

Colorado River

A number of water agencies within California have rights to divert water from the Colorado River. Through the Seven Party Agreement (1931), seven agencies recommended apportionments of California's share of Colorado River water within the state. Table A.2-5 shows the historic apportionment of each agency, and the priority accorded that apportionment.

Table A.2-5
Priorities in Seven Party Agreement and Water Delivery Contracts

Priority	Description	TAF Annually
1	Palo Verde Irrigation District – gross area of 104,500 acres of land in the Palo Verde Valley	
2	Yuma Project (Reservation Division) – not exceeding a gross area of 25,000 acres in California	
3(a)	Imperial Irrigation District and land in Imperial and Coachella Valleys[1] to be served by All American Canal	3,850
3(b)	Palo Verde Irrigation District –16,000 acres of land on the Lower Palo Verde Mesa	
4	Metropolitan Water District of Southern California for use on the coastal plain of Southern California	550
Subtotal		4,400
5(a)	Metropolitan Water District of Southern California for use on the coastal plain of Southern California	550
5(b)	Metropolitan Water District of Southern California for use on the coastal plain of Southern California[2]	112
6(a)	Imperial Irrigation District and land in Imperial and Coachella Valleys[1] to be served by the All American Canal	
6(b)	Palo Verde Irrigation District –16,000 acres of land on the Lower Palo Verde Mesa	300
7	Agricultural Use in the Colorado River Basin in California	
	Total Prioritized Apportionment	**5,362**

[1] The Coachella Valley Water District now serves Coachella Valley.

[2] In 1946, the City of San Diego, the San Diego County Water Authority, Metropolitan, and the Secretary of the Interior entered into a contract that merged and added the City of San Diego's rights to store and deliver Colorado River water to the rights of Metropolitan. The conditions of that agreement have long since been satisfied.

Figure A.2-5
MAJOR WATER CONVEYANCE FACILITIES IN CALIFORNIA

The water is delivered to Metropolitan's service area by way of the CRA, which has a rated capacity of approximately 1,700 cfs. The CRA conveys water 242 miles from its Lake Havasu intake to its terminal reservoir, Lake Mathews, near the City of Riverside. Conveyance losses along the CRA of 10 TAF per year reduce the amount of Colorado River water received in the coastal plain.

Since the date of the original contract, several events have occurred that changed the dependable supply that Metropolitan expects from the Colorado River. The most significant event was the 1964 U.S. Supreme Court decree in *Arizona v. California* that reduced Metropolitan's dependable supply of Colorado River water to 550 TAF per year. The reduction in dependable supply occurred with the commencement of Colorado River water deliveries to the Central Arizona Project. In 1987, Metropolitan entered into a contract with the U.S. Bureau of Reclamation (USBR) for an additional 180 TAF per year of surplus water when surplus water is available. In addition, Metropolitan has obtained a minimum of approximately 85 TAF per year of Colorado River water since 1996 through a conservation program with the Imperial Irrigation District.

In 1979, the Present Perfected Rights (PPRs) of certain Indian reservations, cities, and individuals along the Colorado River were quantified. These PPRs predate the Seven Party Agreement, but the rights holders were not included in the Seven Party Agreement prioritizing California's use and storage of Colorado River water.

In 1999, under the auspices of the Colorado River Board of California, a draft plan, "California's Colorado River Water Use Plan," was developed. The Colorado River Board of California protects California's rights and interests in the resources provided by the Colorado River and represents California in discussions and negotiations regarding the Colorado River and its management. The overall purpose of California's Colorado River Water Use Plan is to provide Colorado River water users with a framework by which programs, projects, and other activities may be coordinated and cooperatively implemented. This framework specified how California would make the transition from relying on surplus water supplies from the Colorado River to living within its normal (basic) water supply apportionment.

To implement these plans, a number of agreements have been executed. In October 2003, representatives from Metropolitan, IID, and Coachella Valley Water District (CVWD) executed the Quantification Settlement Agreement (QSA) and several other related agreements. Parties involved include the San Diego County Water Authority (SDCWA), the California Department of Water Resources (DWR), the California Department of Fish and Wildlife, the U.S. Department of the Interior, and the San Luis Rey Indian Water Rights Settlement Parties. The QSA quantifies the use of water under the third priority of the Seven Party Agreement and allows for implementation of agricultural conservation, land management, and other programs identified in Metropolitan's 1996 IRP. Quantification of the third priority provides the needed numeric baseline from which conservation and transfer programs may be measured. The QSA has helped California reduce its reliance on Colorado River down to its normal apportionment (4,400 TAF).

The quantification of the agricultural priorities under the QSA provided for the water saved under the Palo Verde Land Management and Crop Rotation Program to be made available to Metropolitan. This program provides up to 133 TAF of water to be available to Metropolitan in certain years and will supply a minimum of 33 TAF per year.

SDCWA is participating in QSA-related projects that are providing additional water supplies that the agency exchanges with Metropolitan for receipt of Metropolitan deliveries. First, the water conserved by these projects is made available to Metropolitan. In exchange, Metropolitan is delivering an amount of Metropolitan water equal to the amount of Colorado River water conserved by IID for SDCWA. Second, federal law allocates a portion of the water available as a result of the Coachella Canal Lining Project and the All-American Canal Lining Project for the benefit of parties, including five Indian Bands, and two non-Indian municipal water purveyors (San Luis Rey Settlement Parties) involved in litigation over water rights to the San Luis Rey River in San Diego County. Metropolitan has agreed to exchange that water and provide an equal amount of water to the United States for use by the San Luis Rey Settlement Parties, and SDCWA has agreed to convey the water when capacity is available for use within the Settlement Parties' service areas. The remainder of the water available as a result of the canal lining projects, up to the cap specified in the Metropolitan-SDCWA exchange agreement, is exchanged with SDCWA.

In October 2004, Southern Nevada Water Authority (SNWA) and Metropolitan entered into a storage and interstate release agreement. Under this program, SNWA can request that Metropolitan store unused Nevada apportionment. The amount of water which Metropolitan diverted through 2015 under this agreement was over 422 TAF. In subsequent years, SNWA may request return of approximately 330 TAF. It is expected that SNWA will not request return of stored water until after 2026.

In December 2007, the Secretary of the Interior approved the adoption of specific interim guidelines for reductions in Colorado River water deliveries during declared shortages and coordinated operations of Lake Powell and Lake Mead. These guidelines provide water release criteria from Lake Powell and water storage and water release criteria from Lake Mead during shortage, normal, and surplus conditions in the Lower Basin; provide a mechanism for the storage and delivery of conserved system and non-system water in Lake Mead; and modify and extend interim surplus guidelines through 2026. The Record of Decision and accompanying agreement among the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encourage agencies to develop conservation programs, and allow the states to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from shortages in all but the most extreme hydrologic conditions.

In May 2006, Metropolitan and the USBR executed an agreement for a demonstration program that allowed Metropolitan to leave conserved water in Lake Mead that Metropolitan would otherwise have used in 2006 and 2007. The water left in Lake Mead must have been made available through extraordinary conservation measures, which was accomplished in 2006 and 2007 through savings realized under the Palo Verde Land Management, Crop Rotation, and Water Supply Program. This demonstration program was an activity eligible for creation of Extraordinary Conservation Intentionally Created Surplus (ICS) under the provisions of the December 2007 federal guidelines for the operation of Lake Powell and Lake Mead. Metropolitan continued to store water in Lake Mead through extraordinary conservation measures as provided in the December 2007 federal guidelines in 2009, 2010, 2011, 2012, 2016, 2017, 2018, and 2019. Metropolitan took delivery of a portion of its extraordinary conservation ICS in 2013, 2014, and 2015. As of January 1, 2020, Metropolitan had approximately 866 TAF of extraordinary conservation ICS water in Lake Mead.

The December 2007 federal guidelines provided Colorado River contractors the ability to create System Efficiency ICS through development and funding of system efficiency projects. To that end, in 2008 the Central Arizona Water Conservation District, SNWA, and Metropolitan contributed funds for the construction of the Drop 2 (Brock) Reservoir by the USBR. The purpose of the Drop 2 reservoir is to increase the capacity to regulate deliveries of Colorado River water at Imperial Dam, reducing the amount of water released downstream, and therefore lost from storage in Lake Mead, by approximately 70 TAF annually. In return for funding one-sixth of the project cost, 100 TAF of water stored in Lake Mead was assigned to Metropolitan as System

Efficiency ICS in 2008. Metropolitan also created approximately 24 TAF of System Efficiency ICS by contributing to a one-year pilot operation of the Yuma Desalting Plant. Overall, from 2008-2011, Metropolitan created over 124 TAF of System Efficiency ICS As of January 1, 2020, Metropolitan had approximately 89 TAF of System Efficiency ICS water in Lake Mead.

In November 2012, as part of the implementation of Minute 319 to the 1944 water treaty between the U.S. and Mexico, Metropolitan executed an agreement with the USBR and other Lower Colorado River Basin stakeholders to fund a pilot water conservation program in the Mexicali Valley region of Mexico in exchange for a portion of the conserved water received as Binational ICS (BICS) stored in Lake Mead, converted from Intentionally Created Mexican Allocation (ICMA). The Minute 319 pilot program was completed in 2017, and Metropolitan received 23,750 AF of BICS, which remained stored in Lake Mead as of January 1, 2020. In September 2017, Metropolitan executed a similar agreement as part of the implementation of Minute 323, through which Metropolitan expects to receive up to 27,275 AF of BICS between 2020 and 2026.

In May 2019, in response to ongoing conditions in the Colorado River Basin and concern over water levels in Lake Mead, Metropolitan, the Secretary of the Interior, and representatives of state governments and water agencies throughout the Colorado River Basin executed the *Agreement Concerning Colorado River Drought Contingency Management and Operations* (DCP). Exhibit 1 of Attachment B to the DCP—*Lower Basin Drought Contingency Operations* (LBOps)—specifies certain changes to the management of Lake Mead. Key provisions include increases in the cumulative allowable ICS storage in Lake Mead for each state, greater flexibility in annual ICS storage limits, and the requirement for Lower Basin states to make contributions to Lake Mead storage ("DCP contributions") when water levels drop below elevation 1075 feet. California DCP contributions are required when Lake Mead levels drop below elevation 1045 feet.

Metropolitan is undertaking ongoing efforts to maintain and improve the flexibility and quality of its water supply from the Colorado River. Section 3.1 of this Plan describes current programs and plans related to flexibility, and Section 4 describes water quality programs.

State Water Project

The State Water Project, which is owned by the state and operated by DWR, is the second source of Metropolitan's imported water supplies. The SWP comprises 32 storage facilities (reservoirs and lakes), 662 miles of aqueduct, and 25 power and pumping plants.

The SWP conveys water from Northern California to the north and south of the San Francisco Bay Area and areas south of the Bay Delta region. Water from the SWP originates at Lake Oroville, which is located on the Feather River in Northern California. That water, along with all additional unused water from the watershed, flows into the Sacramento/San Joaquin Delta. Water from the Delta is then either pumped to water users in the San Francisco Bay area or transported through the California Aqueduct to water users in Central and Southern California.

DWR contracted to deliver water in stages to 32 SWP contractors, with an ultimate delivery of 4,172 TAF per year. Three contractors have had their contract amounts taken on by other contractors; currently, DWR is delivering water to 29 SWP contractors. Metropolitan is the largest, with a contractual amount of 1,911 TAF per year, or approximately 46 percent of the total contracted amount. Metropolitan receives deliveries of SWP supplies via the California Aqueduct at Castaic Lake in Los Angeles County, Devil Canyon Afterbay in San Bernardino County, and Box Springs Turnout and Lake Perris in Riverside County. The first delivery of SWP water to Metropolitan occurred in 1972.

The initial facilities of the SWP, completed in the early 1970s, were designed to meet the original needs of the SWP contractors. It was intended that additional SWP facilities would be built over time to meet projected increases in contractors' delivery needs. Each contractor's SWP contract provided for a buildup in contractual amount over time, with most contractors reaching their maximum annual contractual amount by the year 1990. Since the completion of the initial SWP facilities in the early 1970s, major improvements to the system have included: four new pumps added to the Banks Pumping Plant at the Delta, the completion of the Coastal Branch, and the East Branch enlargement. Even with these improvements, however, there are still significant capacity constraints within the SWP that limit the delivery capability of the full contracted amount. During the same time, the contractors' needs for water from the SWP have increased. As a result, the contractors' demands for SWP water currently exceed the dependable yield.[1] Metropolitan has developed groundwater storage programs with Semitropic Water Storage District, Arvin-Edison Water Storage District, Kern Delta Water District, and Antelope Valley-East Kern Water Agency to supplement the available water supply.

The amount of contractual supplies DWR approves for delivery varies annually with contractor demands and projected water supplies from tributary sources to the Delta, based on snowpack in the Sierra Nevada, reservoir storage, operational constraints, and demands of other water users. Deliveries to Metropolitan reached a high of 1,802 TAF in calendar year 2004. Metropolitan experienced shortages in SWP supplies in fiscal years 1991 and 1992, with reduced deliveries of 391 TAF and 710 TAF, respectively.[2] SWP deliveries were limited to a record low 5 percent of contractual amount in 2014 and 20 percent of contractual amount in 2015. For calendar year 2021, the SWP allocation decreased from an initial allocation of 10 percent to 5 percent based on on-going dry conditions. The five percent SWP allocation for Metropolitan in 2014 and 2021 represents the lowest in the history of the SWP.

In recent years, the listing of several fish species in the Sacramento/San Joaquin River Delta (Delta) under both state and federal Endangered Species Acts has constrained SWP operations and created more uncertainty in SWP supply reliability. These listed species include Delta smelt, winter-run Chinook salmon, spring-run Chinook salmon, Central Valley steelhead, green sturgeon, and Longfin smelt (state-listed only). In August 2020, DWR released the SWP Delivery Capability Report. The report shows that current SWP delivery capability has been negatively impacted by two significant factors. The first is the 2018 Addendum to the Coordinated Operation Agreement (COA), which increased State Water Project obligations to meet in-basin uses and decreased the ability of the State Water Project to export water relative to the Central Valley Project. The second major factor is operational changes by DWR to maintain higher levels of storage in Lake Oroville, made in part to ensure sufficient supplies to meet increased COA obligations. Additionally, the report shows a reduction in future delivery capability because of climate change, which is altering the hydrologic conditions in the State.

Metropolitan is undertaking ongoing efforts to maintain and improve the reliability and quality of its water supply from the State Water Project. Sections 3.2 and 3.3 in this Plan describe current programs and plans for reliability, and Chapter 4 addresses water quality issues.

Los Angeles Aqueduct

The City of Los Angeles imports water from the eastern Sierra Nevada through the Los Angeles Aqueduct (LAA). The original LAA, completed in 1913, imported water from the Owens Valley. In 1940, the aqueduct was extended to the Mono Basin. A second aqueduct, which parallels the original, was completed in 1970.

---

[1] The dependable yield of the existing SWP facilities is considered to be the delivery capability during a critically dry seven-year period.

[2] These numbers are Metropolitan's allocated contractual amount. Total water deliveries to Metropolitan's service area are shown in Table A.2-1.

Prior to the 1990-1991 drought, the City of Los Angeles had imported an average of 440 TAF of water annually from the combined Owens Valley/Mono Basin system, of which about 90 TAF came from the Mono Basin. In 1986, the aqueduct delivered a record 520 TAF of water.

In the late 1980s, a series of court injunctions limited the amount of water that Los Angeles could receive from its aqueduct system. In 1990, these limitations, along with a persistent drought, limited the delivery from the aqueduct to only 106 TAF. The Mono Lake Water Rights Decision (Decision) in September of 1994 ended the litigation in the Mono Basin, while negotiations continued with Inyo County on the fate of the Owens Valley water supply. In the Decision, the state ruled that Mono Lake should rise 17 feet over the next 25 years. During this time, Los Angeles would only be permitted to divert a fraction of its historical amounts. After the lake had risen, the City of Los Angeles would still be allowed only significantly reduced diversions. However, the high precipitation during the 1990s allowed increased diversions of water to the LAA to occur at a much earlier time frame than had been foreseen at the time of the Decision.

More recently, the LAA diversions of water from the Owens Valley came under additional pressure. Diversion of water from the Owens River had led to the drying up of Owens Lake by the end of the 1920s. This dry lakebed became a major source of windblown dust, resulting in EPA pressure to develop a State Implementation Plan to bring the region into compliance with federal air quality standards. In 1998, the Los Angeles Department of Water and Power entered into a Memorandum of Agreement with the Great Basin Air Pollution Control District that specified actions needed to control the problem. These actions included shallow flooding and managed vegetation at various lakebed locations. An estimated 54 TAF per year will be required to maintain the dust control measures, further restricting the water available for diversion through the LAA. More recently, the city has been required to restore portions of the Owens River, which could further restrict the water that can be provided from this source. During the last 5 years (2015 to 2019), LAA supplies ranged from a high of 380 TAF in 2017 to a low of 33 TAF in 2015.

Historic Total Regional Water Supplies

The previous sections have presented the various sources of Metropolitan and the region's water supply. The amount of water supplied by each local and imported source from 1976 through 2020 appears in Table A.2-1. The imported supplies represent the amount of water imported into Metropolitan's service area, not the amount delivered to member agencies, which is shown in Table A.2-2. The difference between Metropolitan's imports and deliveries is water placed into or withdrawn from storage.

Appendix 3

JUSTIFICATIONS FOR SUPPLY PROJECTIONS

Appendix 3
JUSTIFICATIONS FOR SUPPLY PROJECTIONS

The California Water Code (CWC) Section 10631 requires that urban water suppliers identify and quantify, to the extent practicable, the existing and planned sources of water available to them over five-year increments to 20 years or as far as data is available. This CWC section further requires urban suppliers to include a detailed description of all water supply projects and water supply programs that may be undertaken to meet the total projected water use. This Appendix provides the basis for the water supply available to Metropolitan as contained in this plan, by each major source of supply. Such bases and proofs are required for supply verification under the legislation.

Throughout this Appendix, references are made to Metropolitan's operating budget and its long-term capital investment plan. The most recent operating budget (for fiscal years 2020-21 and 2021-22) was adopted at the April 14, 2020 meeting of Metropolitan's Board of Directors. A copy of the budget summary and the Capital Investment Plan for fiscal years 2020-21 and 2021-22 can be found at:
http://mwdh2o.com/PDF_Who_We_Are/Biennial%20Budget%20–%20Fiscal%20Years%202020-21%20and%202021-22.pdf.

Another document of interest related to Metropolitan's water supply planning is its annual report to the state Legislature in compliance with Senate Bill 60 of 1999 (Hayden).[1] Senate Bill 60 requires that Metropolitan report on its progress in increasing its emphasis on cost-effective conservation, recycling, and groundwater recharge.

A.3.1. Colorado River Aqueduct Deliveries

A. Colorado River Supplies

Metropolitan obtains water from the Colorado River under its Boulder Canyon Project Section 5 water delivery contract with the Secretary of the Interior providing for permanent service. A number of programs have been developed over the years to enhance and manage Colorado River supplies available under its water delivery contract. Appendix 2 describes the history of water supplies and the expected availability from this source, and Section 3.1 of the 2020 UWMP describes the agreements for water supplies.

Rationale for the Expected Supply

Historical Record

Water supply under Metropolitan's Boulder Canyon Project Section 5 water delivery contract has been delivered since 1939. By existing contract, it is expected to be available in perpetuity because of California's senior water rights to use of Colorado River water.

[1] Metropolitan Water District of Southern California, *Annual Progress Report to the California State Legislature: Achievements in Conservation, Recycling and Groundwater Recharge (February 2021)*, which can be found at http://www.mwdh2o.com/PDF_About_Your_Water/Annual_Achievement_Report.pdf. The legislation requiring this information can be found at http://www.leginfo.ca.gov/pub/99-00/bill/sen/sb_0051-0100/sb_60_bill_19990916_chaptered.pdf. Similar reports have been filed with the Legislature since 2000.

The historical record for available Colorado River water indicates that Metropolitan's contracted Colorado River supply has been available in every year and can reasonably be expected to be available over the next 20 years. Through 2002 the volume of water available and diverted from the Colorado River has been up to the annual capacity of the Colorado River Aqueduct of approximately 1.25 MAF. Since 2003, increased use by the other Colorado River basin states and persistent dry conditions in the Colorado River Basin has reduced the firm available supply to its 550 TAF Priority 4 entitlement.

Written Contracts or Other Proof

Metropolitan's entitlement to Colorado River water is based on a series of interstate compacts, federal laws, agreements, court decrees, and guidelines collectively known as "The Law of the River,"[2] which govern the distribution and management of Colorado River water. The following documents specifically determine Metropolitan's dependable supplies:

1931 Seven Party Agreement.[3] The 1931 Agreement recommended California's Colorado River use priorities and has no termination date. The priorities to water available for use in California held by Palo Verde Irrigation District (PVID), Yuma Project (Reservation Division), Imperial Irrigation District (IID), Coachella Valley Water District (CVWD), and Metropolitan are shown in Table A.2-5. These priorities are incorporated into the water delivery contracts that the Secretary of the Interior executed with the California agencies in the 1930s for water from Lake Mead. Metropolitan holds Priority 4 to California's basic apportionment of Colorado River water and utilizes this water – 550 TAF per year. Metropolitan also holds Priority 5 to 662 TAF per year. Appendix 2 describes the current status of water available under these priorities.

Metropolitan's Basic Contracts.[4] Metropolitan's 1930, 1931, and 1946 basic contracts with the Secretary of the Interior permit the delivery of 1.212 MAF per year when sufficient water is available. Metropolitan's 1987 surplus flow contract for up to 180 TAF with USBR permits the delivery of water to fill the remainder of the Colorado River Aqueduct when water is available.

Consolidated Court Decree.[5] The 1964 U.S. Supreme Court Decree confirmed the Arizona, California, and Nevada basic apportionments of 2.8 MAF per year, 4.4 MAF per year, and 300 TAF per year, respectively. The 1964 Decree also permits the Secretary of the Interior to make water available that is unused by one of the states for use in the other two states. In addition, it permits the Secretary of the Interior to make surplus water available. The Consolidated Decree issued on March 27, 2006, by the U.S. Supreme Court in Arizona v. California consolidated into one decree the initial 1964 decree, the 1979 supplemental decree, the 1984 second supplemental decree, the 2000 third supplemental decree, and the 2006 approval of settlements reached on the water rights claim of the Fort Yuma Indian Reservation. The Consolidated Decree quantified present perfected rights (PPRs) to the use of Colorado River water by certain Indian reservations, federal wildlife refuges, and other users.

2003 Quantification Settlement Agreement (QSA). The QSA and several other related agreements were executed in October 2003.[6] The QSA quantifies the use of water under the third priority of the Seven Party Agreement, and further allocates 38 TAF of the sixth priority to

---

[2] A description of many of these documents can be found at http://www.usbr.gov/lc/region/pao/lawofrvr.html.

[3] This agreement among the seven California agencies was dated August 18, 1931, and was codified in federal regulations promulgated by the Secretary of the Interior on September 28, 1931.

[4] Including contract number Ilr-645 dated April 9, 1930, supplemented September 28, 1931.

[5] The Consolidated Decree entered by the U.S. Supreme Court on March 27, 2006, in *Arizona v. California, et al.*, can be found at http://www.usbr.gov/lc/region/pao/pdfiles/scconsolidateddecree2006.pdf.

[6] These agreements can be found at http://www.iid.com/water/library/qsa-water-transfer.

Metropolitan. The QSA provides the numeric baseline needed to measure conservation and transfer programs, and it allows for implementation of agricultural conservation, land fallowing, and other programs identified in Metropolitan's IRP. Although this agreement does not directly impact Metropolitan's entitlements, Metropolitan agreed to forbear consumptive use when necessary so that the Secretary of the Interior can satisfy the uses of holders of miscellaneous and Indian present perfected rights in excess of 14.5 TAF.

<u>2005 Settlement Agreement with Quechan Indian Tribe.</u> In 2005, Metropolitan entered into a settlement agreement in Arizona v. California with the Quechan Indian Tribe and other parties. The Tribe uses Colorado River water on the Fort Yuma Indian Reservation. Under the settlement agreement, the Tribe, in addition to the amounts of water decreed for the benefit of the Reservation in the 1964 decree in Arizona v. California, is entitled to (a) 20 TAF of diversions from the Colorado River, or (b) the amount necessary to supply the consumptive use required for irrigation of a specified number of acres, and for the satisfaction of related uses, whichever is less. Of the additional diversions, 13 TAF became available to the Tribe in 2006. An additional 7 TAF becomes available to the Tribe in 2035. Metropolitan agreed to provide annual incentive payments to the Tribe if the Tribe forbore diversion of the additional water, thereby allowing Metropolitan to divert it.

<u>Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations for Lake Powell and Lake Mead.</u> In December 2007, the Secretary of the Interior approved a Record of Decision establishing specific interim guidelines for reductions in Colorado River water deliveries in the Lower Basin during declared shortages and coordinated operations of Lake Powell and Lake Mead. These guidelines provide water release criteria from Lake Powell and water storage and water release criteria from Lake Mead during shortage, normal, and surplus conditions in the Lower Basin, and provide a mechanism for Metropolitan to store and take delivery of conserved system and non-system water in Lake Mead. In December 2020, the seven Colorado River Basin States sent a letter to the Secretary of Interior giving notice that the Basin States have begun the process of reconsultation regarding the 2007 interim guidelines. The Basin States and major water contractors, including Metropolitan, will be involved in reconsultation and development of new guidelines for the management and operation of Lake Powell and Lake Mead after the term of the 2007 interim guidelines ends in 2026.

<u>Lower Basin Drought Contingency Plan.</u> In April 2019, the President signed legislation directing the Secretary of the Interior to sign and implement four DCP agreements related to the Upper and Lower Basin DCPs without delay. The agreements were executed and became effective on May 20, 2019 and will continue to be effective through 2026. The Lower Basin Drought Contingency Plan Agreement requires California, Arizona and Nevada to contribute defined volumes of water to Lake Mead ("DCP Contributions") when lake elevations drop below certain levels. California would begin making these contributions if USBR modeling projects Lake Mead's elevation to be at or below 1,045 feet (relative to mean sea level) on January 1. Lake Mead elevation in January 2020 was 1,090 feet. Depending on the lake's elevation, California's annual contributions would range from 200 to 350 TAF. Pursuant to intrastate implementation agreements that terminate in 2026, Metropolitan is responsible for 93 percent of any California DCP Contribution that may be required under the Lower Basin DCP. CVWD is responsible for 7 percent of California's required DCP Contributions.

Implementation of the Lower Basin DCP enhances Metropolitan's ability to store water in Lake Mead and to ensure that water in storage can be delivered at a later date. The Lower Basin DCP increases the total volume of water that California may store in Lake Mead as ICS by 200 TAF. Water stored as ICS will be available for delivery as long as Lake Mead's elevation remains above 1,025 feet. Previously, that water would likely have become inaccessible below a Lake Mead elevation of 1,075 feet. DCP Contributions may be made through conversion of existing ICS. These types of DCP Contributions become DCP ICS. DCP Contributions may also be made by leaving water in Lake Mead to which there was a legal right of delivery. This type of DCP Contribution becomes system water and may not be recovered. Rules are set for delivery of DCP ICS through 2026 and between 2027 to 2057.

Financing

Metropolitan's operating budget (referenced at the beginning of this appendix) includes the cost of delivering Colorado River water and the payment to the Quechan Indian Tribe, which is paid from water sales revenue.

Federal, State, and Local Permits/Approvals

Metropolitan's fourth priority Colorado River water is currently available, and this priority assures delivery of the basic apportionment.

B. IID - Metropolitan Conservation Program

Source of Supply

The IID-Metropolitan Conservation Program provides an annual supply that is delivered to Metropolitan's service area via its Colorado River Aqueduct (CRA). In 1988, Metropolitan executed a Conservation Agreement to fund water efficiency improvements within IID's service area in return for the right to divert the water conserved by those improvements. The program consists of structural and non-structural measures, including the concrete lining of existing canals, the construction of local reservoirs and spill-interceptor canals, installation of non-leak gates, and automation of the distribution system. Other implemented projects include the delivery of water to farmers on a 12-hour basis rather than a 24-hour basis and improvements in on-farm water management.

Expected Supply Capability

The IID-Metropolitan Conservation Program activity began in 1990, has been fully operational since 1998, and makes available 105 TAF of conserved water annually from 2016 onward. The initial program agreement provided CVWD the option to call up to about 45 TAF per year if needed to meet its demands. Execution of the QSA reduced CVWD's option to a maximum of 20 TAF. This water is available to Metropolitan if not required by CVWD, but the minimum supply to Metropolitan has been increased to 85 TAF from 2016 onward through a second amendment to the agreement, and the clarification on the number of 12-hour deliveries that would be included in the program through a letter agreement. This amount was further increased to 90 TAF from 2020-2026 under the 2019 Second Amendment to the Delivery and Exchange Agreement with CVWD, with the remainder of CVWD's option (15 TAF) available for Metropolitan's delivery to CVWD at Whitewater.

Rationale for the Expected Supply

<u>Historical Record</u>

The IID-Metropolitan Conservation Program has been fully operational since 1998. Existing agreements have extended the initial term to at least 2041 or 270 days after the termination of the QSA, whichever is later, and they guarantee Metropolitan a minimum of 85 TAF per year from 2016 onward. A 2019 amendment increases the minimum to 90 TAF from 2020 to 2026.

With operations beginning in 1990, the program has conserved as much as 109.46 TAF per year to date. By an amendment to the program agreement beginning in 2007 and a 2014 letter agreement, the annual conserved water yield will be 105 TAF. The historical record indicates that

Metropolitan's expected minimum supply of 85 TAF per year (and 90 TAF from 2020 to 2026) would be available over at least the next 26 years.

Written Contracts or Other Proof

Metropolitan's annual supply from the IID-Metropolitan Conservation Program is based on three agreements and amendments to those agreements.

1988 IID-Metropolitan Conservation and Use of Conserved Water Agreement. This Agreement was executed in December 1988 by IID and Metropolitan for a 35-year term following completion of program implementation (1998–2033).

1989 Approval Agreement. This Agreement secured the approval of PVID and CVWD to not divert an amount of water equal to the amount conserved except under limited circumstances. The Agreement was executed in December 1989.

1989 Supplemental Approval Agreement. This Agreement was executed in December 1989 between Metropolitan and CVWD to coordinate Colorado River diversions and the use of the conserved water provided by the Program.

2003 Amendments to 1988 Agreement and 1989 Approval Agreement. These amendments revise Metropolitan's potential obligation to reduce its use of the conserved water yield in favor of its use by CVWD down to 20 TAF annually. Any of this water not used by CVWD would be available to Metropolitan. The amendments also extended the term of the IID-Metropolitan conservation program through December 31, 2041, or 270 days beyond the termination of the QSA.

2007 Amendments to 1988 Agreement and 1989 Approval Agreement. These amendments specify that beginning in 2007, the annual conserved water yield has and will be 105 TAF with continued operation of 24 tailwater pump back systems, of which up to 20 TAF would be made available to CVWD upon its request.

2014 Letter Agreement Related to the 1988 Agreement. This letter agreement specifies that beginning in 2016, the annual conserved water yield has and will be 105 TAF, of which up to 20 TAF would be made available to CVWD upon its request. This amendment also removes tailwater recovery systems from the conservation actions and quantifies the yield and number of 12-hour deliveries that are included in the program.

2019 Second Amendment to Delivery and Exchange Agreement Between Metropolitan and Coachella for 35 TAF. The second amendment was executed in December 2019 between Metropolitan and CVWD for the exchange of additional water during the period from 2020 through 2026. Metropolitan will be guaranteed 90 TAF per year from 2020 to 2026, with the remaining amount that CVWD could call (15 TAF) available for Metropolitan's delivery to CVWD at whitewater.

Financing

Construction of the water efficiency improvements under this Program have been funded and put into operation. Metropolitan's five-year financial forecast in the budget includes the cost of operating, maintaining, and delivering the conserved water under the IID--Metropolitan Conservation Program.

Federal, State, and Local Permits/Approvals

A comprehensive environmental review process supported implementation.

EIR for Program. The IID Board certified the final EIR for the Program in December 1986.[7]

Supplemental EIR for Program. The IID Board certified the final EIR for the Completion Program in June 1994.[8]

Program EIR for Quantification Settlement Agreement. Metropolitan's Board certified the final Program EIR for the QSA in June 2002.[9]

Addendums to the QSA Final Program EIR. Metropolitan's Board adopted the Addendum to the QSA Final Program EIR in December 2002 and a second addendum in September 2003. Metropolitan's Board also adopted the Findings of Fact and Statement of Overriding Considerations, and Mitigation and Monitoring and Reporting Program at that time.

C. Palo Verde Irrigation District Land Management, Crop Rotation and Water Supply Program

Source of Supply

At its May 11, 2004 meeting, Metropolitan's Board authorized a 35-year land management, crop rotation, and water supply program with the PVID. Under the program, participating landowners in PVID are being paid to reduce their water use by not irrigating a portion of their land. A maximum of 29 percent of lands within PVID can be fallowed in any given year. Under the terms of the QSA, water savings within the PVID service area are made available to Metropolitan. PVID has the first priority for Colorado River water under the water delivery contracts with the USBR. Implementation of the program began in January 2005. The agreement also specifies that the participating landowners will fallow land in an amount equal to 25% of the landowner's total maximum fallowing commitment during each year.

Expected Supply Capability

It is estimated that the PVID/Metropolitan Program would provide up to 133 TAF per year of additional Colorado River water. This water would be available in any year as needed and in accordance with the provisions described in the agreements with Palo Verde Valley landowners and PVID.

Rationale for the Expected Supply

Historical Record
Metropolitan and PVID tested the concept of developing a water supply for Metropolitan by entering into an agreement in 1992.[10] Agreements were signed with landowners and lessees in the Palo Verde Valley to forego irrigation for a two-year period from August 1992 to July 1994. Water unused by PVID, in the amount of 186 TAF, was stored in Lake Mead for Metropolitan. Both PVID and Metropolitan signed approved Principles of Agreement in 2001. PVID issued the Final

[9] Coachella Valley Water District, Imperial Irrigation District, Metropolitan, San Diego County Water Authority, *Final Program EIR, Implementation of the Colorado River Quantification Settlement Agreement*, June 2002, SCH Number 2000061034.
[10] Presented to Metropolitan's Board at its regular meeting on January 14, 1992.

EIR for the Proposed Palo Verde Irrigation District Land Management, Crop Rotation and Water Supply Program in September 2002.[11]

Implementation of the program began in January 2005. In March 2009, Metropolitan and PVID entered into a one-year supplemental fallowing program within PVID that provided for the fallowing of additional acreage, with savings of 24.1 TAF in 2009 and 32.3 TAF in 2010.

Calendar Year	**Volume of Water Saved** (TAF)
2005	108.7
2006	105.0
2007	72.3
2008	94.3
2009	120.2
2010	116.3
2011	122.2
2012	73.7
2013	32.8
2014	43.0
2015	94.5
2016	125.4
2017	119.4
2018	95.7
2019	44.5
2020	50.0 (estimated)

Written Contracts or Other Proof

Contracts for this program are listed below.

August 2004 Forbearance and Fallowing Program Agreement. This agreement establishes the PVID/Metropolitan Program, which provides for a solicitation of and provisional approval of landowner participation offers, specifies the process for incorporating offers into agreements with landowners, and states the terms and conditions for fallowing, including payments made by Metropolitan.

Landowner Agreements for Fallowing in PVID. These agreements specify an escrow process to consummate the transaction, an easement deed to encumber land for fallowing, a tenant agreement to subordinate a tenant's lease to the agreement and easement, and an encumbrance agreement to subordinate any encumbrance (e.g., a mortgage) to the easement. These agreements also state the landowner's fallowing obligation, payments to be made by Metropolitan, and land management measures to be implemented.

[11] SCH Number 2001101149.

Financing

Metropolitan's annual O&M budget (referenced above) includes the cost of the PVID/Metropolitan Program.

Federal, State and Local Permits

EIR for Program. A Notice of Preparation for the PVID/Metropolitan Program was published on October 29, 2001. PVID issued the Final EIR for the Proposed Palo Verde Irrigation District Land Management, Crop Rotation, and Water Supply Program in September 2002 (see reference above).

D. Land Management of Metropolitan Owned Lands in Palo Verde Valley

Source of Supply

In 2017 and 2018, Metropolitan executed new farm leases on 20,478 irrigable acres that it owns in the Palo Verde valley. These leases provide economic incentives for farmers leasing the land to grow less water-intensive crops, generating additional water savings beyond what is achieved by the Land Management, Crop Rotation, and Water Supply Program. The leases also allow Metropolitan and its lessees to collaborate on other types of conservation, such as high-efficiency irrigation and precision irrigation practices. Under the terms of the QSA, water savings within the PVID service area are made available to Metropolitan.

Expected Supply Capability

Metropolitan's lands in PVID generate water savings through the existing PVID Land Management, Crop Rotation and Water Supply Program. Changes in land management through cropping and irrigation practices generate an additional 14 - 25 TAF annually, compared to a baseline of 2015-16 water use. Because all Metropolitan-owned lands are enrolled in the fallowing program, the savings from agricultural practices depend on the fallowing call for each year, with a high call resulting in lower savings due to lower baseline usage.

Rationale for the Expected Supply

Field water use in PVID is currently measured as applied water rather than consumptive use. The baseline applied water use on Metropolitan's lands was 10.6 AF per acre in 2015-16. In 2017, 2018, and 2019, the applied water use was 8.0 to 8.5 AF per acre, representing a 20% to 25% decrease below baseline. If the consumptive water use is assumed to be half of the applied water use, then the consumptive savings on Metropolitan lands are 1.1 – 1.3 AF per acre.

Metropolitan leases 20,478 irrigable acres in the valley, but depending on the fallowing call, only 13,152 to 19,001 acres are in production in any given year. A 1.1 – 1.3 AF per acre decrease results in 14 to 25 TAF of additional supply per year, depending on the call.

Financing

Metropolitan's annual O&M budget includes the cost of the PVID land management program.

Federal, State and Local Permits

This program is not subject to any permits or environmental impact reviews under federal, state, or local laws.

E. Metropolitan-CVWD Delivery and Exchange Agreement for 35,000 Acre-Feet

Source of Supply

Metropolitan delivers to CVWD up to 35 TAF from Metropolitan's available State Water Project (SWP) Table A supply without condition on the actual Department of Water Resources (DWR) allocation for that year. As CVWD does not have a connection to the SWP, the water is delivered to CVWD by an exchange with Colorado River water. Metropolitan takes delivery of the Table A supply in conjunction with forgoing diversion of an equal volume of its Colorado River supply, effectively leaving this water in the River for diversion by CVWD at Imperial Dam. Exchange deliveries may also be made at the CRA Whitewater service connection or through the Metropolitan-CVWD-Desert Water Agency Advance Delivery Agreement. This program represents a net debit to Metropolitan's supplies.

A second source of supply governs an additional 15 TAF a year obligation from 2020-2026 under the 2019 Second Amendment to the Delivery and Exchange Agreement. However, the source of the increase is water CVWD can call from the IID/MWD Conservation Program, which is Colorado River water. Therefore, this portion of the exchange is described in greater detail in the IID/MWD Conservation Program section. This water is a one-for-one exchange and does not represent a net change to Metropolitan's supplies.

Expected Capability

Up to 35 TAF of Metropolitan's SWP Table A supply will be delivered annually to CVWD by exchange.

Rationale for the Expected Supply

This program is undertaken pursuant to the Delivery and Exchange Agreement between Metropolitan and Coachella for 35 TAF dated October 10, 2003 and is a QSA-related agreement.

Program Facilities

Metropolitan takes delivery of the Table A supply from the East Branch of the California Aqueduct at Devil Canyon Afterbay. At Metropolitan's request, the USBR releases a portion of Metropolitan's available Colorado River supply from Lake Mead for diversion by CVWD at Imperial Dam and conveyance through the All-American Canal System.

Historical Record

Since the 2003 execution of the QSA and the Delivery and Exchange Agreement, the following volumes of exchange water were delivered to CVWD at Imperial Dam:

Calendar Year	Volume of Exchange Water (AF)
2003	0
2004	0
2005	0
2006	34,958
2007	0
2008	0
2009	0
2010	10,000
2011	0

Calendar Year	Volume of Exchange Water (AF)
2012	0
2013	0
2014	0
2015	313
2016	0
2017	0
2018	0
2019	0
2020	0

Written Contracts or Other Proof

2003 Delivery and Exchange Agreement. This agreement between Metropolitan and CVWD provides for the delivery of up to 35 TAF of Metropolitan SWP Table A supply by exchange with Colorado River water.

2019 Second Amendment to Delivery and Exchange Agreement Between Metropolitan and Coachella. The second amendment was executed in December 2019 between Metropolitan and CVWD for the exchange of additional water during the period from 2020 through 2026. Metropolitan will exchange an average of 15 TAF per year with CVWD between 2020 and 2026. The source of this water is the portion of the IID/MWD Conservation Program that is subject to call by CVWD.

Federal, State, and Local Permits/Approvals

Program EIR for Quantification Settlement Agreement. Metropolitan's Board certified the final Program EIR for the QSA in June 2002.[12]

Addendums to the QSA Final Program EIR. Metropolitan's Board adopted the Addendum to the QSA Final Program EIR in December 2002 and a second addendum in September 2003. Metropolitan's Board also adopted the Findings of Fact and Statement of Overriding Considerations, and Mitigation and Monitoring and Reporting Program at that time.

September 2002 Final Program EIR for Coachella Valley Water Management Plan and State Water Project Entitlement Transfer. The final Program EIR for the Coachella Valley Water Management Plan and SWP Entitlement Transfer was certified by the CVWD on October 8, 2002.

F. SNWA and Metropolitan Storage and Interstate Release Agreement

Source of Supply

The source of supply is SNWA's unused Nevada apportionment of Colorado River water made available to Metropolitan for diversion and storage. In later years, Metropolitan would return water through reduced diversions of Colorado River water made at the request of SNWA.

[12] Coachella Valley Water District, Imperial Irrigation District, Metropolitan, San Diego County Water Authority, Final Program EIR, Implementation of the Colorado River Quantification Settlement Agreement, June 2002, SCH Number 2000061034.

Expected Supply Capability

As of January 1, 2020, over 422 TAF had been diverted by Metropolitan since 2004. Of the amount that has been stored, 330 TAF is available for return to SNWA.

Returns to SNWA are limited to no more than 30 TAF annually unless Metropolitan agrees to a larger amount. In 2020 and 2021, SNWA may request return of an amount equal to the shortage allocated by the Secretary of the Interior to Nevada, though they are not expected to do so. If the Secretary of the Interior apportions less than 280 TAF of basic apportionment for use in Nevada, SNWA may request the return of up to 50 TAF, 1 acre-foot for each acre-foot less than Nevada's 280 TAF basic apportionment.

If less than 75 TAF has been returned, then during each year prior to 2027 for which Lake Mead begins the year at or below elevation 1,045 feet, Metropolitan will create 50 TAF of Intentionally Created Surplus (ICS) in Lake Mead, until the combined sum of ICS and the amount of water returned to SNWA equals 75 TAF. Prior to 2027, Metropolitan would be able to request delivery of this ICS during a year in which Lake Mead begins the year at or above elevation 1,080 feet.

Rationale for the Expected Supply

Program Facilities

Water is diverted through the CRA by Metropolitan. To return the water to SNWA, Metropolitan would reduce its CRA diversions, and the Secretary of the Interior would make water available to SNWA at Lake Mead.

Historical Record

The annual volumes of water diverted into the CRA, and the volume of water stored for SNWA by Metropolitan are as follows:

Calendar Year	Volume of Water Diverted (AF)	Volume of Water Stored for SNWA (AF)
2004	10,000	10,000
2005	10,000	10,000
2006	5,000	5,000
2007	0	0
2008	45,000	45,000
2009	0	0
2010	0	0
2011	0	0
2012	62,839	41,892
2013	75,000	50,000
2014	65,000	43,333
2015	150,000	125,000
2016	0	0
2017	0	0
2018	0	0
2019	0	0
2020	0	0

No water has been returned to SNWA.

Written Contracts or Other Proof

2004 Storage and Interstate Release Agreement. This agreement among Metropolitan, the Colorado River Commission of Nevada, SNWA, and the United States provides for the Secretary of the Interior to make available to Metropolitan for diversion and storage unused Nevada apportionment. In subsequent years, the agreement provides for Metropolitan to make water available to SNWA by forgoing diversion of a portion of its available Colorado River supply.

Operational Agreement. As amended on August 11, 2009, on October 24, 2012, and on October 19, 2015, the Operational Agreement specifies the conditions under which Metropolitan would divert and store unused Nevada apportionment through 2026 and the return of water to SNWA.

G. Lower Colorado Water Supply Project

Source of Supply

Groundwater is pumped by the Lower Colorado Water Supply Project wells near the All-American Canal and is discharged to the Canal. IID reduces its net diversions of Colorado River water by an amount equal to the amount of Project water discharged into the Canal, permitting entities along the Colorado River that do not have rights or have insufficient rights to divert Colorado River water to obtain a supply of water. In 2007, Metropolitan entered into a contract with the USBR and the City of Needles to utilize the unused Project capacity.

Expected Capability

Metropolitan estimates that it received 8.8 TAF of Lower Colorado Water Supply Project water in 2020.

Rationale for the Expected Supply

Program Facilities

Two Lower Colorado Water Supply Project wells pump water into the All-American Canal. The groundwater level in one of the wells declined to the point that it could not operate at capacity with existing equipment. Replacement equipment to restore pumping capacity was installed. Two new Project wells became operational in 2016 and brought the pumping capacity to the full 10,000 AFY project capacity.

Historical Record

Metropolitan has received the following amounts of Lower Colorado Water Supply Project water:

Calendar Year	Volume of Water (AF)
2007	5,011
2008	6,300
2009	2,349
2010	3,872
2011	3,611
2012	3,253
2013	4,208
2014	6,109
2015	6,722
2016	6,647
2017	6,851

Calendar Year	Volume of Water (AF)
2018	9,469
2019	9,554
2020	8,800 (estimated)

Written Contracts or Other Proof

2007 Lower Colorado Water Supply Project Contract among the United States, the City of Needles, and Metropolitan. This contract, as amended in 2010 and 2020, provides for the United States to deliver Colorado River water to Metropolitan, the availability of which results from the pumping of Lower Colorado Water Supply Project groundwater and the exchange of such water.

Financing

Metropolitan's O&M budget includes the cost associated with receipt of Lower Colorado Water Supply Project water.

H. Lake Mead Storage Program, Drop 2 (Brock) Reservoir Funding, Yuma Desalting Plant Pilot Project, Binational Intentionally Created Surplus, and the Lower Basin Drought Contingency Plan

Source of Supply

Water has been and will be stored in Lake Mead as Intentionally Created Surplus (ICS) through extraordinary conservation measures, such as water saved through the Palo Verde Irrigation District Land Management, Crop Rotation, and Water Supply Program.

Water has been and will be stored in Lake Mead as ICS through system efficiency measures, such as Metropolitan's funding contributions toward construction of the Drop 2 (Brock) Reservoir near the All-American Canal and pilot operation of the Yuma Desalting Plant.

Water will be stored in Lake Mead as Binational ICS through implementation of pilot conservation projects in Mexico.

Water has been stored in Metropolitan's service area for IID as excess conservation.

Expected Capability

Metropolitan may create as much as 400 TAF of Extraordinary Conservation ICS water in a single year less the amount that may be created by IID, which could be as much as 25 TAF. In any given year, if Arizona and Nevada create less than their respective maximums, according to provisions in the Lower Basin Drought Contingency Plan (DCP) Metropolitan may create above 400 TAF, provided that all entities in the Lower Basin create no more than 625 TAF combined.

As stipulated in the DCP, upon creation, 10 percent of the Extraordinary Conservation ICS is deducted, resulting in additional system water stored in Lake Mead and leaving 90 percent of the water available for release to Metropolitan, without additional annual evaporation losses.

Under the DCP, the amount of Extraordinary Conservation ICS accumulated in Lake Mead for Metropolitan is limited to 1.7 MAF less the amount accumulated by IID which could be as much as 50 TAF and less the amount of Binational ICS stored by both IID and Metropolitan. Per the DCP, Arizona is also allowed to request 50 TAF of California Extraordinary Conservation ICS accumulation space. It is expected that Arizona will do so by the end of 2021.

Metropolitan may take delivery of as much as 400 TAF of Extraordinary Conservation ICS from Lake Mead in a year less the amount delivered to IID, which could be as much as 50 TAF, as long as Lake Mead's elevation remains above 1,025 feet.

Under the DCP, Metropolitan must also store defined volumes of water in Lake Mead at specified lake levels. California would begin making contributions if Lake Mead's elevation is projected to be at or below 1,045 feet (relative to mean sea level) on January 1. Depending on the lake's elevation, California's contributions would range from 200 to 350 TAF a year ("DCP Contributions"). Pursuant to intrastate implementation agreements that terminate in 2026, Metropolitan is responsible for 93 percent of any California DCP Contribution that may be required under the Lower Basin DCP. CVWD is responsible for 7 percent of California's required DCP Contributions.

As of January 1, 2020, Metropolitan has 89 TAF of System Efficiency ICS stored in Lake Mead. There are no evaporation losses charged to stored System Efficiency ICS. Metropolitan may take delivery of as much as 24 TAF of this System Efficiency ICS resulting from pilot operation of the Yuma Desalting Plant and 25 TAF of this System Efficiency ICS resulting from construction of the Drop 2 (Brock) Reservoir annually. The USBR may reduce this delivery if it determines a reduction is necessary to avoid a shortage.

Binational ICS is provided for through domestic agreements related to Minutes to the 1944 Treaty between the United States and Mexico. Metropolitan received 23.75 TAF of Binational ICS in Lake Mead in 2017 under Minute 319. Under Minute 323 Metropolitan will receive 27,275 AF of Binational ICS in Lake Mead between 2020 and 2026.

Additionally, under the California ICS Agreement, rather than storing conserved water in Lake Mead, IID may, with the written consent of Metropolitan, have up to 25 TAF of this water delivered to Metropolitan for storage in any one calendar year. Upon request by IID, Metropolitan would return 90 percent of the stored water to IID with the remaining 10 percent left for Metropolitan's use. A 2015 Amendment allowed IID to increase the amount of water it could deliver to Metropolitan for storage from 2015 to 2017. Metropolitan would return 95 percent of the stored water to IID, with additional 3 percent reductions in return obligation each year starting in 2020. Also, Metropolitan may make temporary use of IID's Extraordinary Conservation ICS accumulated in Lake Mead. As of January 1, 2020, Metropolitan has stored approximately 168 AF of IID's conserved water.

Rationale for the Expected Supply

Program Facilities

This program makes use of Lake Mead and the CRA.

Historical Record

From 2006 to 2010, Metropolitan created approximately 201.5 TAF of Extraordinary Conservation ICS.

In 2008, the USBR assigned to Metropolitan 100 TAF of water stored in Lake Mead as System Efficiency ICS due to Metropolitan's contributions to the Drop 2 Reservoir project, and Metropolitan diverted 34 TAF of that water.

In 2010 and 2011, the USBR assigned to Metropolitan 16.75 TAF and 7.647 TAF of water stored in Lake Mead as System Efficiency ICS, respectively, due to Metropolitan's contributions to the Yuma Desalting Plant pilot project.

From 2011 to 2012, Metropolitan created approximately 348.7 TAF of Extraordinary Conservation ICS.

From 2013 through 2015, Metropolitan took delivery of approximately 475.6 TAF of Extraordinary Conservation ICS.

From 2016 to 2019, Metropolitan created approximately 896.7 TAF of Extraordinary Conservation ICS.

In 2017, Metropolitan received 23.75 TAF of Binational ICS.

As of January 1, 2020, Metropolitan's Extraordinary Conservation ICS, System Efficiency ICS, and Binational ICS volumes in Lake Mead were approximately 866 TAF, 89.4 TAF, and 23.8 TAF respectively, and no DCP Contributions to Lake Mead have been required.

Written Contracts or Other Proof

2007 Lower Colorado River Basin Intentionally Created Surplus Forbearance Agreement among the Arizona Department of Water Resources, PVID, IID, the City of Needles, CVWD, Metropolitan, SNWA, and the Colorado River Commission of Nevada. This agreement sets forth the rules under which ICS water is developed, stored in, and delivered from Lake Mead. It also provides for IID storing conserved water with Metropolitan under certain conditions.

2007 California Agreement for the Creation and Delivery of Extraordinary Conservation Intentionally Created Surplus among Metropolitan, PVID, IID, CVWD, and the City of Needles. This agreement determines the conditions under which California contractors receiving Colorado River water may store and deliver water from Lake Mead.

2007 Agreement among the United States, the Colorado River Commission of Nevada, and the SNWA for the Funding and Construction of the Lower Colorado River Drop 2 Storage Reservoir Project. This agreement provides for: the United States to design and construct the Drop 2 Storage Reservoir Project; SNWA to fund the capital cost of the Project; the United States to credit SNWA's ICS account with 600 TAF of System Efficiency ICS; and allows Metropolitan to become a party to the agreement, requiring that Metropolitan provide funding for a portion of the capital cost.

2007 Delivery Agreement between the United States and Metropolitan. This agreement provides the procedures for creating ICS water and guarantees delivery of the water to Metropolitan.

2008 Metropolitan Notice of Election to Participate as a Party to the Drop 2 Funding Agreement. This notice requires Metropolitan to provide funding for a portion of the capital cost of the Drop 2 Storage Reservoir Project, and the United States to credit Metropolitan's ICS account with 100 TAF of System Efficiency ICS, reducing the amount of System Efficiency ICS in SNWA's account by an equal amount.

2009 Agreement among the United States, Metropolitan, the Colorado River Commission of Nevada, SNWA, and the Central Arizona Water Conservation District for a Pilot Project for Operation of the Yuma Desalting Plant. This agreement provides for the allocation of the costs for the preparation and pilot operation of the Yuma Desalting Plant.

2010 Yuma Desalting Plant Pilot Project Delivery Agreement between the United States and Metropolitan. This agreement secures delivery of the ICS water created and specifies the manner in which this water will be accounted.

2012 Agreement among the United States, Metropolitan, the Colorado River Commission of Nevada, SNWA, and the Central Arizona Water Conservation District for a Pilot Program for the Conversion of Intentionally Created Mexican Allocation to Intentionally Created Surplus. This agreement provides for the allocation of the costs among the agencies for the implementation of pilot conservation projects within Mexico and the allocation of 95 TAF of conserved water among the non-federal agencies as Binational ICS in Lake Mead.

<u>2012 Interim Operating Agreement for Implementation of Minute No. 319 of the International Boundary and Water Commission.</u> This agreement among the United States, the Upper Basin states, and Lower Basin states' agencies, including Metropolitan, sets forth the rules under which Intentionally Created Mexican Allocation is to be converted to Binational ICS for storage in and delivery from Lake Mead.

<u>2012 Lower Colorado River Basin Forbearance Agreement for Binational Intentionally Created Surplus.</u> This agreement among the state of Arizona, the Colorado River Commission of Nevada and SNWA, and California Colorado River water contractors, including Metropolitan, ensures that the Binational ICS made available to a contractor that invests in a project in Mexico cannot be claimed by another contractor in another state.

<u>2012 Binational ICS Delivery Agreement.</u> This agreement between Metropolitan and the United States secures delivery of the Binational ICS water made available by exchange and specifies the manner in which this water would be accounted.

<u>2013 Agreement between Metropolitan and IID Regarding Binational Intentionally Created Surplus.</u> This agreement allows IID to provide a payment to Metropolitan of up to 50 percent of the financial contribution to be made to the United States by Metropolitan for the implementation of pilot conservation projects within Mexico. As a result of IID's payment, Metropolitan received 23.75 TAF and IID received 23.75 TAF of Binational ICS in 2017.

<u>2015 Amendment 2 to the California Agreement for the Creation and Delivery of Extraordinary Conservation Intentionally Created Surplus.</u> This agreement between Metropolitan, PVID, IID, CVWD, and the City of Needles increased both IID's put capacity and cumulative capacity limits on storing conserved water with Metropolitan during the three-year period from 2015-2017.

<u>2017 Agreement among the United States, Metropolitan, the Colorado River Commission of Nevada, SNWA, IID, and the Central Arizona Water Conservation District for a Pilot Program for the Conversion of Mexico's Water Reserve to Binational ICS.</u> This agreement provides for the allocation of the costs among the agencies for the implementation of pilot conservation projects in Mexico and the allocation of 109.1 AF of conserved water to the non-federal agencies as Binational ICS in Lake Mead.

<u>2017 Interim Operating Agreement for Implementation of Minute No. 323.</u> This agreement between the United States, the Upper Basin states, and Lower Basin states' agencies, including Metropolitan, sets forth the rules under which Intentionally Created Mexican allocation is to be converted to Binational ICS for storage in and delivery from Lake Mead.

<u>2017 Binational ICS Agreement.</u> This agreement between the state of Arizona, the Colorado River Commission of Nevada and SNWA, and California Colorado River water contractors, including Metropolitan, ensures that the Binational ICS made available to a contractor that invests in a project in Mexico cannot be claimed by another contractor in another state.

<u>2017 Binational ICS Delivery Agreement.</u> This agreement between Metropolitan and the United States secures delivery of the Binational ICS water made available by exchange and specifies the way this water would be accounted for.

<u>2019 Lower Basin Drought Contingency Plan.</u> This agreement creates additional guidelines under which ICS water is developed, stored in, and delivered from Lake Mead.

I. Metropolitan/Bard Seasonal Fallowing Program

Source of Supply

At its December 2019 meeting, Metropolitan's Board authorized a 7-year seasonal fallowing program with the Bard Water District (Bard). Under the program, participating farmers in Bard are being paid to reduce their water use by not irrigating a portion of their land. A maximum of 3,000 acres can be fallowed in any given year. Under the terms of the QSA, water savings within the Bard service area are made available to Metropolitan. Bard Unit, as part of the Yuma Project, has the first priority for Colorado River water under the water delivery contracts with the USBR. Implementation of the program began in March 2020.

Expected Supply Capability

It is estimated that the Seasonal Fallowing Program would provide up to 6 TAF per year of additional Colorado River water. This water would be available in any year as needed and in accordance with the provisions described in the agreements with Bard Unit farmers and Bard.

Rationale for the Expected Supply

Historical Record

Metropolitan and Bard tested the concept of developing a water supply for Metropolitan by entering into agreements for a two-year Metropolitan/Bard Water District Land Management and Seasonal Fallowing Pilot Program. Agreements were signed with farmers, with written consent from landowners if leasing land, in the Bard Unit to forego irrigation for two summers between March and July in 2016 and 2017. Water unused by Bard was about 2.3 TAF and was stored in Lake Mead for Metropolitan. Bard was issued a categorical exemption for the Proposed Metropolitan/Bard Seasonal Fallowing Pilot Program in January 2016.[13] Implementation of the program began in March 2016.

Written Contracts or Other Proof

December 2019 Agreement for the Implementation of a Seasonal Land Fallowing Program. This agreement establishes the Bard/Metropolitan Program, which provides for a solicitation of farmer interest in participation in the program, specifies the process for incorporating eligible lands into agreements with farmers, and states the terms and conditions for fallowing, including payments made by Metropolitan.

Agreement for Seasonal Fallowing in Bard Unit (Farmer Fallowing Agreements). These agreements specify the process for farmers in the Bard Unit to participate in the Program. These agreements establish the fallowing period, the eligibility criteria for the fallowed land, the farmers' fallowing obligations, payments to be made by Metropolitan, and the land management measures to be implemented.

May 2020 First Amendment Agreement for the Implementation of a Seasonal Land Fallowing Program. This amendment clarifies Metropolitan's method of calculating fallowed acreage for the Program. To ensure Metropolitan only provides funding to lands that could have been otherwise irrigated, the amendments defines which acres within the Bard Unit are "fallowable" and therefore eligible for participation in the Program. The parties did not make changes to the Metropolitan Board-approved terms of the original December 2019 agreement.

[13] SCH Number 2001101149.

Financing

Metropolitan's annual O&M budget (referenced above) includes the cost of the Metropolitan/Bard Program. Metropolitan will provide an annual incentive per acre of irrigable land fallowed. The agreement provides for escalating the incentive every year using the Consumer Price Index. Metropolitan will pay for 75 percent of the incentive to the participating farmer and 25 percent to Bard.

J. Exchange with SDCWA

Source of Supply

SDCWA has acquired conserved Colorado River water reaching an annual volume of 277.7 TAF by 2023. SDCWA makes this water available at Lake Havasu for Metropolitan diversion, where Metropolitan takes possession of the water and provides a matching volume from Metropolitan's blended supplies to SDCWA by exchange in equal monthly amounts. The conserved water is acquired by SDCWA through its transfer agreement with the Imperial Irrigation District (IID) and from the lining of the All-American and Coachella canals.

Under the transfer agreement with IID, the stabilized annual transfer volume of 200 TAF is generated from conservation of water through on-farm efficiency conservation arrangements made by IID with its customers and other system efficiency measures.

The Coachella Canal Lining Project consists of a 35-mile concrete-lined canal, including siphons, which replaced an earthen canal. The project was completed in December 2006 and conserves 30,850 AF annually. The All-American Canal Lining Project consists of a concrete-lined canal constructed parallel to 23 miles of earthen canal, was completed in 2009 conserving 67,700 AF annually.

Pursuant to the QSA and related agreements, the 98,550 AF of water resulting from these projects annually is allocated as follows: 16,000 AF to the San Luis Rey Settlement Parties in San Diego County, 77,700 AF to SDCWA, and 4,850 AF for Coachella Canal Lining Project mitigation, with the amount not needed for mitigation becoming available to SDCWA.

Expected Supply Capability

In 2021, the IID transfer to SDCWA reaches 205 TAF, reduces to 202.5 TAF in 2022, then stabilizes at 200 TAF per year in 2023, which will be made available to Metropolitan for exchange each year through 2047. At least 77.7 TAF of canal lining water will be made available to Metropolitan for exchange each year through 2112. After 2022, the annual volume SDCWA will make available to Metropolitan is limited to 277.7 TAF.

Rationale for the Expected Supply

Historical Record

The IID transfers to SDCWA began in 2003 for a volume of 10,000 AF and have ramped up each year thereafter according to a defined schedule, reaching 192.5 TAF in 2020.

Conserved water from the All-American Canal Lining Project first became available in 2008 when 7,385 AF was allocated to SDCWA, increased to 54,429 AF in 2009, reached 56,200 AF in 2010, and has continued at that volume through 2020.

Conserved water from the Coachella Canal Lining Project first became available in 2006 when 687 AF was allocated to SDCWA and ranged from 21,511 AF to 25,759 AF from 2007 through 2019.

SDCWA has made available to Metropolitan all of this conserved water at Lake Havasu, where Metropolitan took possession and managed the water at its complete discretion for the benefit of all member agencies. Of the volume received at Lake Havasu Metropolitan delivered an equal volume to SDCWA by exchange from a blend of sources that were available to Metropolitan at a price that is less than its full service rate.

Written Contracts or Other Proof

Amended and Restated Agreement between The Metropolitan Water District of Southern California and the San Diego County Water Authority for the Exchange of Water. This October 10, 2003, agreement provides for Metropolitan delivery of Exchange Water to SDCWA in exchange for conserved Colorado River water SDCWA makes available to Metropolitan at Lake Havasu.

Agreement Between Imperial Irrigation District And San Diego County Water Authority For Transfer Of Conserved Water. This April 9, 1998, agreement, as amended, provides for IID to conserve water for transfer to SDCWA and establishes the price SDCWA pays to IID for the conserved water.

Allocation Agreement. This October 10, 2003, agreement among the United States, CVWD, IID, SDCWA, Metropolitan, and the San Luis Rey Settlement Parties provides for the allocation of water conserved from the All-American Canal Lining Project and the Coachella Canal Lining Project, and Metropolitan's assignment to SDCWA of it rights to both canal lining projects.

Colorado River Water Delivery Agreement: Federal Quantification Settlement Agreement. By this October 10, 2003, agreement, among the Secretary of the Interior. CVWD, IID, SDCWA, and Metropolitan, the Secretary agreed to deliver IID-SDCWA transfer water and canal lining water allocated to SDCWA to Metropolitan's Colorado River Aqueduct Intake at Lake Havasu for diversion by Metropolitan.

Financing

Metropolitan's annual O&M budget (referenced above) incorporates the price that SDCWA pays for Metropolitan delivery of Exchange Water, which is less than Metropolitan full service rate.

K. Exchange with the United States

Source of Supply

The Coachella Canal Lining Project consists of a 35-mile concrete-lined canal, including siphons, which replaced an earthen canal. The project was completed in December 2006 and conserves 30,850 AF annually. The All-American Canal Lining Project consists of a concrete-lined canal constructed parallel to 23 miles of earthen canal, was completed in 2009 conserving 67,700 AF annually.

Pursuant to the QSA and related agreements, the 98,550 AF of water resulting from these projects annually is allocated as follows: 16,000 AF to the San Luis Rey Settlement Parties in San Diego County, 77,700 AF to SDCWA, and 4,850 AF for Coachella Canal Lining Project mitigation, with the amount not needed for mitigation becoming available to SDCWA.

The United States furnishes the 16 TAF allocated to the San Luis Rey Settlement Parties at Metropolitan's Colorado River Intake on Lake Havasu. Metropolitan takes possession of the water and by exchange delivers an equal volume of Metropolitan's blended supplies to SDCWA. By separate agreement SDCWA conveys the water to the San Luis Rey Settlement Parties.

Expected Supply Capability

So long as water conserved by the All-American Canal Lining Project and Coachella Canal Lining Project is allocated to and available for use by the San Luis Rey Settlement Parties, the United States will make 16 TAF available for diversion by Metropolitan in perpetuity.

Rationale for the Expected Supply

Historical Record

The allocation of canal lining water to the San Luis Rey Settlement Parties was 172 AF in 2006, 4,500 AF in 2007, 6,013 AF in 2008, 15,648 AF in 2009, and 16,000 AF each year thereafter. The United States has made this water to available for diversion by Metropolitan. Through May 31, 2017, all water furnished by the United States at Lake Havasu was available for use by Metropolitan for the benefit of all member agencies. Beginning June 1, 2017, Metropolitan took possession of the water furnished by the United States and managed that water at its complete discretion for the benefit of all member agencies and delivered an equal volume to SDCWA by exchange from a blend of sources that were available to Metropolitan at a discounted price paid by the United States.

Written Contracts or Other Proof

Allocation Agreement. This October 10, 2003, agreement among the United States, CVWD, IID, SDCWA, Metropolitan, and the San Luis Rey Settlement Parties provides for the allocation of water conserved from the All-American Canal Lining Project and the Coachella Canal Lining Project, and Metropolitan's assignment to SDCWA of it rights to both canal lining projects.

Agreement Relating to Supplemental Water Among The Metropolitan Water District of Southern California, The San Luis Rey Settlement Parties, and The United States. This October 10, 2003, agreement provides that the United States will furnish to Metropolitan up to 16 TAF per year of water conserved by the canal lining projects for the benefit of the San Luis Rey Settlement Parties.

Financing

Metropolitan's annual O&M budget (referenced above) incorporates the price that United States pays for Metropolitan delivery of Exchange Water, which is less than Metropolitan full service rate, and the delivery of an equal volume by exchange to SDCWA.

L. Programs Under Development

Expansion of the Palo Verde Irrigation District (PVID) Land Management Program: Additional fallowing agreements may be developed in subsequent years as needed.

Quechan Seasonal Fallowing Program: The Quechan Indian tribe has expressed interest in participating in a fallowing program similar to the Bard Water District Seasonal Fallowing Program. Such a program is under consideration.

A.3.2 California Aqueduct Deliveries

A. State Water Project Deliveries

Source of Supply

The State Water Project (SWP) provides imported water to the Metropolitan service area and has provided from 25 to 50 percent of Metropolitan's supplies. In accordance with its contract with the Department of Water Resources (DWR), Metropolitan has a Table A allocation of 1,911,500 AF per year under contract from the SWP. Actual deliveries have never reached this amount. The availability of SWP supplies for delivery through the California Aqueduct over the next 18 years is estimated according to the historical record of hydrologic conditions, existing system capabilities as may be influenced by environmental permits, requests of the SWC, and the SWP contract provisions for allocating Table A, Article 21 supplies, and other SWP deliveries including San Luis carryover to each contractor. As shown in this 2020 UWMP, the estimates of SWP deliveries to Metropolitan are based on DWR's 2019 SWP Delivery Capability Report.

As part of its contract with DWR, Metropolitan pays both the fixed costs of financing SWP facilities construction and the variable costs of operations, maintenance, power, and replacement costs for water delivered each year. SWP water is delivered to Metropolitan through the East Branch at Devil Canyon Power Plant afterbay, along the Santa Ana Valley Pipeline, and at Lake Perris. Metropolitan takes delivery from the West Branch at Castaic Lake.

Expected Supply Capability

The Edmund G. Brown California Aqueduct transports Metropolitan's supplies from the SWP. The quantity of water available for export through the California Aqueduct can vary significantly year to year. The amount of precipitation and runoff in the Sacramento and San Joaquin watersheds, system reservoir storage, regulatory requirements, and contractor demands for SWP supplies impact the quantity of water available to Metropolitan.

Rationale for the Expected Supply

Metropolitan and 28 other public entities have contracts with the State of California for SWP water. These contracts require the state, through DWR, to use reasonable efforts to develop and maintain the SWP supply. SWP contractors have the right to participate in the system, with an entitlement to water service from the SWP and the right to use the portion of the SWP conveyance system necessary to deliver water to them. The state has made significant investment in infrastructure. It has constructed 28 dams and reservoirs, 26 pumping and generation plants, and about 660 miles of aqueducts. More than 25 million California residents benefit from SWP water. DWR estimates that with current facilities and regulatory requirements, the project will deliver approximately 2.4 MAF under average hydrology considering regulatory requirements from the SWRCB Water Quality Control Plan, the USFWS and NMFS biological opinions and the CDFW Incidental Take Permit. In addition, these estimates incorporate 2018 amendments to the Coordinated Operations Agreement between the SWP and CVP.

On a yearly basis, DWR estimates the amount of supplies that are available for that year. Metropolitan uses a forecasting method for SWP deliveries based on historical patterns of precipitation, runoff, and actual deliveries of water.

Further, under the water supply contract, DWR is required to use reasonable efforts to maintain and increase the reliability of service to Metropolitan. As discussed in a subsequent section, DWR is participating in the Bay-Delta process to achieve these requirements.

Historical Record

The historical record shows significant accomplishments by DWR in providing its contractors with SWP water supplies. Through 2018, the SWP has delivered over 103 MAF to its contractors. The maximum annual water supply was delivered in 2017, and totaled 3.77 MAF, exceeding the previous record delivery of 3.75 MAF in 2005. In 2006 and 2011 the project delivered 3.7 MAF. DWR has continued to invest in SWP facilities to deliver water to its contractors.

Written Contracts or Other Proof

1960 Contract between the State of California and The Metropolitan Water District of Southern California for a Water Supply. This contract, initially executed in 1960 and amended numerous times since, is the basis for SWP deliveries to Metropolitan. It requires DWR to make reasonable efforts to secure water supplies for Metropolitan and its other contractors. The contract expires in 2035. In December 2018, Metropolitan signed a Contract Extension Amendment that would extend the contract term to 2085. The amendment is not effective until approval of the December 2018 validation action filed by DWR in Sacramento County Superior Court, which is still pending.

Financing

Metropolitan's payments for its State Water contract obligation are approved each year by its Board of Directors and currently constitute approximately a third of the annual budget.

Federal, State and Local Permit/Approvals

Operation of the SWP. The DWR is responsible for acquiring, maintaining, and complying with numerous federal and state permits for operation of the SWP. Metropolitan has been active in monitoring the issues affecting its contract with DWR.

EIR for the East Branch Enlargement. In April 1984, DWR prepared and finalized an EIR for the Enlargement of the East Branch of the Governor Edmund G. Brown California Aqueduct.

EIR for the Harvey O. Banks Pumping Plant. In January 1986, DWR prepared and finalized an EIR for the additional pumping units at Harvey O. Banks Delta Pumping Plant.

EIR for the Mission Hills Extension. In 1990, DWR prepared and finalized an EIR for the SWP Coastal Branch, Phase II and Mission Hills Extension.

East Branch Extension Project Phase 1. In 1998, DWR completed an EIR to extend the East Branch of the California Aqueduct to provide service to San Gorgonio Pass Water Agency. Phase 1 was completed in 2002.

State Water Resources Control Board Water Quality Control Plan for the San Francisco/ Sacramento-San Joaquin Delta Estuary (Bay-Delta WQCP), Sacramento-San Joaquin Bay-Delta Estuary Revised Water Right Decision 1641 (D-1641), March 2000.

National Marine Fisheries Service Biological Opinion on Long Term Operation of the Central Valley Project and the State Water Project, October 2019.

U.S. Fish and Wildlife Service Biological Opinion for the Reinitiation of Consultation on the Coordinated Operations of the Central Valley Project and State Water Project, October 2019.
